Apple-cart Politics

IN a recent interview to BBC, the Prime Minister, answering the question how she sees India without Indira, has confidently said that "somebody else will come up but there will not be any chaos or disturbance".

Does the reality warrant such confidence? Philosophically one can of course make the point that this great nation will not go under, whatever comes its way. But judging by the present-day scenario, it is difficult to visualise an orderly succession on the morrow of Indira Gandhi's departure. Those who glibly point to the change of government following the Congress defeat at the 1977 Lok Sabha election, and fondly hope for its repetition, are living in a state of senility; for, it is almost an impossibility for the Opposition parties today to knock together all the disparate elements to pull off a Janata *redivivus* even if all the three cantankerous characters miscalled its leaders disappeared from the scene. This is borne out by the pathetic exercise that has been going on for the last several months to bring about Opposition [illegible], an exercise which has [illegible] ingredients of a comic opera.

This burlesque aside, the two Communist establishments, both flaunting their respective wardrobes of Left-and-Democratic-Unity, have resumed their civil war of polemics as they are confronted with a deadlock over the question whether such unity should include the BJP in the crusade against Indira authoritarianism; while there is no sign of the CPM relenting from its Big-Brother sectarianism when dealing with friendly elements, whether it is the CPI or the Congress-S.

By standards of conventional party politics there is therefore not even the ghost of a chance of the Opposition making a bid for return to power by normal democratic means: to that extent, the possibility of an orderly succession replacing the present

Congress-I raj is remote indeed.

What will be the position of the Congress-I without Indira Gandhi? The senior members of the Congress-I fight shy of facing the question, while the junior or middle-level leaders are in a state of intellectual vacuum. Any objective assessment of this ruling party however makes it abundantly clear that it has not a single leader who can remotely expect to be acceptable to the country at large: a number of them can hold their own in their respective States, but none can be considered as even a poor successor to Indira Gandhi, nor could any of them be promoted by a caucus to keep the party together. Unlike her father, Indira Gandhi has no Lal Bahadur Shastri to succeed her, nor a Syndicate to bolster up such a Shastri.

The entire style of functioning within the Congress-I has generated not an awareness of the need for urgency on the question of succession, but an avalanche of sycophancy which has no precedent in our national politics. The sickening performance of the Congress-I Chief Ministers at the recent session of the National Development Council — where substantial portions of their speeches, all written out, offered homage to Indira Gandhi as their saviour — should by the perception of any intelligent leader be taken as a disturbing phenomenon. Fulsome adulation is no substitute for tested loyalty.

Besides, it is not really a question of loyalty to the leader but the responsibility towards the party, to ensure that succession does not disrupt the political process. When Lal Bahadur Shastri died in 1966, Kamaraj on behalf of the Syndicate rallied the Chief Ministers to thwart Morarji's bid for Prime Ministership, and made way for Indira Gandhi's accession to power. But the galaxy of Chief Ministers that adorn her court today, how many of them, if any, would be able to retain their own posts once she is not there, not to speak of helping to choose a new Prime Minister? And all of them — not certainly excluding the pick of the bunch, Babasaheb Bhosale — are her nominees. The manner in which some of the Congress-I Ministries are being allowed to function can by no means bring political stability, nor does it redound to the credit of the party leadership (which in effect means Indira Gandhi personally). To permit such rickety outfits as Karunakaran's coalition in Kerala or Gogoi's team in Assam to continue in office when they could command no sure majority is to invite the erosion of the parliamentary system itself. The fact that these two Ministries had ultimately to quit has brought no laurels for the Congress-I.

Trouble besets Indira Gandhi from other quarters, at least one of which was unthinkable a year ago. The suspension from the party of a Congress-I MLA in UP, Akbar Ahmed, is a significant pointer to the shape of things likely to come. This MLA, who was known to be a close associate of Sanjay Gandhi, planned a convention of Sanjayites, who have been left out in the cold. Though Dumpy (as this MLA is fondly called in his own circle) has been dumped, what is intriguing is the claim that he has been making about Sanjay's widow, Maneka Gandhi's involvement with the new move. Coming as this does soon after the sale of the journal that Maneka had been editing, to two prominent RSS members—both happening without the knowledge and consent of Indira Gandhi—a new dimension to the Prime Minister's worries can be discerned. Although nobody really knows the exact strength of the Sanjay *bhakts* among the Congress-I MPs, the Capital gossips put it as between 70 and 90 in Lok Sabha. This sizeable section of the Congress-I establishing links with the RSS is indeed an ominous development. The irony of it all was that Indira Gandhi's alienation from a good section of the enlightened including the Left took place largely because of the role that she permitted Sanjay Gandhi to play, and today the near-and-dear associates of the same Sanjay seem to be building bridges with her implacable adversaries.

All this adds up to a clearly perceptible drift in the Indira camp. Twenty-six months since her triumphant return to power commanding an unchallengeable majority in Lok Sabha, have seen not the consolidation of that victory but rather *its* erosion, and the pace of that erosion has been getting faster in the recent months.

KP 3822

Though Indira Gandhi has quite a few trusted Ministers, they do not form a team; certainly they cannot form a regency if anything happens to her. The rapport with once-friendly elements in the Opposition has not been forged while new alignments — unscrupulous as much as unpredictable — threaten to confront her, not only cutting into the parliamentary strength of the party she leads but adding to that of the diabolic elements among her political opponents.

It is time for Indira Gandhi to pause and ponder about the state of the nation over whose destiny she presides and the fragility of the establishment that she has so far set up. Not certainly for her to make the complacent claim — not even in a BBC interview — that everything will be lovely in the garden that she will be leaving behind.

COMMENTARY

TUs in a Tangle

The controversy over the Central Government's latest announcement on March 15 on four DA instalments; for Government employees, merger of part of DA with basic pay and computation of house-rent and city compensatory allowances on that basis, and deposit of DA arrears till February as well as additional HRA and CCA falling due from February 1, 1982, to March 31, 1983, in the employees' PF accounts, appears to be artificial, or at any rate unrealistic.

First of all, it seems unfair to describe what has been done as either "impounding" of arrears or "wage freeze." The four new instalments of DA will be paid in cash with effect from this month, only the arrears from August to February being deposited in the PF accounts of the employees. HRA and CCA will be based on the merged basic pay only from February 1, 1982, and the additional amount involved will go into the PF accounts till March next year, being drawable by the employees thereafter and being also payable in cash from then on. Thus the arrears will be in the PF accounts only for a clearly specified period of one year and will be available in lump sum at the end of that period if the employees should desire to withdraw it. It is difficult to see what is so objectionable about this arrangement, considering that immediate relief is also available, with the four new DA instalments being payable in cash from now on.

It is clear from the minutes of the meeting of the Standing Committee of the National Council of the Joint Consultative Machinery held on February 15, 1982, that there was an understanding on the following, with only one member present expressing opposition to "impounding" of arrears of DA and of additional HRA and CCA and another's letter to the same effect being produced. Nine representatives were present on the Staff Side. According to the minutes, "all members of the Staff Side present at the meeting, except Shri S.K. Vyas, signified their agreement to the proposals made by the Official Side for merger of DA with pay at average index level 320 and to the mode of payment of consequential HRA and CCA as also additional DA." The only difference between the March 15 announcement and the February 15 understanding is that the fourth instalment of DA was hanging fire at the Standing Committee meeting but has now been released along with the other three already acknowledged as due.

Comparing the minutes with the Finance Minister's statement it has to be admitted that the Minister's account of the understanding is faithful and that the Government has scored a point by announcing release of the fourth instalment of DA also. It is difficult to dispute the Government's contention that its "proposals are acceptable to the large majority of employees", even if the statement that "delay in the issue of orders would cause undue hardship to the serving employees and the pensioners" can be seen as an attempt to increase the difficulties that the various trade unions of Government employees are obviously facing.

A point that needs to be noted is that failure of the unions to agree among themselves led to a loss to the employees in the past year; merger of part of DA with basic pay was offered by the Government in January 1981, but both sides had maintained silence on the question thereafter. The fear of most members of the Staff Side of the Standing Committee that further delay in reaching a settlement would only lead to further loss to the employees and to their own consequent isolation was quite obvious, and quite justified in the circumstances. It is significant that while the Staff Side's consent was readily conveyed *orally* to the Cabinet Secretary, the written concurrence sought by the latter was not forthcoming. If these are the facts, who can blame the Government for going ahead on the basis of the understanding recorded in the minutes of the Standing Committee meeting? And to say that the majority of the employees are opposed to the settlement seems dishonest.

The Government has also announced other decisions. The upper limit of death-cum-retirement gratuity has been raised from Rs 30,000 to Rs 36,000 — a logical corollary to the merger of part of DA in basic pay. The DA payable to "senior officers entrusted with high levels of responsibility" (up to Joint Secretary level) has been raised substantially "as a one-time measure". This category includes judges, UPSC members and others also. There can be reservations about increasing emoluments at higher levels, but that leads us to a series of other issues vis-a-vis the administration and the political leadership.

The important thing to note in these developments is the pathetic plight to which the trade unions have reduced themselves in relation to Government employees and their organisations. For a year they did nothing to get the Government to implement its offer of merger of DA with basic pay. Those who are shouting loudest against the latest announcement made no effort even to mobilise the employees on the basis of concrete demands of their own. At the Standing Committee meeting the two dissenters did little more than object to "impounding" of arrears, certainly an odd expression, given the context. Even at the earlier informal meeting of the JCM on January 28 the Cabinet Secretary had presented the Government's formula and no one had opposed it; it was taken to have been agreed to by both sides. But subsequently two top CITU leaders issued a statement to the effect that the formula was being "imposed" on all the employees and insinuating that "some" leaders of the JCM were virtually in collusion with the Government. This is precisely where the crisis started developing in recent weeks. And S.K. Vyas's stand on February 15 was the sequal.

But the gentlemen who raise such ghosts should in fairness explain what they themselves did by way of initiative when the merger offer first came from the Government well over a year ago. It was open to them to have brought about a consensus and forced the Government to accept the employees' terms. There has not even been an effort to mobilise the Government employees on either trade union issues or issues of public concern, so much so that now, on the DA merger and related matters, they are in no position to give a call to the employees not to accept the additional amount that will be paid next month. By adopting a a pseudo-radical and totally unrealistic posture such leaders are only isolating themselves from the Government employees, and from working people generally.

Ironically, this is the price the trade union movement pays for engaging in internal competition in economism. Organised workers have come to expect from the movement not a massive struggle to change the socio-economic structure but only agitations to increase their own individual pay packets. There has been no attempt to relate the trade union movement to the common and pressing demands of the working people as a whole, most of them unorganised, poverty-stricken, denied even statutory minimum wage, at the mercy of landlords, moneylenders and employers. Theoretical support for the demands of these unorganised workers has not led to their mobilisation by the trade unions except perhaps in stray pockets. This suits the ruling elites who have been making systematic attempts to divide urban and rural workers more and more, whether under Janata rule or under Congress-I rule.

It is the Government's failure to keep the prices of essential commodities at reasonable levels that is reflected in the steadily increasing commitment of public funds to meet partially from time to time the erosion in real wages of its own employees. Add the continuous flow of concessions and financial assistance to big industry and big farmers, and the calculated deflection of public funds to the better-off sections, ignoring the pressing needs of the majority, becomes evident. And the worst part of the situation is that the trade union movement under its present leadership is playing the game of the ruling class according to the latter's rules.

Will our labour leaders learn the lessons? Will Government employees and other organised sections realise that they cannot preserve themselves in isolation? And will the "representative" Government understand that by pampering vested interests and silencing organised workers with crumbs it cannot build a strong nation?

March 17 *C.N. Chitta Ranjan*

Kerala Capers

WHATEVER his motive, the hitherto unknown Lonappan Nambadan has rendered signal service to Kerala by walking out of the Congress(I)-led United Democratic Front, forcing the resignation of the untenable Karunakaran Ministry, dissolution of the State Assembly, and imposition of President's rule — all in the space of two days — and making the ordering of fresh elections inevitable.

The State Governor, Jothi Venkatachellum, who now, after some pointless hesitation, has recommended the steps taken, should indeed have done it at the end of December last. It was quite clear even then that neither the UDF nor the LDF was in a position to provide a stable or viable Government. Karunakaran was allowed to form a Ministry even before he was in a position to demonstrate majority support in the Legislature or his ability to run the Government without pathetic dependence on the Speaker's casting vote. It was clearly the Congress-I Front's effort to be in *direct* control of the administration at the time of elections, and the Governor compromised her constitutional responsibility of being unamenable to partisan pressures. Now the inevitable has been forced upon her — and upon the Centre.

When the Karunakaran Ministry was formed, towards the end of December last year, many had wondered if it would last longer than the first Karunakaran Ministry (March-April 1977)which was in office for thirty days; the second Ministry headed by the Congress(I) leader lasted eighty days, but this was because of the unprecedented utilisation of the Speaker's casting vote just to keep the Government going in an evenly balanced Assembly. Now the Governor has reported that no stable alternative Ministry could be formed; she should ask her conscience whether the same was not the state of affairs when she blithely permitted the UDF to form the Government in the first place; indeed, she should ask herself if the position then was not worse than this time since the Opposition LDF does boast the addition of one member to its ranks now.

Karunakaran's boast about an unidentified potential defector up his sleeve is patently so much hot air. His pious declaration that he was submitting his resignatian only because he did not want to cling to office with the help of a defector is so utterly hypocritical as not to warrant serious comment. His whole UDF set-up would have been impossible but for the high-power horse-trading in December with blessings and active support from Delhi. It hardly lies in the mouth of Karunakaran to talk about defectors. He should at least remember what his supreme leader told the Opposition in another context — that they should not adopt a holier-than-thou attitude.

However, it is good that at last the right decision has been taken. The LDF complaint that the formality of asking it to try to form a Government was not observed by the Governor, need not be taken seriously. The LDF leaders know quite well that they can fare no better than the UDF in the prevailing circumstances and they have in fact been demanding fresh elections. And if it would be immoral to allow the UDF to be in office during elections, considering its showing in the Assembly, it would be equally immoral to allow Tweedledee to take the place of Tweedledum. The people of the State are no doubt happy at the developments, even if it means President's rule for the seventh time. The electorate has another chance to give the State a viable Government. Since its inception in 1956 Kerala has had twelve Ministries, six of them in the last five years. The State, with its numerous problems, is sorely in need of a change from the constant state of uncertainty that has dogged it over the years.

It is hoped that the elections will be held without undue delay and that President's rule will mean careful avoidance of misuse of either the administrative machinery or the decision-making processes to influence the outcome of the vote. Again, it will be hoped by all democratic forces within and outside the State that at the coming poll principled and programme-based groupings will confront one another, so that the kaleidoscopic character that has marked recent coalitions there will be eliminated and the voters will be able to exercise their franchise in the confidence that whichever side is given a majority in the Assembly it will not lead to a *kichri* government, to use Indira Gandhi's description of the Janata regime at the Centre in the past.

There is urgent need for rethinking on the part of all parties and groups in the State. The coming exercise towards reorganising and strengthening the LDF and the UDF should be purposeful; all parties concerned approaching it with the interests of the State at heart, not driven by partisan interests or prejudices. The Communists on the one side, especially the Marxists, and the Congress (I) and its current allies like the Antony group on the other, should think in terms of fresh and meaningful initiatives that can lead to credible formations capable of providing a viable and progressive administration to the long-suffering State of Kerala. The lessons of the bitter experiences of recent years must be closely studied and digested. The dangers inherent in the recent emergence of communal and fascist elements in the South must be borne in mind. If the political forces in the state, especially the leading Left and democratic parties and groups, fail to see the need to offer clear-cut alternatives to the voters, the consequences can be disastrous for Kerala and the country.

Everyone is watching with interest how soon the electoral process will be set in motion and how the various parties and groups will work out the alternatives that will be available to the electorate in Kerala. The State and its people deserve a better deal than they have had till now, except for a spell of about seven years under Achutha Menon.

C.N.C

March 18.

Of Wars and Pacts

Major-General D.K. PALIT

THE recent Rao-Shahi talks (the subsequent contretemps notwithstanding) as well as a spate of articles by Indian visitors to Pakistan bearing witness to the fund of goodwill for our country that exists there, have raised great expectations in the sub-continent. After three major conflicts and more than thirty years of mutual suspicions a new era must surely be dawing, one in which we can leave all that behind and enter a period of detente, goodwill and lasting peace.

In this near-euphoric climate even to question the wisdom or the value of a no-war pact seems to border on hawkishness. Bad enough that the first approach was handled in such a gauche manner; now that the negotiations have got going let us not batch it by casting aspersions on each other's motives at the outset. That, at least, is the general mood in India at this time.

It is unfortunate that much of the discussion appearing in the press on these pact negotiations appears to presume that there are two opposing issues — to have or not to have a no-war pact with Pakistan. Furthermore, the general opinion seems to be that the people of India (and, indeed, of Pakistan also) are eagerly waiting for the pact to be signed whereas for some obscure reason it is the Government that is reluctant to enter into a no-war understanding. "The no-war pact which had raised the hope of millions of people in the sub-continent", a recent article in a prominent daily asserted, "had been torpedoed (by our Government)."

Wars and pacts, however, cannot be considered in simple, uncomplicated terms. For decades past a non-aggression (or no-war) agreement between India and Pakistan has been suggested and spurned. The fact is that a proposal to prevent wars between nations, though always welcome, cannot suddenly be wished into success. If any permanent and meaningful accord is to come out of the series of talks now under way many aspects of interrelationship must be examined in all their implications.

General Zia was not far wrong, only exaggerating, when on an occasion not so long ago he said that no-war pacts were not worth the paper they were written on. Looking back on recent history one sees that most (if not all) no-war pacts have eventually been disregarded and have ended in wars. The German-Russian Pact of 1939, the subsequent Russo-Japanese Pact and others have all ended up in the dust bin: they were merely stalling measures, postponements of planned conflict.

Just as there is a difference between a Cease-Fire and a Peace Treaty after a period of hostilities, there is a difference between a No-war Pact and a Treaty of Friendship during a period of peace. In each case, the former is essentially a tactical hold-off between adversaries; the latter is a more permanent political commitment, usually with built-in safeguards. Furthermore, a Treaty of Friendship is a cementing of relations between existing friends who perceive no *casus belli* between themselves: a no-war pact is entered between nations who acknowledge mutual or unilateral threat perceptions. If a no-war pact is to rid itself of its negative character and develop into a more lasting agreement, mutual threat perceptions must first be toned down; and then further confidence-building measures worked into the pact. This was the message Indira Gandhi was a signalling when she offered a Friendship Treaty to Pakistan last month.

The caution that India must excercise in conducting the present series of talks would be to ensure that Pakistan is not merely seeking a tactical hold-off, because such an arrangement would be entirely one-sided. India would gain little by a tactical hold-off at this juncture, whereas Pakistan would, both politically and militarily. For instance, the successful signing of a no-war agreement between our two countries would be a significant propaganda victory for the Pakistani President, an achievement that would go far toward reassuring those individuals in the US Congress — and they form a significant coterie — who oppose the present large-scale arms aid programme to Pakistan. It would also establish for General Zia a more favourable image at home than he has so far succeeded in creating. And militarily, it would gain much-needed time for him to complete his modernisation programme before renewing the Indo-Pak confrontation. As far as India is concerned, it stands to gain no advantage by a "temporary" pact: on the contrary, the signing of such a "stalling" agreement might well lull us into a false sense of security.

For India it is not a simple choice of having or not having a pact. India's interest in entering into negotiations must lie in the eventual conversion of a no-war pact into a more permanent treaty of friendship. The aim of such a treaty would be to whittle away mutual threat perceptions on Kashmir and other issues and to allay suspicions in political and economic areas. This must be done by gradually introducing mutual confidence-building measures into the pact, measures that would in time create a climate in which a settlement of issues by force of arms becomes an unlikely alternative.

This is not possible so long as Pakistan enters into a security agreement with the United States, whose anti-Soviet obsession makes its international policies basically hostile to India's. If Pakistan and India are to establish friendly ties, it must be done on a basis of non-involvement in the cold war — that is, on a basis of non-alignment.

Although Pakistan today claims to be non-aligned, the US Congressional Bill under which Pakistan will receive arms aid recommits it to the old anti-

(Continued on page 34)

China : Perspective for 1982

K.N. RAMACHANDRAN

THE year 1981 was not an impressive year for China. It achieved general overall progress and this is evident from the tone of the New Year's Day editorial of the *Peples's Daily* (January 1, 1982). It observed that the previous year was better than 1980 and 1982 will see "brighter prospect than last year."

In purely economic terms, China registered a modest growth of 3 per cent and this is less than what was anticipated in early 1981. The official media have admitted that in the industrial sector, production remained in a "passive state" for much of the year. In several critical sectors, the progress was normal or modest and conformed to the revised targets. Electricity generation registered a growth rate of 25 per cent and exceeded the planned target of 305,000 million KWh. It is not good enough, but it enabled the state to "basically" meet the needs of economic growth. There was the anticipated fall in heavy industrial production and oil production appears to have stabilised at 100 million tons. Coal production reached the revised target of 588 million tons. The original target was more than 600 million tons. iron (35.6 mn tons) steel (34.0 mn tons) and rolled steel (26.6 mn tons) production was more than what had been planned for but less than the production of 1980. Light industry, particularly those that produce consumer durables, showed considerable progress and it enabled the leadership to go forward with the business of satisfying the needs of the Chinese populace to a modest degree.

As regards agriculture, according to provisional official figures the production went up by 5.7 million tons despite floods in five provinces. This is certainly better than the performance in 1980 when production fell by more than 15 million tons. Thus, the agricultural sector has shown some recovery in relation to the performance in 1980.

Seen in this context, the tasks outlined by the leadership for 1982 are modest ones — suggesting the continuance of the policy of readjusting and restructuring the economy. In general terms, overall framework of "10 principles" elaborated at the Fourth Session of the National People's Congress (NPC) in December last, remains the bedrock of development. It may be noted that some of these principles tally with the report of the World Bank on China released in June last. What is likely to be new in the current year is the further amplification of the policies and other ongoing experiments in the light of the experience gained in the previous year. The changes in the production responsibility systems in the various sectors induced with a view to enhancing incentives for realising higher production may be, for instance, made more flexible and atractive than before. The evidence to this effect has been provided by the changes that are being contemplated in the commune system. Some critical experiments in this regard were introduced in Anhui province last year. According to a report, China is testing a plan to scrap the people's farm commune system and reorganise it into "Xiang" village system of the fifties with a view to improving agricultural productivity. In fact, Anhui is the province where Vice-premier Wan Li introduced the system of individual farmers undertaking their own farming on a modest scale. Thus, even if there is no immediate abolition of the commune system, there is likelihood of changes being introduced progressively on a nationwide scale with a view to decentralising agricultural production activity further.

Dr. Ramachandran is Junior Research Associate, Institute of Defence Studies and Analyses. This article is reproduced with due acknowledgement from *Strategic Analysis*, February 1982.

The tasks for the PLA in 1982 are also modest because of the cut in the budget for the conventional sector of the PLA. The reorganisation of PLA gained momentum in 1981 with demobilisation and retiring of aging cadres, and streamlining of training and administration. There were even reports suggesting that Vice-Chairman Deng would seek to reorganise main-force units. A campaign to ensure discipline and clear confusions among military personnel was also undertaken in earnest. In fact, China's military chief Yang Dezhi warned recently that if the PLA does not modernise quickly, it will become useless. It was also clear that a section of the PLA opposed, either tacitly or otherwise, some of Deng's reforms and forged solidarity with the conservatives in the leadership.

Seen in this context, the general tasks for PLA in 1982 are: (a) to uphold party principles — that is, accept whatever has been decided upon since the Third Plenum of the CCP held in December 1978; (b) Improve weaponry and speed up defence modernisation with the growth of national economy — that is updating of equipment and step-by-step growth; (c) strengthen relations among army, government and people, strengthen army's internal unity and strengthen militia (This means that cohesiveness within the army has not reached optimum levels, and that there is a lot to be desired in the interactions of the army with other sectors); (d) improve training and administration and strive to raise the capability of various arms of services to conduct coordinated military operations; and (e) Make a down-to-earth effort to prepare against wars of aggression.

In political terms, the current tasks were aptly summed up in an article in the theoretical journal *Red Flag* (December 16, 1981) entitled "Several Current Problems." These are related to the twin tasks of promoting national economy and a spiritual civilisation. It added that everything else should be "subordinated" to the realisation of these objectives. However, it was emphasised that the momentum required for this would be in terms of "the practical speed which can be attained by means of hard efforts." In this scheme, 5 per cent annual growth rate for industry is considered practical. However, the article exhorted the party to continue to conduct investigation, study, inspection and supervision. The *Red Flag* has also underlined the fact that there is a crisis of confidence in certain sections of the party, particularly among the younger generation. Hence it has pleaded for the restitution of revolutionary vigour. All these suggest that continuing the policy of party reorganisation will remain the cardinal tasks for the year.

This includes, holding of the Twelfth Party Congress, constitutional changes on the basis of 1954 Constitution, changes which would also incorporate experiences acquired since then, and the sorting out of issues arising as a result of the gerentocracy in the higher echelons of the leadership. In fact, Vice-Chairman Deng Xiaoping referred to all these — and other issues — in a talk with the visiting *Tanjug* delegation from Yugoslavia recently. He said that although the situation in the country was good, China had many problems. He added, "In order to achieve the objectives of four modernisations, we need stability and unity in the country. We must oppose some negative tendencies including bourgeois liberalism. Tendencies of anarchism and extreme egotism exist among our young people as a result of the 10 years of the chaos of Cultural Revolution. A long-term struggle against bureaucratism is necessary. We have a huge administration which is inadequately employed and therefore unproductive. However, reform of the superstructure is very complex and difficult and it is not easy to carry it out although we are determined to do soon."

DISCUSSION

Indian Development: Option and Choices

A STUDENT OF POLITICAL ECONOMY

The perspective of Indian development is fast becoming a matter of crucial concern for the polity of the nation. *Mainstream* has therefore felt the need for serious discussion on the state of our political economy and the options before the country. This contribution from a distinguished observer of the economic scene is meant to initiate such a discussion. The author has purposely chosen to be anonymous so that the discussion may not be hampered by any subjective bias. Readers of *Mainstream* are invited to participate in this discussion. —*Editor*

I

It is now more than thirty years since India started its experiment with economic planning.

The Indian economy is far more advanced today than it was in the early fifties. There has been a substantial agricultural growth and industrial development. Infrastructure has expanded both in quality and quantity. Industrial structure has diversified, with many units sufficiently strong and efficient to withstand the pressure of international competition. Many areas have absorbed, and some areas have developed sophisticated technology. Large sectors of agriculture have responded to increased application of inputs, water, fertiliser, pesticides as well as farming implements such as tractors and harvestors. Marketable surplus from agriculture has grown to sustain an increasingly larger population in industry and services.

But all these do not mean that India has succeeded in achieving what it sought to achieve through economic planning. There has been set-backs, and the policies pursued have not always been consistent with the requirements of the planning model that we adopted. We have remained desperately poor. The accelerating rate of growth that was envisaged through increasing investment resulting from expanding output of the machine-building sector has not materialised. The rate of investment has fluctuated, and unemployment has grown. The benefits of growth have not been evenly distributed. Even if the poor did not get poorer, the rich definitely have got richer.

It is not propose here to attempt any detailed exercise to explain these setbacks, but to discuss the Indian development and which way it is expected to evolve in the coming years in terms of general scenarios, drawn in broad outlines to give an overall picture. The purpose is to intiate discussions on two questions: What went wrong in our reaching where we are today; and where do we go from here.

To understand what went wrong in our process of development, I submit, we must appreciate the importance of politics in determining the course of economic development. Politics is ultimately concerned with wielding State power. But in its day-to-day operations, it is related to the interplay of pressure-groups, who are guided by their perceived interests, and who come in conflict or form coalition with each other, with respect to specific issues and within an institutional framework. In the long run, the nature of institutional framework, and the way these groups form themselves into classes, may be related to the growth of productive forces and production relations. But after Gramsci, no Marxist will deny some autonomy in their behaviour determined as much by tradition, ethos, and social values as thair basic economic interests and position in relation to productive forces.

It follows from this, that at a particular point of history a ruling group need not invariably and consistently represent a specific class or a permanent interest alliance. The group becomes the ruling group, in an institutional framework of elections and democratic government, by its ability to form the right kind of coalition of pressure groups which can give it the necessary support to capture and weild State power. That coalition may change depending upon the relative strength of the pressure groups at a particular time with respect to particular issues. To prevent a large increase in public investment, it becomes a combine of big bourgeoisie and big landlords. To enact land reforms, it becomes a coalition of small peasants and small and occasionally big bourgeoisie. It may, however, be not strong enough to overcome the strength of the landlords and enforce the reforms. To gain the support of large masses of workers, small entrepreneurs and the rural poor, the ruling coalition may introduce licensing regulations, MRTP Acts and bank nationalisation. It is futile to brand the ruling group as always representing particular interests, say of big bourgeoisie or big landlords, because then one would not be able to predict the behaviour of the group in particular instances.

The strength of the pressure groups which determines what policies are adopted; how effectively they are implemented and how long they are followed depends, of course, largely on their economic power. But it also depends upon their organisation, and ability to intervene in the political process and influence the behaviour of the ruling group. Since the ruling group rules through coalitions, it is always possible for even a minority group to influence its behaviour, if it adopts the right tactics. For as important and large a group as the working class or the parties representing it the scope for intervention is also very wide. But it has to understand the compulsion and interests of the ruling group and the overall objective limitations of the stage of development of productive forces. It may not bring about socialism overnight, if the growth of productive forces has not reached the appropriate stage. But it can definitely guide the developments, at least prevent its deviation, along the path of socialism.

Let it be emphasised that if the Left in India appreciated this logic of politics, instead of engaging in the sterile and perennial debate about the class character of the Congress Party, they would have been able to make much greater impact on our development. The Congress Party has always been, practically from its inception a coalition of interests. After Independence it was led by ruling groups, first around Jawaharlal Nehru, then around Indira Gandhi. Contenders for the leadership were many, but Nehru and Indira Gandhi became leaders because of their 'charisma' and ability to articulate the aspirations of Indian masses to get their support and votes. The coalition of groups they formed succeeded in retaining state power.

When Nehru launched the Five-Year Plans, particularly the Second Five-Year Plan, he was opposed by the vested interests, powerful sections of business class and landlords. So it was also when he adopted the Industrial Policy Resolution or when he goaded the State Governments to introduce land reform legislations. He was then successful in forging an alliance of all patriotic people, which included even some sections of business and landed interests, and middle classes and professionals, small and medium farmers and workers in general. But when it came to the implementation of the policies, he had to compromise again and again. In a partially planned economy, market forces continuously pressed for diversion of resources away from the Plan priorities. The vested interests that dominated the market forces proved too powerful for the Government edicts to be effective. A high rate of investment, which was a logical corollary of physical expansion of machine-building capacity, could not be sustained. Fiscal machinery proved too inadequate to mobilise requisite resources: land reforms were frustrated through leasing in and leading out of land and subterfuge transfers. Finances through the banking system kept feeding a small group of big business. No doubt, there was development of the economy. But it kept deviating from the "non-capitalist" socialistic path that Nehru's leadership sought to achieve for our economy.

The reason for this is mainly that the alliance which supported Nehru's introduction of the policies were not strong enough to withstand the pressures of the opponent vested interests, during the implementation of these policies. So the ruling group around Nehru, in order to remain the ruling group, had to compromise and form different coalitions with varying interests, at different times on specific issues.

The lack of strength of these alliances must be attributed to a great extent to the failure of the Left forces to organise them. If the groups forming that progressive alliance could acquire sufficient strength and leverage, with the Left playing an effective role in consolidating them, Nehru's leadership would have been strengthened and the policies of Plan development could have been more effectively implemented. The Left actually derived a lot of its own strength from the leadership provided by Nehru, but because of its inability to correctly gauge the balance of forces, the Left did not muster its strength to mobilise sufficient support for Nehru, when he faced the challenges of the vested interests.

The one area where Nehru's policy did not deflect from the principles propounded by him in the early 1950s, was foreign policy, with its anti-imperialist, non-aligned and nationalist stance. This was not so much due to the pressures of the Left forces as it was the reflection of a national consensus. In spite of the economic strength of the interest groups which were behind the Swatantra Party or the Jana Sangh, with all their anti-Soviet, pro-US affinities, they could not disrupt the national coalition of the groups bound by the anti-imperialist tradition of the Indian people. Nehru articulated their aspirations, and successfully translated them into his foreign policy. The Left benefited from this. But when after 1962 the vested interests turned all their pressures on to Nehru, the Left failed to rally sufficient strength behind him, Nehru had to compromise and sacrifice Menon. That he did not sacrifice non-alignment speaks of the strength of the forces of nationalism and anti-imperialism. It was no testimony to the strength of the Left alone.

If this perspective of Indian development is appreciated, it would be easier to understand the realities of the Indian situation today. Indira Gandhi has inherited the mantle of Nehru's leadership. But the world today has become much more complicated; the diverse interest groups in India have gained varying degrees of strength; and the compromises she has had to make have often been more glaring and severe than Nehru had to make in the fifties and early sixties. But the compulsions were the same — a necessity to form coalition of different interest groups so that the ruling group she was leading could continue to rule.

It is, however, possible to argue that Indira Gandhi in a sense went much further ahead compared to Nehru in championing the causes which could be identified with the pressure groups constituting the Left. Her position on the industrial policy and licensing; the role of the monopoly houses; bank nationalisation; foreign exchange regulations; controlling the operations of the multinationals; growth of indigenous technology; tremendous expansion of the public sector; emphasis on the schemes that benefit the rural poor, the

Scheduled Castes, the Scheduled Tribes and bonded labour; reorientation of the banking sector and incentives to the small entrepreneurs and the self-employed — all these are the ingredients of a policy framework which could be associated only with the alliance of the Left forces. Add to this her position on international affairs, the Indo-Soviet Treaty, the Bangladesh War, Diego Garcia, Vietnam and Afghanistan which have made her a symbol of anti-imperialism. To the people of the developing nations, Indira Gandhi's position today is much more unassailable than Nehru's position ever was. It will be a mistake for the Left to ignore this fact, whatever may be the factors that have contributed to this image of Indira Gandhi.

What is the basis of Indira Gandhi's leadership? The Congress(I) Party that she leads is not really a party in the sense of a political party of textbook theory. It is a group around her which derives its sustenance from her leadership rather than the other way round. This is possible because Indira Gandhi leads the large masses who support the Congress today and who had supported the Congress traditionally throughout our history. Whether one likes it or not, she has come to symbolise the spirit of the Congress Party, and it is that which has given her the 'charisma', the appeal to the masses.

One must try to analyse the importance of this phenomenon, if one is to understand the nature of India's politics today. Whatever may be her personality, her likes and dislikes or predilections, Indira Gandhi has become a historical force. The essence of that force is her appeal with the masses which is derived from her becoming the symbol of the tradition of India's development over the last fifty years, based on nationalism, anti-imperialism and self-reliance. Very few people in India will now believe that she can be dictated to by any imperialist power, that she can compromise our sovereignty, that she can give up the interests of India, that she can allow petty, regional, communal caste and sectional considerations to weaken the fabric of the Indian nation, that she will allow India to become dependent on any forces outside the country. To this image, which she has inherited from the traditions of the Congress, she has added her own contribution of *garibi hatao*. Anybody who has seen the faces of the millions that crowd around her, wherever she goes, would realise how strong is the appeal of the image, how the downtrodden, the poor and the weak, fondly believe that somehow it is she and she alone who can deliver the goods.

It is not necessary for our purpose to debate about the veracity of these beliefs. It is the perception of the people which matters, in giving this mass support which is the basis of Indira Gandhi's strength and which has, time and again, brought her back to power through the democratic electoral process. Since, as a political being, she is legitimately interested in retaining power, it would follow that she cannot afford to sacrifice the basis of this 'charisma' or image. She may have to compromise here and there, pacify some interest groups who have become overly powerful in a particular context, and shuffle and reshuffle the people around her to maintain the coalition of forces that would allow her to exercise state power after she has secured it through the electoral process. But it is hardly possible that she would alienate herself from her base, which is her popularity with the masses.

What is her position, vis-a-vis the institutions of democracy in politics and the monopolistic forces in economics? If the analysis presented above about the nature of her base is correct, the answer to this question will be unequivocal. She has to rely on democratic institutions because that is the only way the support of the weak and non-privileged masses can bring her back to power. The only time she lost her power was when, for whatever reason, the masses got alienated from her, and her opponents used that opportunity to strike at her. It should now be clear to her that only through the democratic institutions she can counter-balance the very powerful interest groups who, in spite of their being in the minority, wield strong leverages. In the same manner, she has to be against the dominance of monopolistic forces in the economy, because that dominance would militate against her base with the masses.

To appreciate this last point, let us look at the potential of the Indian economy today. It would be difficult to deny that our economy now has reached a stage from which it is quite capable of launching on a path of rapid growth. Our industrial structure is sufficiently diversified, strong and efficient to sustain a mutually supporting growth of a number of industries simultaneously. We are capable of absorbing high technology and generating profits and investment. Our agriculture has shown a buoyancy even in the years of bad weather reducing the fluctuations in output and producing a reasonable amount of marketable surplus. There is a substantial capacity in our infrastructure which can be mobilised with better management to support a growing industry. The volume of household savings has increased very significantly over the planning years, which can now finance quite a high rate of investment. It may require some appropriate policy inputs, but an accelerated pace of growth is very much within our reach.

Will demand necessarily turn out to be a constraint on this development? If the process of growth becomes very lopsided, with increasing immiserisation of large sections of population, this might be a possibility. But otherwise the constraint of demand may operate only in specific sectors. It does not have to be a general overall constraint for our industrial development. Even if the bulk of our population live in abject poverty, there would be at least 200 million people, who are relatively well-off with a rate of consumption reasonably above the bare necessity of subsistence. That size of population can provide a very large market and can, in principle, sustain any modern industry. The hypothesis of general demand constraint, therefore can hardly be tenable. It can influence the nature of growth and the kind of industries that would develop. But it may not arrest the overall growth of industry.

(*Continued on page 32*)

Growth Possibilities in OECD Economies

An Alternative View

VIJAY LAXMAN KELKAR

In recent discussions there have been a number of projections indicating the growth prospects of the OECD economies, that is, advanced industrialised countries. For instance, the World Bank in its latest World and Development Report (1981) has projected that the growth rate of the advanced industrialised countries would be around 2.8 per cent per annum in the coming decade. UNCTAD's projections, given in its Trade and Development Report (1981), are even more pessimistic. The TDR has argued that in the next decade or so, the rate of growth in the developed market economy countries would be only 2.5 per cont per annum. (Classification of countries of UNCTAD and World Bank is not strictly comparable and there are marginal differences). It should be noted, as seen from Table I, that these growth rates are much lower compared to the post-War experience of advanced industrialised countries. For instance, between 1950 and 1970, average growth rates recorded by these countries has been around 5 per cent per annum.

Projections of the OECD's own "inter-futures project" also indicate that for the coming decades the growth rates are likely to be much smaller compared to the experience of the years 1950-1970. Their projections are essentially based on the assumption that the underlying long-term growth rate in overall productivity is going to be around only 1.8 per cent per annum. All these projections suggest that the growth rates experienced by the OECD economies during the post-War years, that is 1950-1970, are unlikely to be repeated. These kinds of conclusions have profound implications for the development prospects of the developing countries as shown in the Trade and Development Report of UNCTAD. In this papen it is suggested that it is possible to envisage much larger growtn possibilities for the OECD economies and consequently for the world economy.

What is the basis for such a perspective? In our view the basis lies in the new and basic technological innovations that are now available which can remove one of the key obstacles against expansion, namely. the retardatian in productivity growth. First we discuss the trends in overall and sectoral productivity increases in the OECD economies for the post-War years and identify the key features of these trends. Then we focus attention on the impossible impact of micro-electronics and new energy technologies on the acceleration of growth rates. In this latter part we also discuss the nature of new policy packages that would be required in the OECD economies. Obviously, growth rates of the OECD economies are very important in considering the problem faced by these countries themselves, that is, questions related to employment, energy transition, etc., but, importantly, these are also intimately linked to the political issues, that is, it can create a more favourable international environment both for international economic co-operation towards the restructuring of international economic relations and for world peace.

Experience of the twentieth century has shown that stagnation in the capitalist economies tend to get resolved through "militarisation" or wars and it is abundantly clear that both of these processes will have disastrous consequences for the developing countries and the developed countries. Hence, if the economies of the advanced industrialised countries show greater dynamism the risk of wars and international tension could then be minimised and the consequent process of "demilitarisation" can only have positive impact on the development prospects of the developing countries in terms of (i) giving them a much greater degree of freedom in pursuing needed internal reforms, and (ii) in having far more supportive measures from the advanced industrialised countries and the socialist countries.

WHILE projecting future possibilities it is clear that the movements in the growth rate of productivity seem to be central. Historically, gains in per capita productivity through capital accumulation, augmentation of human capital and technological progress or innovations have been the main spring of modern economic growth. Equally, all recent works such as those of Kendrick, Maddison, etc., on growth experience of the advanced industrialised countries show that a tremendous growth in pro-

The author is Economic Adviser, Ministry of Commerce. He is, currently working as a Consultant to UNCTAD, Geneva. The views expressed in this article are the author's own and do not necessarily reflect the views of the organisations with which he is associated.

ductivity has been the driving force behind OECD expansion of the post-War years.[1] (See Table II). Hence, it is necessary to study the developments in growth rates in productivity during the last 30 years so that one can identify the sources of growth for the future.

When we talk about productivity, we are focusing our attention here on labour productivity, that is, output per unit of labour input. Admittedly, this is not an entirely adequate concept in understanding or identifying fully the technological progress. For that purpose it is the concept of "total factor productivity" which is more appropriate, as this concept captures the contribution of all other inputs, for example capital. It should be noted that technological progress means more than growth in total factor productivity as it could also imply the introduction of new products. However, the measurement of the total factor productivity is much more difficult and date are not available for all the sectors nor for all the economies of the OECD countries.[2] Hence, we have to restrict ourselves to a "partial measure,', that is, discussions of trends in labour productivity.

Most observers seem to agree that there are two distinctive phases in the post-War expansion of the OECD countries: roughly speaking, the first phase lasts till the end of the decade of the sixties, in which the developed countries experienced a rapid rate of growth in capital accumulation, employment, per capita productivity and gross national product; and the second phase begins in the decade of the seventies, showing a substantial decline in all those variables accompanied by much accelerated rates of inflation. For instance, per capita productivity for major industrialised countries increased at the rate of 4.4 per cent per annum between 1950-1970 compared to only 1.8 per cent per annum during the period 1913-1950.[3] Calculations for the recent period have shown that this growth rate has suffered a decline during the decade of the seventies and this has been true for almost all OECD countries. For instance, in the United States, the rate of growth output per man-hour declined from 3.44 per cent for the years 1947 to 1966, to only 1.15 per cent per annum during the period 1973-1978.[4]

In Japan the productivity which grew at a rate of 7.9 per cent per annum for the period 1950-1970 declined to 5.7 per cent per annum during the years 1970-1979. In other words, there seems to be little doubt that the decade of the seventies has been a turning point in terms of growth in productivity in the OECD economies. It is important to understand the reasons for this shift. Most of the studies which have looked into these issues suggest that there have been various factors which have led to this change. Conventional analysis argues that the basic reasons lie in the growing constraints vis-a-vis the supply factors, especially in terms of the growing difficulties in supply of raw materials and energy, growing government regulation that hamper technological progress and capital formation, etc. There is no doubt that the rate of capital accumulation, especially in the form of plant and equipment, declined quite substantially in the second phase compared to the earlier years. For instance, in Japan this ratio of gross private fixed investment in the form of plant and equipment to GDP which had reached 21 per cent by 1970 declined to 16.3 per cent by 1978. There was a similar trend in other major economies such as in the USA where this ratio declined to 7 per cent by 1979.[5]

Thoughtful observers have also argued that until 1970 the rapid expansion of productivity reflected the "catching up" process where the economies of Western Europe and Japan essentially caught up with the levels of productivity that were obtained by the "best practice" technology in the United States (See Table III). This process of "technological diffusion" was achieved through, among other things, (i) increased trade liberalisation, (ii) creation of the Common Market, and importantly through (iii) maintenance of buoyant aggregate demand, etc. It is not clear whether it was trade liberalisation *per se* or much greater international flows of technology transfers which has been the main factor in accelerating technology diffusion. Perhaps it is the second factor, namely, greater flows in technology, which have been more important. However, this "catching up" process gave progressively lower returns as the technology frontier of the US economy which was the leading force in technological progress could not maintain its own underlying trend growth rate in productivity. In fact, if anything, the rate of growth of technological progress as reflected in the total factor productivity showed a considerable decline in the United States.[6] For instance, the United States' total factor productivity which reached a rate of 2.73 per cent per annum during the period 1959-1969, declined to 1.31 per cent per annum during the decade 1969-1978.[7]

It is sometimes argued that the declining trends in labour productivity need not indicate any decline in the total factor productivity, especially when there is a cyclical downturn in the aggregate demand. Needless to say, in the short run when employment may be "fixed" a decline in labour productivity is only "definitional". This is true only in the short run but what we are describing here is movement in labour productivity over the years and decades. It shall also be noted that sophisticated analysts such as Kendrick, Nadiri, etc., have taken into account the "demand" variable explicitly in estimating the productivity slowdown.[8] Although there is general agreement among these scholars about the qualitative aspect of this change, that is, direction, there is still considerable debate regarding the degree and source of slowdown in the productivity of the United States. There are various explanations including those put forward by some Marxist scholars who argue that one major reason for productivity slowdown lies in the intensity of the class conflict and in increased militancy on the part of the working class, especially against corporate bureaucratic controls which have been the major reason for this qualitative change.[9] On this issue there is a growing tendency to ascribe this change to the phenomena of cyclical downturn in a "long-wave" *a la* Kondratieff cycle. Kondratieff, a distinguished Soviet economist, was one of the first to point out the existence of such long cycles. This analysis was further refined and enriched by the contribution of J. Schumpeter who gave a central place to technological innovations and to the role of entrepreneurs in his scheme of analysis. Needless to say, these views have been challenged and as a recent critical review has pointed out the statistical foundations of existence of "long cycles" is quite weak.[10] Until recently, such a line of enquiry remained dormant but now there has been a revival of interest in this kind of analysis.[11] J. Forrester has shown possibilities of such cycles by his simulation of the advanced capitalist economies.[12] In his model such cycles are essentially due to interaction between demand for the capital goods sector and for the consumer goods sector. Marxist scholar E. Mandel gives a central role to the movement in the "rates of profit" in explaining such cyclical growth. In his model, technological innovations have a "triggering" effect on rates of profit and thus stimulate capital accumulation.[13] Another variation of the "long-wave" analysis of capitalistic growth has been put by Mensch who argues that the current stagnation is due to "technological stalemate" in the sense of lack of basic innovation.[14]

Although it may not be possible to fully subscribe to a "long-wave" type of analytical framework for the development of capitalism, in our view there seems to be little doubt that "technological innovations" play an important role in the accelerating trend rates and in defining the turning points in the capitalistic economy.[15] Of course, in addition to this important role played by technological innovation there are other important factors. However, the usual analysis does not adequately emphasize an extremely important explanation, and this lies in the structural shift of the OCED economies in terms of production and employment patterns where there has been a marked movement towards rapid growth of employment in the tertiary or services sector and in the fact that the services sector has shown a considerably lower growth rate in labour productivity, as well as perhaps in terms of total factor productivity (see Tables IV, V and VI). In other words, the differential nature of productivity gains amongst various sectors of the OECD economies has been the major cause of slowdown in these countries. This also had other macro economic effects. In fact, as we will show later, this has been one of the important causal factors in accelerating inflation in the developed market economy countries.

In this context it is possible to speculate that this phenomenon could also have had an adverse impact on the developing countries' trade by adversely affecting their terms of trade. This could have occured by shifting the burden of the growing

Table V

STRUCTURE OF EMPLOYMENT 1870-1976
(Average of 16 country shares)

	*Agriculture**	*Industry†*	*Services‡*
1870	48.8	27.5	23.7
1950	24.7	36.6	38.7
1970	10.9	39.0	50.1
1976	8.3	36.1	55.6

*Includes forestry and fisheries, †Includes construction; ‡Includes military.

inefficient "non-tradable" sector or services sector on the trade goods sector, that is, imports and exports of developing countries, by increasing their import prices and by reducing the f.o.b. realisation and thus adversely affecting their terms of trade. Of course, at this stage we put this forth only as a hypothesis on an *a priori* basis.

It is suggested that an increase in the supply price of the output of the services sector or "non-tradable" sectors, for example, finance, distribution, etc., can have an impact similar to the increases in "transport" costs or "freight" costs of exports and imports. In such a situation it is easy to see who would bear the incidence of such increases. It is known that in international trade the burden of freight rates or costs is shifted to the exporters depending on the supply elasticity and this share is higher if export supply is relatively more inclastic.[16] As A. Yeats has argued that given the structure of exports of developing countries, that is commodities with inelastic supply, the burden of transport costs will be shifted on to the exporters, thus depressing their f.o.b. realisation. The inverse is true in the case of their major imports from the developed countries, for example capital goods where c.i.f. prices of these imports would go up. The consequences of this process would obviously be an adverse movement in the terms of trade of developing countries.

The post-War years have seen remarkable shifts in patterns of employment in the OECD economies as seen in Table V. For instance, in 1950, the share of employment in the agricultural sector in total employment was around 24.7 per cent; in the industrial sector it reached 36.6 per cent and in the services sector 33.7 per cent. By 1970, the employment share of the agricultural sector went down to only 10.9 per cent while gains were made by both the industrial sector and the services sector in terms of shares in total employment. These shares accounted for 39 per cent and 50 per cent respectively of total employment. During the decade of the seventies, the employment share of both the agricultural and industrial sectors declined, while the share of the services sector in total employment showed a continuous growth and by 1976 their shares were 8.3 per cent, 36 per cent and 55.6 per cent respectively. Conceptually, the services sector consists of various sub-sectors which can be aggregated into two major sub-sectors—(i) market services would include the wholesale trade, retail finance, insurance, etc., and the non-market services would typically include these services predominantly coming from the public sector — such as education, health, municipal services, etc. In terms of employment, both these sub-sectors have experienced considerable growth. As far as Western Europe is concerned, there is evidence to show that this growth in employment may be much larger in the non-market services.[17]

The above data reflect the average percentage for 16 industrialised countries. For the advanced amongst them the shift towards the services sector has been even more dramatic. For instance, in North America employment in the services sector accounts for about 66 per cent, that is, two-thirds of the total labour force. These shifts in the employment pattern accompanied the shifts in the structure of production and consumption in the OECD economies. For instance, in 1979 the services sector accounted for almost 60 per cent of the gross domestic product of the OECD countries. These shifts have been due to various reasons and now this has generally come to be considered as a distinctive feature of the "post-industrial" society.[18] Although this paper will not go into these issues, that is, the issues related to the demand for services, it is clear that the rapid increase in employment in

the services sector has been due to its low productivity and to a relatively slower productivity gain in face of an expanding demand. In other words, increasing amounts of labour inputs are required for sustaining growth of output in the services sector and there is ample evidence to show these developments. For instance, according to a study of sectoral growth rates the output per person during the period 1950-1976 increased at a rate of 5 per cent per annum in the agricultural sector; 4.5 per cent per annum in the industrial sector and only 2.2 per cent per annum in the services sector (see Table VI), while in terms of increase in employment the services sector showed a growth rate of 2.3 per cent per annum compared to only 0.8 per cent per annum for the total employment growth rate.

Medical services	101.9	101.4	98.3	98.9
Postal service	98.3	99.4	105.9	115.6

Source: *US Bureau of Labour Statistics, Handbook of Labour Statistics, Annual.*

Table IV gives the rate of growth in labour productivity by different sectors in some Western European countries. This also shows that labour productivity in the services sector grew at a much slower pace compared with the manufacturing sector and this difference is quite substantial.

The recent experience of the United States, as seen in Tables VII and VIII, is no different. For instance, in the US the index for manufacturing output per man-hour increased between 1970-1978 from 104.5 to 130, while the output per man-hour for total non-farm business including manufacturing and the private market services increased from 103 in 1970 to only 115.5 in 1979. These two time-series clearly show that the output per man-hour in the services sector was much lower than that of the manufacturing sector. As far as the non-market services are concerned, according to US statistics, productivity per employee for federal civilian government employment increased from 104 in 1970 to only 117 in 1979, once again showing much slower gains in the productivity of the services sector compared with the goods-producing sectors.□

Paddy and Prosperity

M.S. SWAMINATHAN

ORGANISATION and diversification are the twin requirements for successful industrial development. These are also the same requirements which can make agriculture dynamic and profitable. I have chosen the theme "Paddy and Prosperity" for this lecture, because I would like to illustrate through this most important crop of India how organisation of production processes and diversification of post-harvest technology can help to make a staple crop also yield more jobs and income. However, before going into this specific example, I would like to briefly survey the agricultural scene as I see it.

Since Independence, our population has doubled itself from 340 million to over 680 million. During the same period, the production of foodgrains rose from about 50 million tonnes to about 134 million tonnes. Thus, foodgrain production has risen slightly above the rate of population growth. It is well known that progress in agriculture has been rather uneven with reference to regions as well as to crops. Punjab ranks first in productivity in wheat, rice and several other crops (Table 1). Some parts of the country have average yields which are only about 30 per cent of the average yield obtained in Punjab. This is partly due to differences in the area under irrigation but partly also this is due to the variations in management efficiency. Intra-State variations also exist. During 1966-67 to 1979-80, crop output increased in Punjab at the compound rate of 5.4 per cent per annum. The highest growth rates were achieved by Patiala (7.1 per cent) and Hoshiarpur (7 per cent) districts. Progress has also been different in different crops (Table 2), pulses registering the lowest growth rate in production. There are also differences between the progress made in the *kharif* and *rabi* seasons. The *kharif* season, when we receive nearly 80 per cent of the total rainfall in the country, has unfortunately been characterised by relatively much slower progress in production and productivity improvement as compared to the *rabi* season (Table 3).

Land is the most precious production factor in our country because of growing demographic pressures from both man and animal. Land is also a shrinking resource for agriculture because of competition for land from urban and rural expansion, road construction and industrial and other needs. Productivity advance and enhancement of production through higher intensity of cropping are the only two pathways available to us to meet our growing requirements of food, fibre, sugar and other crops. The introduction of high-yielding and relatively photo-insensitive varieties of rice and wheat made productivity improvement as well as multiple cropping possible. For example, if we had not made advances in productivity improvement in rice and wheat in the last 15 years, we will now need over 34 million hectares of additional land to produce the same quantities of wheat and rice which we now produce (Table 4).

While we can be happy about the progress made so far, we should take serious note of the fact that further improvements in production are becoming more and more difficult. For example, the Sixth Plan had fixed a target of 135 million tonnes of foodgrain production for 1980-81. We could, however, produce only about 130 million tonnes. The target for 1981 82 is 138.5 million tonnes and the achievement is likely to be about 134 million tonnes. The target fixed in the Plan for 1984-85 is about 154 million tonnes (Table 5). Will we be able to raise production by 20 million tonnes during the remaining three years of the Plan?

If we consider individual factors of production, we find considerable progress in the growth of irrigation facilities and fertiliser production and application (Tables 6 and 7). The Sixth Plan provides nearly as much allocation for the irrigation sector as was made in all the previous Plans put together. Our research and extension infrastructure has also grown. We have now good Agricultural Universities in all parts of the country and intensive extension systems. Pricing and marketing arrangements have also improved. Why then are we finding it difficult to realise the target of achieving the 5 per cent growth rate in agricultural production which we desire? (Table 8 and 9).

Weather continues to play an important role in determining our agricultural fortunes. In Punjab because of controlled irrigation, production can be stablised to a great extent provided energy management is done in an efficent manner. This can be seen from the data on fluctuations in rice production in the last few years in a few States (Table 10). In the areas covered under major irrigation projeets, this degree of stability is not visible. This is why the sixth plan lays stress on command area development and on-farm management of water. We should attend to the following aspects in the irrigation sector as speedily as possible:

(*a*) *Water management:* Scientific water management is possible only if the physical engineering features of an irrigation project and agricultural development are closely linked. In most of our irrigation projects, there exists a wide gap between the development and utilisation of the irrigation potential. This is unfortunate in view of the huge investments made in such projects. Our irrigation depart-

Dr Swaminathan is Member, Planning Commission. This contribution is the text, slightly edited, of the Lala Karam Chand Thapar Memorial Lecture he delivered on March 7, 1982, at the Thapar Institute of Engineering and Technology, Patiala.

ments have generally tended to concentrate on developing the irrigation potential. Commensurate attention to the development of the command area and to on-farm management of water is still not forthcoming in an adequate measure. An analysis of water management in 30 irrigation projects supported by the World Bank in different countries has shown that in only nine of the projects there was adequate attention to water management. The reasons for poor water-management vary from project to project but in general they are related to weak institutional performance, poor selection of water control equipment, inadequate farmer's participation and finanncial constraints. This emphasises the need for training and establishing a cadre of water technologists and managers, who could introduce a systems approach in irrigation.

(*b*) *Public policies*: Irrigation is a State subject under the Constitution and policies relating to water rates are evolved by the State Governments. According to the latest estimate, the loss from irrigation works amounted to Rs. 427 croers during 1979-80. At the current rate of loss, the total losses during the Sixth Plan period will amount to nearly Rs. 2,200 crores. Unless water is regarded as a valuable commodity, its wasteful use will persist. The question of introduction of changes in flow irrigation systems on a volumetric basis should be given serious consideration wherever this has not been done. Supply of water from tube-wells is being made on a volumetric basis in some States. Ideally, farmers' own co operatives should manage the water delivery system so that there is both equitable and economic use of water.

Another area which needs attention is legislative enactments in relation to irrigation. The Central Government had circulated a model irrigation bill and also a model Bill to regulate the exploitation of ground water. States which have not yet done so will have to review the existing legislation in the light of the suggestions contained in the model bills. A suitable machinery will also have to be developed for taking speedy and just decisions on inter-State water disputes.

(*c*) *Land and water use planning:* The Sixth Plan has suggested the setting up of Central and State Land Use Boards in order to assist farmers in taking to farming systems which are economically and scientifically sound. Such Land Use Boards can take advantage of modern techniques such as remote sensing while developing land use plans. The best fertiliser to the farmer is assured, and remunerative marketing. Therefore, the marketing and other post-harvest aspects of farming should receive adequate attention.

(*d*) *Farmers' participation:* Irrigation arrangements are made for the benefit of farmers. The users of water should hence have a total sense of participation in the conservation and management of the water resources. The existing administrative arrangements for water delivery are not tailored to generate this sense of involvement. Management of water should be a joint sector activity involving both Government and farmers. The existing structures of command area authorities need suitable modification to achieve this aim.

(*e*) *Inter-departmental coordination*: For efficient water use, it is obvious that the Irrigation, Agriculture and Electricity departments will have to function as members of a symphony orchestra. The existing linkages among these departments are rather weak and sometimes non-existent. Agricultural Universities and Research Institutes have also not been fully involved in water management. In fact, much before an irrigation project is due for completion, the Agricultural University should undertake anticipatory research on optimum water use pattern taking into consideration the soil and climatic factors. Unfortunately, because of the absence of such anticipatory research, we are not able to derive now full benefit from the water resources for several years after the creation of the resource.

(*f*) *Irrigating arid land*: The Rajasthan Canal is one of the largest man-made canals of the world in desert areas. It is designed to utilise 8 million acre feet of surplus Ravi Beas water for irrigating the arid zone of western Rajasthan. The project was started in 1958 and Stage I, which will help to irrigate 5.34 lakh ha. will be completed in 1983. Land use planning and cropping strategy in the entire Rajasthan canal area requires careful review.

(*g*) *Monitoring*: There is need for an integrated monitoring mechanism which will provide us with continuous information on the positive and negative impact of irrigation projects. The positive impact should be measured in terms of additional production per units of time and water. additional employment and income generated. There is no purpose in just giving figures on area under irrigation without an accompanying statement on the impact of water on productivity, intensity of cropping, diversification of labour use and agrarian prosperity. The analysis of the negative impact of irrigation should cover fields such as waterlogging, salinisation and erosion. The public health aspects should also receive equal attention, since there is growing evidence that irrigation projects could also lead to the spread of vector-borne diseases and sometimes cause nutritional disorders. Climatic impact studies of irrigation projects also deserve attention.

Efficiency of fertiliser use also varies widely. On a national average, we are assuming that the application of one kg of NPK fertiliser (in terms of nutrient) will yield 10 kg of grain. Experiments conducted in our Agricultural Universities, however, show that the response can be much higher, even up to 25 kg of grain per kg of NPK nutrient. Punjab on the whole has a higher fertiliser use efficiency than Uttar Pradesh:

With a higher intensity of cropping, soil health care becomes crucial to sustaining yield at a high level. Soil health care is a total concept involving not merely soil testing for nutrient status but also attention to the physical, microbiological and topographic aspects. Tillage practices will have to be tailored to soil and moisture characteristics. For example, in the United States, during periods of drought, farmers are advised to adopt as far as possible chemical tillage so that moisture is conserved. Punjab in particular will have to pay much greater attention to soil health care if production advance is to continue without detriment to the long-term production potential. Reclamation of alkaline and saline soils also needs urgent attention.

Different parts of our country are in different stages of agricultural evolution. We have, on the one hand, States like Arunachal Pradesh where shifting cultivation is still the primary method of soil fertility restoration. On the other hand, we have Punjab which now produces nearly one per cent of the world's foodgrain output and which can grow well whatever the crop the farmers find profitable — be it wheat or rice or potato or mushroom. Therefore, the precise agricultural strategy will have to be tailored to suit the socio-economic and agro-ecological features of each area. It is, however, clear that a "more of the same" approach may not take us far. Until now, our production strategies have invariably been spelt out only in quantitative terms such as the area to be covered under irrigation and high-yielding varieties, the quantities of fertiliser and pesticides to be applied, etc. A purely statistical and quantitative approach to overall programme design is no longer adequate. Extension approaches have so far been oriented to cater to the needs of individual farmers. The average size of an operational holding is, however, tending to become small and correspondingly there is an increase in the number of farming families. A small farm has good potential for intensive agriculture and is not a handicap from the point of view of adoption of high yield technology. On the other hand, a small farmer faces many problems arising from the cost, risk and return structure of farming. Agriculture happens to be the riskiest profession in the world. Therefore, only by understanding and solving the problems faced by small farmers can we realise the potential for high production of the small farm. Unfortunately this distinction often tends to get ignored. The qualitative and human aspects of agricultural programme design should hereafter receive greater attention.

I referred earlier to the crucial role of organisation and management as well as diversification from the point of view of elevating and stabilising production and enhancing income and employment. The organisational aspects of small farm cultivation require urgent attention. This is particularly needed in dry farming areas where effective watershed management will become possible only if the farmers living in a watershed work cooperatively in collecting and managing rain water. Similarly, plant protection and post-harvest technology can be much more effective through an area rather than an individual-farmer approach. Extension systems, therefore, should adopt a group as well as an individuals-farmers approach depending on the message or technique to be extended. Promotion of group effort will become easy only if all the members of the group find that they stand to benefit economically from joint endeavour. The demonstration of economic benefits flowing from group work in water harvesting and management, soil conservation, plant protection and post-harvest technology should be one of the important tasks of extension workers.

Data on the estimated population during the next 50 years are given in Table 11. The data show that not only will the population grow but the dependency ratio will become smaller. This indicates that to win the war against hunger, we will have not only to produce more food but also generate necessary purchasing power through greater opportunities for gainful employment.. This is where diversification of employment opportunities becomes important. In technology development, the aim should be the effective integration of emerging and frontier lines of technology with traditional skills and methods. For example, there are great opportunities for integrating developments in the field of micro-electronics, biotechnology, satellite imagery and communication and chemical engineering with the traditional methods of production and post-harvest technologies. In this manner, many traditional occumpations can be rejuvenated and made attractive and cost-competitive. Such an integrated approach will have the great merit of not displacing human labour with machines and not causing ecological harm. Since unemployment and under-employment are in many cases the major causes of under-nutrition in developing countries, technology development should be based on its potential impact on employment and particularly on the traditional occupations of rural women. Diversification of labour use and not displacement of labour should be the aim of technology development and transfer.

I shall illustrate this taking the rice plant as an example. Rice production in India was 53.2 million tonnes in 1980-81 after a drop in the previous year (1979-80: 42.2 million tonnes). The decline in production in that year was due to drought which adversely affected the rice crop in many States. The area, production and productivity for three consecutive previous years are given in the following table:

	1978-79	*1979-80*	*1980-81*
Area (million ha.)	40.5	39.0	39.8
Production (million tonnes)	53.9	42.2	53.2
Productivity (kg/ha.)	1328	1082	1338

Compared to 1978-79, the productivity increase was only marginal in 1980-81.

The zone-wise trend in area, production and productivity for the years 1979-80 and 1980 81, is as follows: The States in East Zone accounted for 35.6 per cent of total production in 1979-80 and 38.6 per cent in 1980-81. In terms of area, it had 42.8 and 45.1 per cent in the two years. Further, the Central Zone had the lowest productivity level in both years, followed by East Zone.

Rice statistics for 1980-81 are given in the following table:

The percentage irrigated area was the highest (80.5 per cent) for States in South Zone, followed by those in North Zone (77.2 per cent). It was low

	North Zone	*South Zone*	*East Zone*	*West Zone*	*Central Zone*
% of total rice area	5.1	19.2	45.1	5.5	25.1
% of total rice production	9.6	27.6	38.6	6.0	17.7
% of irrigated rice area	77.2	80.5	28.1	25.9	18.6
% of area under HYVs	90.8	80.7	27.2	65.2	39.7
Yield of rice (kg/ha.)	2517	1925	1145	1445	946
Area of rice (million ha.)	2.0	7.6	17.9	2.2	10.0
Production of rice (m.t.)	5.1	14.7	20.5	3.2	9.4

North Zone: Punjab, Haryana, Jammu & Kashmir and Himachal Pradesh.
South Zone: Andhra Pradesh, Karnataka, Kerala, Tamilnadu and Pondicherry.
East Zone: Bihar, West Bengal, Orissa (survey area), Assam, Manipur, Meghalaya, Nagaland, Tripura, Arunachal Pradesh.
West Zone: Maharashtra, Gujarat, Rajasthan and Goa, Daman and Diu.
Central Zone: Uttar Pradesh and Madhya Pradesh.

for States in Central (18.6), West (25.9) and East (28.1) Zones.

Interestingly, the high-yielding varieties coverage has a relation to area under irrigation. With the exception of Central Zone, the area coverage under HYVs was more in States with better irrigation facilities.

Despite the presence of zonal disparities, both in productivity and in production, scope exists for increased productivity and consequently production in all zones even with the available technical know-how.

It has been estimated by plant physiologists that the maximum yield potential of rice in the tropics may be as high as 15.9 tonnes per hectare for a single crop in the dry season and 9.5 tonnes per hectare in the wet season. At the International Rice Research Institute in the Philippines, a total yield of 25.6 tonnes per hectare was obtained in a four-crop-per-year experiment. Technologies of rice production for rain-fed areas as well as for waterlogged areas need greater perfection. Our rice scientists have produced some varieties like CR-1009 which do well in about 50 cm of standing water. The problem in such cases is the method of applying fertiliser. Urea briquettes or super granules are being tried. In rain-fed farming also, there are greater opportunities now for increasing yield. In areas where the yields are already high, the aim should be to safeguard the crop from the ravages of pests and from loss in soil fertility. For example, bacterial blight is showing signs of becoming important in Punjab. Varietal diversification as well as a more rapid replacement of varieties will be necessary. By undertaking an inter-disciplinary constraints analysis in each area, it will be possible to identify the precise constraints responsible for the gap between potential and actual yields. This should be one of the important tasks of the 'productivity year'. The next significant advance in rice production in the Punjab will come when our scientists are able to develop and release hybrid rice capable of yielding 20 per cent more than the best varieties available now. China has already large areas under hybrid rice, whose seeds will have to be supplied to farmers every year.

Rice straw is today mainly used as cattle-feed or is even burnt as in parts of Punjab. Modern post-harvest technology has made it possible to utilise rice straw as an excellent cattle-feed. Conservative projections indicate that demand for milk in India will increase to 30 40 m.mt. by 1984-85 and to 50 m.mt. by 1990. In comparison the production of crop residues will increase from 300.5 m.mt. to 330.2 m.mt., of green fodder from 691 m.mt. to 723.9 m.mt, and of concentrates from 20.5 m.mt. to 26.7 m.mt.

It is in this context that the straw and other agricultural by-producs assume greater importance. Straws, in general, form the main bulk of roughages for livestock. However, their intensive use is limited by the fact that they have high lignin, silica and oxalate contents. Besides, they have low mineral content and palatability and high dustiness. Nonetheless, these limitations can be overcome by appropriate treatment which will increase the total digestible nutrients content of straws from 35-40 per cent to 60-65 per cent. The estimated availability of straws and other dry roughages is shown in the following table:

Although exact figures are not available, it is estimated that with every ton of paddy produced, an equal amount of straw is also produced. This puts the quantity of production at 40 to 50 m.mt. every year. (This amounts to about one third of the total straw production). The high silica content (about 13 per cent) contributes more towards its low digestibility than the lignin content.

Nonetheless, there is high potentiality of using paddy straw as a staple food for livestock once it is properly treated. These treatments are directed towards increasing its palatability, digestibility and nutritive value mainly but breaking the ligno-cellulose bond and reducing the silica and oxalate

	1978-79	*1979-80*	*1980-81*	*1981-82*	*1982-83*	*1983-84*	*1984-85*
							(in million metric tonnes)
General straw	171.31	174.26	177.29	180.43	183.66	187.00	190.46
Other dry roughages	129.23	131.52	133.81	136.18	138.62	141.14	143.75

(*Source*: Report of the Committee on Livestock Feeds and Fodders, Ministry of Agriculture and Irrigation, New Delhi. NCA Report 1973, p 686) contents. Some of the treatments in use are:

(a) *Soaking in water:* Soaking straw in water in the ratio of 1:1 has been reported to improve the palatability and dry matter . consumption. The main effect was due to reduction in dust content—improving the intake. In case of paddy straw, soaking also removes some of the soluble oxalate: hence it nutritive value.

(b) *Alkali treatment*: When treated with solution containing 1.25 per cent caustic soda in water in the ratio of 1:1 and dried, the oxalic acid and the silica content in the paddy straw is reported to be reduced. In addition, saponification of ester linkage between lignin and hemi-cellulose, allow greater diffusion of cellulolytic enzymes through substate leading to improved rates of digestion and voluntary intake. Various studies have confirmed that addition of 3 3 per cent caustic soda improves its palatability and digestibility of crude fibre. However, factors like availability, cost and handling problems limit its application.

(c) *Ammonia treatment:* Ammonia treatment has been found to be equally good in improving intake and digestibility of paddy straw. This is mainly because of added nitrogen content in the straw. However, a closed vessel treatment is essential to obtain maximum efficiency. Plastic covers used are costly and therefore the process is not common.

(d) *Ensiling with urea-molasses mixture*: Ensiling straw with urea improves the intake, digestibility and nitrogen content. The level of urea ranges between 1 - 2 per cent. Along with it molasses (8 to 10 per cent), mineral mixture (1—2 per cent) and salt (1 per cent) are also used.

(e) *Rice bran/deoiled rice bran*: Annually about 26 lakh tonnes of rice bran is produced in the country. A good quality rice bran contains about 10 to 12 per cent crude protein, 13.5 per cent oil, and 12 per cent crude fibre. High level of fat is the major factor in its limited use in cattle feed formulation as it goes rancid during prolonged period of storage.

Deoiled rice bran is the residue left after the oil has been extracted from the rice bran and thereby improving its keeping quality. It usually contains 13 to 15 per cent crude protein, 8 to 14 per cent crude fibre and 4 to 8 per cent silica. Being cheaper and easily available, it has become indispensable for feed manufacturers. Besides, this has also been the main factor for it to replace wheat bran (used for human food) in cattle feed formulations.

The total production capacity of the 21 cattle feed plants erected under Operation Flood and the IDA Project will be 2,600 mt. per day by the end of 1982. Putting the requirement of deoiled rice bran at approximately 30 per cent level, it is estimated that its requirement for these cattle feed plants would be about 910 mt. per day or 3,32,150 mt. annually by that time. These cattle feed plants, if operated at full capacity, may therefore take care of only 16.5 per cent of the total deoiled rice bran produced in the country which is estimated to be about 20 lakh tonnes annually.

Rice bran Oil: If all the oil present in the rice bran is extracted, about 3.5 lakh tonnes of it can be produced annually in the country. As against this, only one lakh tonnes of oil is produced currently. Out of this production, about 5,000 tonnes is of edible grade. The rest is used in the soap industry.

The main factor responsible for low production of the edible grade is its property to go rancid during prolonged period of storing. This is because of the presence of free fatty acids in it. However, this can be overcome by putting up oil extraction plants of higher capacity (more than 15 tonnes per day), as also by stabilising the bran with the help of steam of flue gas heated stabilisers. It will be advisable to have oil extraction plants near rice milling plants which will cut down a lot of expenditure and ease the entire process.

Deoiled bran: Deoiled bran can be stored for a longer period. In the process of deoiling, only the oil is removed and the protein and other nutrients are not affected. Thus there is a possibility of using the deoiled cake as cattle and poultry feed. Suitable fortification procedures will have to be developed.

Paddy husk: So far paddy husk has generally been burnt. The husk is known to be a good source of silicon. There is now interest in extracting solar grade silicon from rice husk, since this constitutes an important material for the production of photovoltaic cells.

Thus today not only paddy production can be increased but also value added products can be obtained from every part of the plant.

Such an exercise can be done for all plants, since modern technology would help in making better use of the remaining parts of the plant other than the one normally used, such as grain This approach is also valid for animals where skin, bone and blood have all value and use.

Our comparative strength lies in agriculture, since we have good arable land, abundant sunshine, vast irrigation resources and above all a hard-working and highly receptive farming community. By adopting a systems approach, we can make agriculture and animal husbandry and agriculture and aquaculture mutually supportive..

The battle against unemployment can be won only by paying greater atention to land and water based occupations and to rural development. The vast untapped production potential of eastern India and the scope for improving income and employment through the scientific utilisation of every part of the plant deserve particular attention.

Faiz on Afro-Asian Literary Scene

The well-known Pakistani Weekly *Viewpoint* invited Faiz Ahmed Faiz to sum up the main features of the present literary situation, with particular reference to the most prominent trends in Afro-Asian literatures. Here is a transcription of Faiz's answers to some of the questions put to him.

Q. How do you view the present literary situation?

A. The literary situation today, like the present human social situation, is in some way very similar to the situation in the thirties. As you will recall, the euphoria brought about in the twenties by the end of the First World War ('the war to end all wars'), the breakdown of Victorian moral and social constraints, the hopes aroused among all oppressed peoples like us by the October Socialist Revolution and the rise of nationalist movements, the brief prosperity enjoyed by the mercantile citizenry through war profits and the rural masses by rising prices of their product, all combined to produce a general air of emotional abandonment, intellectual freedom, and creative gaiety. By and large, this was the era of romantic lyricism and art for art's sake.

This era was soon overtaken, however, by a double crisis in the thirties. The world economic depression hit the underprivileged classes in East and West alike, giving rise to a sharpened sense of 'class' consciousness and an intensification of class struggles in both Eastern and Western societies, supplemented by the ideological basis provided by socialist philosophies. The rise of Nazi fascism in the West and Japanese militarism in the East gave rise to sharpened antagonisms among the Western Powers to complicate the existing confrontation between the Socialist and capitalist systems, on the one hand, and the democratic and the authoritarian value systems, on the other. As in all period of social and political crises, this phenomenon was reflected in the world of literature by a great divide between two major schools of literary thought and expression, both creative and critical — of progressive realism' on the one hand, and 'subjective escapism' cloaked as aesthetic formalism, on the other. Thus, the great debate began on the role, function and evaluation of literature; between 'functionalists', on the one hand, who believed that the writer as an exponent and interpreter of social realities was 'an engineer of human souls,' and 'the aesthetes', on the other, who held that literature was no more than an artistic compendium of linguistic devices and the writer was no more than an engineer of words.

On the theoretical plane, this Cold War has been revived in contemporary literature once again by theories of structuralism, formalism, expressionism, etc., and by the incursion of linguistics, what V.S. Pritchett calls 'the ironmongery of words'. As an anti-thesis the post war years have produced a raw concept of the 'literature of commitment' and a more analytical approach to the theories of social and critical realism to relate the non-literary, ethical and social content — 'extrinsic' components of literature — with its intrinsic aesthetic standards.

Q. What about the anti-form movement?

A. The anti-form movement so called like some other forms of 'pop' art has two sides. On the one hand, it was, or is, a kind of protest against the norms and conventions of what the 'angry young men' considered to be a decadent and played-out literary and social Establishment, and, on the other, an attempt, like all anarchistic activity, to seek individual self-fulfilment by abjuring all social responsibility to your audience. However, to continue with the literary situation. The economic and political crisis of the thirties that I mentioned earlier had both global and local dimensions. On the global level, the world economic depression generated a radical movement in the form of the great body of the literature of 'social comment' in the West, and in our subcontinent the second most significant literary movement after the 19th century in our literatures — the Progressive Writers' Movement. The menace of fascism united the conscientious and politically-conscious writers of East and West into a great sweep of anti-fascist sentiment, particularly after this menace was made more manifest by the Spanish Civil War and the Japanese invasion of China. It also sent the timid of heart and the myopic of vision scurrying into the recesses of their own sub-conscious, the dream world of myth or legend, or the playground of linguistic and stylistic devices.

As I said, we are faced with a similar world situation today. On the global plane the escalation of the arms race, particularly the ever-ascending spiral of thermonuclear weapons manufacture initiated and led by the USA, coupled with the brink-manship of the new US establishment, has brought to the whole of mankind a wholly and qualitatively new menace of total annihilation. This is accompanied by all-pervasive efforts of the newly risen mafia of international monopolies to maintain their stranglehold on the resources of the Third World, and to reverse the process of history by perpetuating, or bolstering up, the backward social and political structures in those countries more amenable to such exploitation. On the national plane, the erstwhile euphoria of newly-won freedom has evaporated in many Asian and African countries by the replacement of foreign domination by domestic tyrannies and by the emergence of new class structures as, or more, exploitative than the one they displaced. The post-liberation literature in these countries again reflects conflicting moods of confronting reality or evading it, of protest and

~~KP 3821~~ . KP 3822

hope, or disillusionment and despair.

Q. What about the Afro-Asian writer's movement?

A. The disintegration of some Western imperialist empires in Asia and Africa after the Second World War, and the liberation of many Asian and African countries, lifted after many centuries the barriers of communication interposed between them by the imperialist Powers. Tentative groupings then began to go in search of each other again, and to restore some of their ancient cultural links severed by foreign domination. At the initiative of some Indian writers a conference of Asian writers of various schools of opinion was convened in Delhi in 1956; it decided to enlarge the circle of their confraternity by including their confreres from Africa, and thus, at the invitation of Soviet writers, the foundations of the Afro-Asian Writers' Association were laid in Tashkent in 1958. Its Secretariat was first established in Colombo in 1959, and later shifted to Cairo in 1963. Subsequently, the Association was enabled to congregate after every four or five years in a general conference in Cairo, Delhi, Beirut, Alma Ata, and more recently in Luanda in Angola. Thus, eminent writers, from both those continents, only some of whom were distantly acquainted with one another through meagre translations of Western publishers, got together for the first time to exchange views and to pool their experience in detailed discussion on the basic technical and ideological problems faced by the present-day writers in their respective countries. In 1968 the Association produced its quarterly journal, *Lotus* in English, French and Arabic, which is now in my charge.

Q. Could you enumerate some of these basic problems?

A. With few exceptions, the basic cultural problems in Asia and Africa stem from one primary source — the era of colonial domination — and demand one basic solution — the decolonisation of their cultures, including literature. Apart from this common feature, however, there is little uniformity of pattern, as the advent of imperialist-colonialist domination hit different levels of development. Among them were advanced feudal societies like ours, with developed languages and literatures of their own. There were, on the other hand, also pre-feudal, tribal or even pre-tribal societies, as in parts of Africa, whose ancient traditional cultures had already disintegrated through other historical factors and whose languages, and literatures, therefore, had not progressed beyond folklore and oral discourse. In the former case, the successors of the old feudal class, the new middle class, eagerly accepted Western norms and conventions of both literary creation and evaluation to veneer their urban classical heritage, on the one hand, and to alienate them from their folk tradition, on the other. In many African countries, however, their native languages were swamped altogether by the invading English, French, Spanish, or Portuguese, and gave to each country instead a hybrid patois of its own. When these countries were liberated, therefore, and they were the last to be liberated, the writer's reaction to this colonialist depredation was more fierce and his quest for his own native cultural and literary roots in his folk heritage was more impassioned than in ours. Even while writing in their acquired foster language they tried to rediscover the lilt, the idiom, and the nuances of perception and expression native to their folk traditions. To some extent this process is also under way in our part of the world, where the literary elite are trying to bridge their class and cultural alienation from their own masses by re-learning the idiom of folk literatures like Punjabi. In addition to this problem of rediscovering national, cultural and literary identity and relieving it of the debris of spurious overlays of colonialism, the modern writer is also faced with the task of adjusting these continuities of the past to the demands of present-day experience and social realities, as well as to the new advances in the techniques and stylistics of expression. In multi-lingual and poly-cultural societies like ours, there is the additional problem of finding a productive and acceptable relationship between the official or national linguistic medium, such as Urdu, with the regional languages which may ensure the progressive development of both. Then, there is the almost universal problem of raising the level of comprehension and appreciation of the culturally under-privileged masses without sabotaging the basic aesthetic values of literature. In short, a writer's work, like a woman's, is never done!

Q. Any suggestions for widening the dissemination of Afro-Asian literatures?

A. There is firstly the problem of translations which at present is the monopoly of certain Western publishing houses. It is time that this monopoly should be broken and taken over by private or State entrepreneurs; perhaps the idea of an Afro-Asian Literary Corporation or Consortium may be worth exploring. Secondly, it is time that our academic institutions concerned with literature should break free from the apron-strings of Western literatures and introduce into their syllabi the study of African and Asian literatures instead. Thirdly, more intensive facilities should be provided for cultural exchanges among writers of the two continents in addition to the platform provided by the Afro-Asian Writers' Association.

Q. Literature and propaganda?

A. In a sense, all literature is propaganda unless it totally fails to communicate, which it is no literature at all. Even nonsensical literature propagates nonsense. Literature fails to be literature and becomes journalese or pure propaganda only when it lacks the additional aesthetic dimension required of all literature.

Q. Finally, what values do you believe to be basic to all good literature?

A. Basically there is only one value — humanism. All other values, love of peace, freedom, social justice, compassion, alleviation of human suffering, self-realisation, adoration for goodness and beauty, flow from it.□

Krishna Sobti : The Turbulent Soul

K.S. DUGGAL

I have read and known several women writers but Krishna Sobti stands distinctly apart.

She is a woman writer who makes her readers, male or female, feel perfectly at ease; every word that she writes is an utterance from her heart and has the sparkle of unalloyed truth about it.

In one of her sketches, Krishna Sobti narrates an encounter with a woman in a party who takes her to be a singing girl and starts asking her all sorts of awkward questions. She enjoys it thoroughly. And perhaps more talking about it later to her readers.

At times she reminds me of Ismat Chughtai who once heard about the death of someone's husband and asked a friend wistfully, 'When will we become widows?'

Because they are women writers, when they attempt anything bold, Krishna Sobti and Ismat Chughtai are dubbed obscene, loud and lewd, indecent and vulgar. Ismat Chughtai has been dragged into court more than once. Her counterpart has somehow escaped it. Says Krishna Sobti, "Literature and law may not look eye to eye. Literature mirrors life, law limit it. Though literature too has its internal discipline."

Born on the banks of the River Chenab known as Jhanan in Punjabi folklore, she belongs to the region that produced romantic lovers like Heer of Ranjha, Sohni of Mahiwal and Saheban of Mirza. Says Krishna Sobti — "I was brought up on the banks of the Chenab. I played on its sands. I bathed and swam in its waters. The Chenab flows in my veins. The truth is the Chenab is its own peer".

An author of as many as half a dozen important works of fiction in Hindi, Krishna Sobti says that she writes because she is made to write. The character she has conceived, must find expression. There is an element of inevitability. An altogether fresh imagery. A language verging on poetry.

"The simplicity of language is the vitality of a language," says the authoress. Her works *Dar se Bichhdi* and *Yaron Ke Yar* are remarkable illustrations of spontaneity in writing. A North Indian writing in Hindi, she draws freely from Urdu and Punjabi aside from her proficiency in Hindi as acceptable to the Hindi protagonists. This freedom with the language and aesthetic use of her diction is found at its best in her latest work *Zindgi Nama*.

However, what has come to be known as the distinguishing feature of Krishna Sobti's writing is the boldness with which she presents the so-called seamy aspect of our life. At the same time, Krishna Sobti is highly conscious of her responsibility as an artist. Her interest is not only in condemnation and demolition, she is constructive in her approach and is prepared to accept the norms of healthy, purposeful, socially relevant creative activity.

A leading fiction writer in Hindi, Krishna Sobti has carved for herself an entirely new path. She is like no one else amongst the contemporaries. And she can claim to have demolished quite a few idols among her predecessors. She represents the spirit of her time; the turbulent soul of the fair sex, the bold women's lib, the formidable upsurge of the female.

Like a meteor Krishna Sobti flashed across the sides of Hindi writing with *Dar se Bichhdi*. Then followed the frightfully bold *Mitro Marjani* that has also been rendered into a play and staged with eminent success. Her *Mitro Marjani* shocks, gives severe jolts and yet endears herself to the reader: you would not like harm come to her. She appears to be vulgar, uncouth, outlandish and yet in the end Mitro is right and everyone else is wrong. At the worst she is uninhibited.

Krishna Sobti's readers had hardly recovered from the tremors that Mitro had created in the placid waters of the Hindi world when she gave another shock wave in *Yaron Ke Yar*. As if there were no looking back there-after, Krishna Sobti stormed her way through with *Surajmukhi Andhere Ke* and *Ham Hashmar*.

In Ratti of *Surajmukhi Andhere Ke*, Krishna Sobti is dealing with another layer of society, another set of characters. She has to delve deep into the recesses of Rati's mind. And this seems to have dictated an altogether different style of writing. She is deliberate and sophisticated. Her approach is essentially psycho-analytical.

A fiction writer with rare mastery over her craft, Krishna Sobti has uncanny perception of the distortions in the life around her. She rips open the smothered gutters and punctures the festering wounds with her clinical knife. She speaks out all that goes on in the remote recesses of Indian womanhood, as an unwanted child, a discriminated daughter, a suppressed wife with the status of only a footwear and a dismayed mother destined to suffer the indignities inflicted upon her by menfolk whether it is a father, a husband or a son. A bitterness of ages, she has poison in her tongue. She bites to kill. It is a mercy killing! The patient is beyond cure.

We have to start afresh, a new, vibrant society with healthy values. Maybe we have to go back and recall what we have lost and forgotten. This is what the authoress does in *Zindgi Nama*, an all-time masterpiece that won the Sahitya Akademi Award in 1980.

A refugee from Pakistan, Krishna Sobti has nostalgic memories of the undivided Punjab of Muslims and Hindus alike. The Punjab with Sikh farm-owners and Muslim tenants. The Punjab that waged many a battle, Hindus and Muslims

The author, an eminent writer, was formerly Adviser (Information), Planning Commission.

fighting shoulder to shoulder, warding off intruders from the sacred soil of their motherland. The Punjab of Guru Nanak who was hailed as "the Guru of the Hindus and the *Pir* of the Muslims". The Punjab with common folklore — superstitious practices, magic and divination, festivals and fairs. The Punjab of shared songs and stories, riddles and proverbs and the robust language of a carefree people that haunts the dreams of those hounded out of their hearths and homes. Like a living daughter Krishna Sobti bewails all this.

Zindgi Nama is a work of art, a thing of beauty. It is not a piece of fiction though it reads like a novel. It is not a memoir though it appears to be one. It is sheer poetry, a string of fond memories recollected in a mood of homesickness.

That language is only a handmaiden when handled by a writer of Krishna Sobti's eminence is evident from an entirely new diction that we have in *Zindgi Nama.* The fearless use of Punjabi idiom, the frequent resort to Punjabi mannerisms in dialogue, the copious employment of Punjabi vocabulary to create the desired effect are some of the devices that the writer has evolved to create a soulful picture of her beloved Punjab, of Hindus, Muslims and Sikhs. If creative writing can help promote communal understanding, *Zindgi Nama* does it admirably.

The present volume is only the first part of the story; Rajkamal the publishers promise another volume in which the authoress bids to re-create the times of the freedom struggle and the heroic role that the Punjab played in it.

Sahitya Akademi Awards have, of late, lost their original charm. They are no more considered coveted literary distinction. The reasons are many, the most disturbing being an element of rat-race that has entered this sacred territory. Recently, a leading national daily alleged that even Dr. Radhakrishnan was not immune from using his influence as Chairman of the Akademi in favour of an author whose language he was not conversant with. As if that set an example, the annual awards are now openly canvassed and sought with the help of pulls, political or otherwise.

However, it is heartening that, at times, the Akademi chances upon a work of literary excellence that merits distinction eminently. Such a decision when made lends lustre to the Award itself as a national institution. The Sahitya Akademi Award for Hindi voted in favour of Krishna Sobti's *Zindgi Nama* is indeed one such instance.

Krishna Sobti with her many-splendoured versatility and delicate sensitivity brings a breath of fresh air of freedom. ☐

Kampuchea's Foreign Policy

Kampuchea's Hun Sen (30), perhaps the world's youngest Foreign Minister (and also Vice-Premier), has explained the Heng Samrin Government's foreign policy in an interview to Asiaweek *magazine (March 5, 1982). The questions and answers are reproduced here.*

Q. Does the Heng Samrin regime have a truly Cambodian foreign policy, one that is more than a reflection of Hanoi's?

Hun Sen: Our policy is not subservient to that of Vietnam, but rather one of cooperation. Since the January 7 liberation (of 1979, when Vietnamese troops toppled Pol Pot), ours has been an independent foreign policy, though we have entered into a militant alliance with the brotherly nations of Vietnam and Laos....We seek friendship and peace with all nations.

What is the present state of your relations with Moscow?

After our country's liberation from Pol Pot, relations with the USSR improved. One cannot speak of the rebirth and progress of the Cambodian people without mentioning our privileged relations with the Soviet Union. Moscow has provided us with important aid, including food and development materials. I do not have all the figures, but I can say that in the years 1979 and 1980, we received some US $ 220 m. in Soviet assistance.

What about aid from Vietnam?

Vietnam is a poor country. It suffered enormous economic difficulties after the American war of aggression. Therefore, the help given to our people by Vietnam cannot be measured in words or figures. They gave their lives and blood for us, and the Vietnamese people made great sacrifices for the people of my country. (Despite its difficulties) in the years 1979 and 1980 we received more than $ 100 m. in aid from Vietnam. The Vietnamese also provided grain, rice and agricultural hardware.

How is the food-supply situation in Cambodia today?

Generally speaking the situation is stable. However, because of poor harvests last year caused by floods and drought, we may need some 400,000 tons of rice this year. We are worried because our aid from international relief organisations has diminished, and without their help we may not be able to meet our deficit.

The recent removal of Penn Sovan from his post as secretary-general of the Communist Party was seen in some quarters as indication of rivalry between the Hanoi and Moscow factions in Phnom Penh. Is there any truth in this reading?

Those are sepculations of the West. Penn Sovan was sick, and our policy has not changed since he left his job. These are only insinuations to create discord. Neither Moscow nor Hanoi has any interest in competing for influence in my country.

Estimates put the number of Vietnamese soldiers presently deployed in Cambodia at 200,000. Is that figure correct?

Perhaps not.

Will they ever leave?

The problem is this: Cambodia still needs the presence of Vietnamese troops. We would like to see them withdraw, as would Hanoi, but we simply cannot risk a repetition of what happened under Pol Pot. The threat against us is still there — a permanent threat from outside. Until these threats are removed, we would not like to see the withdrawal of Vietnamese troops. For example, if Thailand were to put an end to its cooperation with China, cut off aid to the reactionary Khmer forces along its border, and remove those forces from the border area, we would be prepared to start immediate negotiations with the Vietnamese for a partial withdrawal of their forces. Even now, we are prepared to meet with Bangkok to discuss the creation of a demilitarised zone along our common border and other matters conducive to the peace and security of our two countries.

What about your own army?

We are in the process of creating it. We are working on its quantity as well as its quality. We hope it will become operational within two or three years.

Parameters of Industrial Justice

V.R. KRISHNA IYER

A new industrial culture is building up with the Constitution as its corner-stone and the Court as its overseer. Gandhiji was the harbinger of this humane economic and legal order, where man — the toiler in tears — mattered. Nehru gave this legality a socialist bias. What is our terrible lot today? Nehru made the tryst with destiny to wipe every tear from every eye, at the midnight hour of August when India awoke to Freedom. And now, see what is the autobiography of Indian economic justice. I quote from Escott Reid (*Envoy to Nehru*) what I regard is a moderate economic statement, the truth being more traumatic than eye can see on the surface, heart conceive from five-star hotels and tongue can adequately tell without witnessing the blood toil, tears and sweat of the living skeletons. Right now, in 1981-1982, hardships weigh down hundreds of thousands of our children. It was worse before. I am shocked and shamed that in our motherland I plead with the professional patriots of all labels: do something to save these miserables, amidst your political ballyhoo.

National reconstruction is humane politics. Abolition of utter hunger and giving homes for human flotsams and jetsams is social justice. Have you seen babies lying in the mud and children crying after the trailing torn sari of the phantom mother slaving on stone-quarrying for a lawless construction contractor in Delhi, the capital city, or Calcutta, the Marxist metropolis with no Government, no labour officer, no working class noisemaker to shed a tear or care to call law to order?

We must change this social order shot with injustice, change this religion of material pleasure and worldly success devoid of ethics and morality.

Gandhiji, whom most politicians on auspicious occasions flatter as the Father of the Nation, said a few things on Industrial Justice. He has gone on record: "I want you to make your labourers co-partners of your wealth." "We have unfortunately come under the hypnotic suggestion and the hypnotic influence of capital, so that we have come to believe that capital is all in all on this earth. But a moment's thought would show that labour has at its disposal capital which the capitalist will never possess. It is wrong to think that a piece of metal constitutes capital; if we go to the very source, it is labour that is capital, and that living capital is inexhaustible ..." Gandhiji's economic ideology he spelt out in *Young India* way back in 1928: "According to me, the economic constitution of India, and for the matter of that, of the world, should be such that no one under it should suffer from want of food and clothing. In other words, everybody should be able to get sufficient work to enable him to make the two ends meet. And, this ideal can be universally realised only if the means of production of elementary necessaries of life remain under the control of the masses. These should be freely available to all as God's air and water, are, or ought to be; they should not be made a vehicle of traffic for the exploitation of others. Their monopolisation by any country, nation or group of persons would be unjust. The neglect of this simple principle is the cause of the destitution that we witness today, not only in this unhappy land, but other parts of the world, too."

This contribution is from Justice Krishna Iyer's acceptance speech when receiving the Sir Jehangir Ghandy Medal for Industrial Peace at the Xavier Labour Relations Institute, Jamshedpur, on February 20, 1982.

It is ironic that Article, 48 (A) notwithstanding, God's air and water are rare because the big industrial plants want more profits at less cost, be the social cost what it may. If Big Industry bullies and Law's limbs hang limp, what hope has Labour from the Law? That takes us to Nehru's thesis at the Lucknow Congress: "I am convinced that the only key to the solution of the world's problems and of India's problems lies in Socialism, and when I use this word I do so not in a vague humanitarian way but in the scientific economic sense. Socialism is, however, something even more than economic doctrine: it is a philosophy of life and as such also it appeals to me. I see no way of ending the poverty, the vast unemployment, the degradation and the subjection of the Indian people except through Socialism."

Today, the Republic is constitutionally socialist. From here, we may glimpse the concept of social justice as articulated in the Articles of our legal Bible, the Constitution, which binds judge and lawyer, Government and Opposition, management and worker. Our country being a Socialist Republic, pledges social and economic justice (Preamble plus Article 38) and makes certain principles fundamental in the governance of the nation (Article 37). Kindly read with me Article 38 (2): "The State shall, in particular, strive to minimise the inequalities in status, facilities and opportunities not only amongst individuals but also amongst groups of people risiding in different areas or engaged in different vocations." Article 39, which has overriding effect as a mandate to the State, but has equal force to the private sector if activist judges oblige the State, by appropriate interpretation, not to extend State licences and other facilities unless Part IV be obeyed by it in action. When I say "activist judges," judicial eyebrows will be raised, I know. But the inevitability of history will force the pace. Articles 39, 39A, 41, 43 are a welfare code for workers, even as Article 43A postulates partnership. Article 43A says: "The State shall take steps, by suitable legislation or in any other way, to secure the participation of of workers in the management of undertakings, establishments or other organisations engaged in any industry." I read that provision only to show that, though it is in the Constitution, it is dismissed as a paper tiger and is more honoured in the breach than in the observance by the public, the joint and the private sectors, and ironically, by by the state itself on its legislative and executive sides. Lifeless Law is national deception.

INDUSTRIAL Jurisprudence must produce a comprehensive and effective code of industrial relations and regulations expressing the social philosophy of the Constitution which, I may point out, is non-aligned. It helps the weak but is pragmatic. A wider social vision shows that, conceptually speaking, "Industry" is where goods and services to satisfy human needs are produced by concerted action, by fruitful partnership. All the sectors of industry must realise this to be the new perspective of a nation in distress. Industrial peace is not the silence of the cemetery forced by law, but the song of joy where life has some stakes still. Industrial jurisprudence — the orderly progress through industrial justice — is the practical application of the basic structure of social justice to common welfare in the field of production. Judges are engineers of this process and artists of many chemicals and colours mixed in just proportion, the goal being that the industry will survive and those who sweat too will survive. To jettison the worker to keep profits up is unjust economics. But workers who kill the goose that lays the golden egg are abettors of national injury. A sense of belonging is the key to success on both sides.

Industrial justice and peace demands of judges a compound of legal learning, human equations and consciousness of national necessities. Justice Felix Frankfurter, the great American on the Supreme Court, put it in lovely diction: "A judge should be compounded of the faculties that are demanded of the historian and the philosopher and the prophet. The last demand upon him — to make some forecast of the consequences of his action — is perhaps the heaviest. To pierce the curtain of the future, to give shape and visage to mysteries still in the womb of time, is the gift of imagination. It requires poetic sensibilities with which judges are rarely endowed and which their education does not normally develop. These judges must have something of the creative artist in them; they must have antennae registering feeling and judgment beyond logical, let alone quantitative, proof." Chief Justice Earl Warren spoke what judges here must hear: "Our judges are not monks or scientists, but participants in the living stream of our national life, steering the law between the dangers of rigidity on the one hand and of formlessness on the other. Our system faces no theoretical dilemma but a single continuous problem; how to apply ever-changing principles of freedom."

I have talked to you about Gandhian perspectives and constitutional value-leanings. I have quoted to you what great judges regard as judicial know-how. But India, today, must surmount its current crisis, especially in the developmental-distributive field, by adoption of pragmatic humanism and production patriotism by the triple partners of the process. The State's Industrial Policy leaves much to be desired, not in an elocution competition enunciation and hortation, but in the commitment to principles of *economics where man matters* and "each according to his needs" has play. The State, it is a pity, has let down the Constitution for reasons best left to surmise.

It is equally a pity that the public sector is run on the life-style of the private managements, with politicisation and primitivisation making it worse.

Labour disputes, even in the public sector, are faced unimaginatively with focus on fight, not right, on force, not fair settlement. Long litigation over disputes is expensive and embitters. Yet, we have few model employers who will talk to labour and settle on a give-and-take basis at a stage when more give and less take may still be humane and a gain. It is equally a tragedy that Labour is often geared to battle, competitive over-kill, splittism and politicisation under adventurist leadership. The vast unorganised sector, mostly rural or migrant construction workers, is the most tortured. The organised sector itself has many strata and is self-divided through plural politicised unions. Unity, which is strength, and constructive partnership, which is the role of labour to make it the production backbone of the nation, are still a consummation devoutly to be wished. Goondas and policemen come into operation when strikes start and conciliation processes become fruitless rituals. Desperate workers turn noisy, vituperative and violent, because managements exploit politics, remain heartless and fail to regard the worker as partner. How transformed will the industrial cosmos be if both wings have enlightened entitlement to the prosperity and adversity of the Industry? Man matters and more production becomes relevant if the worker gets distributive justice *pari pasu*, the cards are played openly and the cake shared justly.

Harmony, in industry as in other national affairs, is music from the heart, not forced notes with the whiphand. The labour union, once faith is created and goodwill smiles on both sides, will take care of the quality and quantity of production because they have stakes in the size of the cake. This development-cum-distribution orientation alone will orchestrate industrial relations, not kilkenny cat fights of futility. Too many families are hungry and the nation must feed them. We have brains and brawn, but make headway backwards. Destructive politics — a tool in the hands of the capitalists and, at times, a temptation with unions — pollutes the air. No one believes the voice of the partisan Executive. And Judges, too, have covert prejudices and latent politics. A new wave of nationalism in production and humanism in consumption must be the note to be struck, the rhythm to be pulsed, if industrial harmony — that urgent desideratum — were to prevail. We are a socialist Republic and social justice is the national signature tune. We are hungry and poor and need all the resources even to survive. Within these parameters our norms of profit and wages and management partnerships must be worked out. This is the law of life and life of the law. This is social justice in its relativity and industrial justice *where man matters*. I stress this human side because among the billion "absolute poor" of the earth over 250 million are warehoused in India as flotsams, jetsams and dire-destitutes — men, women and children — the like of which elsewhere in the world no eye has seen, no heart conceived and no human tongue can adequately tell. In Tagore's words, they are "the eternal tenants in an extortionate world." Industrial equity, justice and good conscience must be read in this context

The ugly reality is that we have unsocial socialists and anti-socialist politicians. We have planners whose stock is too low. We have "feudal" capitalists devoid of even professional skills and clinging to familial lines of fossil management, with graduation in opportunist politics and corrupt tactics. We have workers who have no ideological nor trade union training and, on occasions, play capitalism from the other end or think that extremism in sound and fury is good policy. A progressive discipline, a fresh dialogue, a programme of realism-nationalism-humanism must be forged with focus on more production, more equity in the share of profits, more respect for each other, more social concern — in short, more patriotism in industry. It is no longer a private sector. All industry is in the People's Sector.☐

Budget Inflation and Plan

M.J.K. THAVARAJ

***Mainstream* has published three articles on the Central Budget by Prof. S K. Goyal (March 6, 1982), Girish Mishra and Prof B.B. Bhattacharya (March 14, 1982). We publish here the views of another expert on the Budget.**

BUDGET or budgetary policy cannot be seen in isolation. First, budgets at all levels of government are to be seen together. Secondly, fiscal policies are better revealed by budgetary trends over a number of years than by a single year in view. Thirdly, fiscal policy is to be seen in alignment with other economic policies and regulatory measures to gather a clearer picture of its impact on prices, development, income distribution and so on. Thus, stability will be affected by fiscal, monetary and pricing policies as well as by conditions of supply and demand and operations of the parallel economy. Fiscal policy will have larger impact on development, directly on the public sector plans and indirectly over the rest of the economy. Balance of payments will be influenced by international economic environment, trade policies and other external transactions of the Government. We are, however, concerned more about the Central Budget for 1982-83.

In contrast to 1979-80, economic indicators have been cheerful in the last two years. Thanks to good monsoon there have been two consecutive years of record harvest. Industrial production has also been looking up. Man-days lost due to strikes and lock-outs have declined. Consequently, the increase in national income has kept up with the average envisaged for the Sixth Plan period. Foreign exchange reserves have been drawn down by nearly Rs. 1,300 crores during the current year. A part of the IMF loan has been utilised. Edible oils and even foodgrains were imported. All these are expected to bring down the price level. But nothing like that has happened. All that the Government claims is a deceleration in the rate of inflation. Its claim is based on the fact that the rate of increase in the index of wholesale prices has slowed down. While wholesale prices in 1980-81 had recorded an increase of more than 18 per cent over 1979-80, the increase up to January 9, 1982, has been less than 9 per cent.

This, however, is no consolation. First, prices have continued to increase in spite of record crop, higher industrial production, and withdrawals from foreign exchange reserves. Secondly, consumer prices have recorded higher rates of increase from year to year. While the rate of increase was only 8.76 per cent in 1979-80 (a year of all-round deterioration in economic performance), the rate of increase has been 11.39 per cent in 1980-81 and 13.2 per cent up to August 1981. This implies that while national income increased, the real income of the majority of the working people and salaried employees is being seriously eroded. The general impression created is that the escalation in consumer prices is due to increase in prices of crude oil and petroleum products. In fact, oil is only a minor villain of the piece. It is increases in the price of primary products like cereals, pulses, edible oils, fuel, etc., which account for the bulk of the increase in consumer prices. Since primary products dominate consumer expenditure of poor and middle income groups, it is they who have borne the brunt of the inflationary trend in recent years.

What is more intriguing is the yawning gap between wholesale and retail prices. This has happened despite the relatively small increase in money supply in the current year. The upward spiralling of consumer prices could therefore imply (a) a step-up in the activities of traders and speculators with the help of black money; and (b) elongation of the chain of marketing and distribution as well as an increase in the margins gained by these intermediaries. Price rise could also be attributed to the inflationary effects of mobilisation and disbursement through the budgetary operations with which we are

Dr Thavaraj is Professor of Financial Administration, Indian Institute of Public Administration, New Delhi.

immediately concerned. In fact, taxation, escalation of administered prices, freight rates, tariffs, etc., of the public undertakings as well as large doses of deficit financing have contributed substantially to rising consumer prices.

The Jha Committee has established that about 80 per cent of the tax revenue in the country is raised by way of indirect taxes. They had also maintained that nearly 60 per cent of indirect taxes are drawn from relatively poorer sections of the population. Despite the glaring inequity of indirect taxation, Union Finance Ministers have continued to rely heavily on indirect taxation while at the same time extending considerable relief in direct taxes under the pretext of promoting savings and stimulating investment and exports. In fact, direct taxes were sought to be reduced during the two years 1981-83. Any increase noticeable in the revised figures for 1981-82 is either due to increased buoyancy or due to large profits reaped by the corporate sector. For instance, the profits of Oil India Corporation increased enormously on account of the drastic increase in the price of domestic crude.

There are a few distinctive trends evident in the pattern of resource mobilisation in the last two years. First is the exclusive reliance on indirect taxation. Secondly, greater emphasis has been placed on customs duties than on excise levies. Thirdly, railways have hiked their freight rates and passenger fares to unprecedented levels. Fourthly, administered prices of several investment goods and infrastructural facilities have been sharply increased.

The Budget for 1981-82 sought to raise about Rs 320 crores by way of indirect taxation, of which customs revenues were to account for Rs 290 crores. But the revised figures are higher by more than Rs 700 crores, of which nearly Rs 400 crores is attributed to increases in excise revenues. That is to say, 1981-82 witnessed taxation to the extent of about Rs 1,400 crores of which customs accounted for about Rs 600 crores and excise for about Rs 430 crores. To this we must add over Rs 350 crores mobilised by the railways and Rs 1,300 crores mopped up by way of hiking up administered prices of steel, coal, oil, aluminium, etc. In his Memorandum to the IMF the then Finance Minister had acknowledged that "the additional burden borne by the consumer because of these adjustments amounts to over 3 per cent of the GNP" (Para 13 of the Memorandum). Since the cumulative effect of prices of investment and intermediate goods, raw materials, freight rates, power tariff, etc., on consumer prices is a multiple of the amount directly raised by the Government, one could very well imagine how inflationary the pattern of resource mobilisation by the Central Government has been.

The mobilisation envisaged in the Budget Estimates for 1982-83 is no less than in the previous year. The mobilisation effort for the year had begun well before the Budget season. The previous Railway Minister raised Rs 320 crores by way of enhancement of freight supplementary charges with effect from January 1, 1982. The Railway Budget for 1982-83 has proposed to raise Rs 257 crores largely by revising passenger fares. Similarly, the Communications Minister raised Rs 100 crores by revising the tariff rates for telephones. The Budget has proposed to raise Rs 35 crores by an upward revision of postal rates. Thus, both the Railway and Communications Ministers have sought to raise more resources by resorting to extra-budgetary methods which are beyond the pale of Parliamentary voting procedures.

The General Budget has proposed to raise about Rs 590 crores almost exclusively by way of indirect taxation during a ful year. Over Rs 390 crores of this is expected to be collected by way of five per cent increase in the auxiliary duties on imports as in the current year. Excise levies are to yield about Rs 196 crores. However, it should be borne in mind that, in the current year, the revised estimate for customs and excise revenues is more than three times what was envisaged in the Budget. There is no guarantee that such gross underestimation will not be repeated. Exen if we ignore the element of deliberate underestimation of revenues, the total mobilisation since January 1, 1982 would exceed Rs 1,300 crores for a full year. It is not unreasonable to expect another round of increase of administered prices and charges of several public enterprises and infrastructural facilities. Dual pricing of cement is only the beginning of a chain of events to come. In the vicious circle of price-cost spiral which has entwined the public sector, a periodic revision of prices has become inevitable. Otherwise, increased losses in public undertakings would partially offset increase in tax revenues. Last year increases in administered prices preceded the Budget. In the ensuing year such increases may be expected to follow. Even if we ignore what is to come, mobilisation by way of customs, excise, freight rates and so on will have a cumulative effect on consumer prices. This can happen even if crop conditions continue to improve.

Since the Second Plan, the focus of fiscal policy has been on redistribution of income from the masses of consumers to the so called savers and investors who were supposed to usher in an era of accelerated growth and rising standard of living. What has really happened is a nominal increase in per capita income accompanied by an aggravation of poverty and inequality. While the gains of development have been garnered by owners of large property and multinational corporations, every crisis arising from drought, economic recession, industrial sickness and adverse balance of payments has led to an increase in burdens imposed on the large mass of consumers on the one hand and larger concessions and incentives for the very rich on the other. As seen earlier, the inflationary content of the Budget for the ensuing year will further impoverish the already immiserised poor. The so-called small savers may look at the enhanced limits of standard deduction, concessions on equity contributions, dividend interest income, etc, with some satisfaction. But they should be aware that even the so-called instruments of small savings yield much larger returns to the higher income groups. For instance, while the Capital Investment Bond is expected to yield a tax-free income of 7 per cent on the subscription, the effective rate of return on incomes above rupees one lakh may be as much as 22 per cent. Besides, up to a limit of Rs 10 lakhs, the subscription and the return would be exempt from income, wealth and gift taxes. Such is the nature of the innocuous-looking novel instrument! Social Security Certificate which tripples in 10 years is another such novelty.

As the Union Finance Minister has put it, the motto of the Budget is "save invest produce and get concession to export." Apart from concessions to savers and investors mentioned earlier, 30 per cent depreciation allowance for energy saving devices and systems or for minimising environmental pollution, tax exemption of luxury hotels on their gross receipts, exemption of plantations from wealth tax, continuance of investment allowance for another five years, increased deductions on capital gains, 100 per cent deduction in respect of donations to rural development programmes, for conservation of national resources, National Children's Fund, etc, concessional treatment of dividend income earned from companies manufacturing basic drugs, synthetic rubber and rubber chemicals, and concessions to savings and investments made by Indians staying abroad and so on, are some of the new features of direct taxation. Production is sought to be stimulated by way of excise duty concessions extended to 38 items embracing basic raw materials and other important industrial inputs and certain finished products. These concessions are made available if production of these items is in excess of 10 per cent over a period of twelve months beginning from March 1, 1982. It is not clear whether any distinction is made between increase in production out of already-established capacity and from newly-created capacity.

Similar confusion prevails in respect of income-tax reduction on export profit for exports whose turnover in the coming year will be in excess of 11 per cent of turnover in the current year. Tax relief of 25 per cent is also given to construction contractors operating abroad. Allowing the industries established in the Free Trade Zone to market 25 per cent of their output in the domestic market may have far-reaching consequences. This may amount to opening the flood-gates in terms of import liberalisation. Secondly, it may be difficult to resist similar concessions to 100 per cent export-oriented units outside the FTZ. Many of them have been established in collaboration with multinational corporations. They may come into clash with the interests of Indian producers. Cash subsidies on exports have also been increased while those on food are being curbed.

The Sixth Plan assumed price stability. Accordingly, the Draft Plan regarded Rs 3,500 crores as the safe limit for deficit financing. However, the Final Draft raised the limit to Rs 5,000 crores. But the deficit incurred during 1980-82 amounts to around Rs 3,675 crores. With the deficit shown in the 1982-83 Budget, the overall deficit financing during the first three years of the Sixth Plan would exceed the five-year limit by Rs 40 crores. Two more years are to follow. One can have genuine doubts as to whether deficit financing could be confined to the budgeted limit. Already, four instalment of DA due to Central Government employees have been officially announced. More may follow if the cost of living continues to rise. The constraints on state finances could compel them to resort to more overdrafts which have amounted Rs 1215 crores in the current year up to the end of February. A part of this will have to be accommodated within Central finances.

Can we be sure about the quantum of escalation in Defence expenditure? In the current year Defence expenditure increased by about Rs. 900 crores over the previous year. But what is provided for in the present Budget is only about Rs. 500 crores over the revised estimate for 1981-82. Is this realistic? What about other non development items like outlays on law and order machinery? Will the buoyancy in revenues be large enough to meet such unanticipated escalations? If found inadequate, the actual deficit financing will be far in excess of what is envisaged in the Budget. This is bound to stoke the inflationary fire.

The Sixth Plan envisaged an outlay of Rs. 97,500 crores, of which Rs. 48,600 crores is to be in the state sector. These outlays were reckoned in terms of 1979 80 prices. With the present Budget, the total outlay on the Plan for three years amounts to over Rs. 53,000 crores which is about 53 per cent of the amount envisaged for five years. Of this, about Rs. 27,500 crores will be in the Central sector and Rs. 26,000 crores in the States sector which account for about 56 and 54 per cent of the outlays envisaged under the Plan.

As figures stand, the overall outlay for the five-year period may be fulfilled in financial terms (that is, at current prices). But as the Planning Minister has acknowledged, there has been a 20-30 per cent cost escalation in public investment during the two years (1980-82). With the present trend of exclusive reliance on indirect taxes, inflationary financing and enhancement of administered prices of investment goods and economic overhead facilities, the upward pressure on costs of construction will continue. By a modest reckoning, if the costs of construction go up at the same rate as they have done so far, in real terms the Sixth Plan outlay may not be more than half of what was envisaged.

One consequence of cost escalations in public investment is that funds get diverted to the core sector. In the current year, in the Central sector, 56.5 per cent of the Plan outlay was earmarked for oil exploration, coal, power, transport and communication, steel and minerals. In the new Budget, the same sectors have claimed the lion's share. For instance, the outlay in petro-chemicals would be increased by 90 per cent in the coming year. Coal-power would account for an increase of over 60 per cent. The energy sector is accorded top priority. More than a third of the Central outlay would be absorbed by this sector. Thus, the core of the Plan is getting narrower. Inevitably, other sectors are being starved of funds. For instance, in the current year, social and Community Services accounted for less than what was envisaged in the Budget. The capital outlay on this sector envisaged in the Budget is less than what was envisaged last year. It is because of this that the emphasis in many sectors has shifted from the Plan to the new Twenty-point Programme. On close examination, one would find that the amounts involved in these programmes are relatively small. Even then, barring a few programmes like Minor Irrigation, Family Welfare, IRDP, NREP, Hill Areas, etc., the increases in most others are marginal. This has become inevitable in view of the shifting priorites.

One of the glaring manifestations of the brewing crisis in Plan implementation is the sharp decline in the relative emphasis accorded to the State Plans. The last Budget proposed to increase the State Plans outlay by 22 per cent though the overall increase in the size of the annual Plan outlay was only 20 per cent. In other words, the step-up the State Plans outlay was larger than that of the Centre according to the Budget Estimates for 1981-82. But, many States had to prune the outlay in view of constraints on resource mobilisation.

Central assistance was pegged to about Rs. 14,300 crores for the five-year period irrespective of increases in prices and costs. Since the buoyancy of State revenues does not keep pace with escalations in costs, States' own resources fall short of their Plan requirements. They do not also have access to a larger share of market borrowing. They were not entitled to the proceeds from Bearer Bonds and other instruments like Capital Investment Bonds. Consequently, many of them have run into heavy overdrafts. Hence, their Plan outlay tends to fall below the target not only in real terms but also in money terms. For instance, in the new Budget, while the overall Plan outlay is slated to go up by 21 per cent, that of the States will increase only by 14.4 per cent as compared to 27.7 per cent in the Central sector. It is indeed a very sharp decline considering the fact that in the last Budget the percentage increase was relatively higher (22 per cent) in the State Plan outlay. Some of the States like Kerala face the danger of no increase in Plan outlay from year to year. In the case of Kerala, annual Plan outlay has only increased nominally from Rs 273 crores in 1980-81 to Rs 275 crores in the two successive years. Out of the Sixth Plan outlay of Rs 1550 crores, the amount approved in the first three years is only about Rs 820 crores. It seems unlikely that the balance of Rs 730 crores could be utilised in the remaining two years. The same could happen to many other poorer states severely constrained in resource mobilisation.

This is the fate of Plan outlay in the States at current prices. Many of the States have given high priority to outlays on power development, major irrigation and transport and communication. The Centre has also accorded higher priority to these sectors. But, as seen earlier, cost escalations have affected the construction sector more severely. Showing down major construction projects would cost more in the longrun while at the same time delaying the benefits. This has necessitated the diversion of resources from socially-oriented programmes and activities to a few capital-intensive infrastructural facilities, some of which may not be so important from the point of view of the development of the economy of the State. The net result is neglect of programmes designed for the welfare of the weaker sections to which the new Twenty point Programme pays loud homage.

The increase in industrial production in the last two years is largely attributed to the utilisation of excess capacity found at the begining of the Sixth Plan. It is also maintained that excess capacity in the industrial sector is rapidly getting exhausted. If this is true, further growth of output will depend on good monsoon in the remaining three years and further expansion of productive capacities. The moot question is whether capacity creation consistent with the growth rates assumed in the Plan is feasible when the real worth of investments in the economy is drastically reduced by escalations in costs of construction. Will the projected stream of outputs flow from a truncated investment plan?

Thus, there are several features of the budget, which seen along with the relevant aspects of industrial and trade policies, would be highly pleasing to the IMF. Exclusive reliance on indirect taxation, inducements to savings, concessions to investment, relief to export, liberalisation of imports, steep increases in administered prices of public undertakings, curb on food subsidies, are all in conformity with IMF conditionality. Of course, all these elements were present in the Memorandum submitted by the Union Finance Minister to the IMF: One can argue that these are self-imposed disciplinary measures. They can also be construed as tunes played without the paymaster having to call them, since the piper is quite willing to oblige.☐

MARKS VERSUS LENIN?

They probably won't believe it when it comes chattering over the financial wire in the Kremlin, but Carl Marks is suing the Soviet government. He didn't like the outcome of the Revolution and wants a refund of $ 619 million and 65 years interest — preferably in gold.

Mr Marks is more capitalist than his name might suggest. He runs a New York securities and investment firm, and has filed an action in the Federal Court there to recover money sunk into two 1916 Tsarist bond issues. The underwriting syndicate included, among others, J.P. Morgan.

At the time, a five-year bond paying 5½ per cent in gold was pretty good buy. Vladimir Ilyich Ulanov, after all, was an obscure agitator holed up in Switzerland. Who was to guess that, for the price of a third-class Zurich-to-Petrograd railway ticket, he would wreck the Russian bond market?

Nor, apparently, the 3,000 innocents Mr Marks now represents. The last time anyone traded their 1,000 dollar bonds they peaked at their post-war high of two cents. Showing themselves thoroughly sore losers, the owners have now taken advantage of a law passed in 1976 allowing American citizens to sue a foreign government.

If they win their case, each bond will be worth not its original $ 1,000 but some $ 34,250 in accumulated interest—a rough total of $ 21,819,750,000 or 284 tons of gold. All they then need to do is to enforce the judgment against the heirs and assigns of the I. Ulanov (sometimes known as Lenin).

Basis for Rural Development

E. HABIBULLAH, Major-General (Retd)

FROM February 24 to 27 a most interesting seminar was held in Jaipur which was sponsored by the North India branch of the United States International Communication Agency. The most notable feature of the report is the high-sounding, and even philosophic, theorising of most of our countrymen who participated, as opposed to the down-to-earth, trial-and-error analysis by the American participants, together with practical analyses done by them which could apply to India.

Dr R.K. Arora in his summing up put it correctly that the "rural development effort in the US is concerned with improving the capability of rural individuals." Also, in summarising the eight points of the American approach, he concludes with point 8. "The rural development programme is built on local initiative, though it does not depend only on local resources and leadership."

However, the social conditions prevailing in India and the economic inter-relationship in the village must be the guide. The setting up of small farms and making the small farmer more opulent is not the vital point for India as is the case with small farms facing the very large farmer who holds sway in the USA. What is vital for us here is to understand that the composition of Indian village society is traditional even today. This has its advantages and disadvantages. The main disadvantage is the acceptance of superstition and shibboleths as the governing features of life and extreme suspicion of anything resembling change. Though it was expected that the removal of zamindars, whom such a situation suited most, would release a desire to change rapidly, this has not happened. A new set of power-holders have come into the vacuum created. They are a small kind of bourgeoisie, who lend money, sell liquor or have shops, and flour or rice mills. These power-holders are gradually taking the place of the zamidars by owning tractors, employing the village artisans, and continuing to lend money. They are also sought after to give decisions in cases of differences or to browbeat the poorer sections.

This new power class seeks to keep itself in position by supporting the politicians in power. Through their favour they derive more power for themselves and pick up permits, agencies and official contracts. These are largely the elements who in fact control agriculture also, taking on *batai* (share-cropping) the lands of the very small land holders, who in turn sell their own labour or migrate to towns to add to their small incomes from land holding.

Each village has its ancient layout and still retains its ancient panchayat system to some extent, that is to say, communities live in communal areas, have their own community panchayat, well, occupations, etc. This suits the new power-holders and the new politician. It has distorted the village panchayat, in that the panchayat is not voted by individuals but by communities. The classic panchayat of the elders has gone for ever. In my village the "Julaha" and the "Teli" are the largest communities. Several communities make a pact to outvote the others. The local political boss supports the most powerful. This leaves the others frustrated, and ready to seek alliances that will help weaken the powerful combinations.

In this social and economic environment, it is not possible, or it is almost impossible, to seek initiatives, while power and the money have passed into the hands of a well defined dominant class, controlled by politicans.

On the other hand, the block and district levels are dominated by bureaucrats who are "Government servants" and not "public servants." Therefore the entire policy and decision-making, the needs of the community as such, and the locality (the target area) are at their mercy. That is why most of the Indian speakers at the seminar talked of integrated planning and levels of operation; but, as one of them said, there is total confusion as between operation and administration. Those responsible for showing what must be done must be village people themselves.

The primary input to enable them to choose properly, is education. While the majority of village children do not go to school, adult education is simply non-existant. Therefore, without guidance and consultation to locate the needs of the entire village community, the actual needs of each village become very difficult to define. The second most important factor is health. This again requires education of a different sort; but a health worker to serve not more than 1,000 of the population is essential. The best way to provide one, is to train a person from the village and at the same time provide basic health instruction in schools and combine such instruction with adult literacy.

Thirdly a minimum diet must be guaranteed and provided. Basically, *roti* and *dal* is the diet to be guaranteed; but a surfeit of either to the privileged classes will have to be disallowed till a surplus is produced. This can only be done by observing Article 47 of the Constitution, (duty of state to raise level of nutrition and standard of living and, to improve public health), and setting aside enough funds for the purpose.

Ultimately roads, electricity, transport and drinking water supply have to be the infrastructure of rural life before we can even begin to improve life, leave alone change the life-style of villagers. It is for this reason that the Sixth Plan is likely to go the same way as the Third, Fourth and Fifth.

In the U.S.A large farms have driven people to the cities. In India the sharpening of struggle and the growing disparity in the rural areas are driving the weak to the cities, leaving the field to those who can muster force. □

Discussion *(from p. 9)*

The major contradiction in this situation, however comes from a different relation. If the Government policy becomes neutral, in the sense that it does not prevent the natural growth of the system, but only supports its inherent tendencies, it is the large houses and the monopoly groups that will very rapidly start to nominate the scene. The existing distribution of assets and wealth are such that it is these groups which have the capability to expand, surplus to invest, entrepreneurship to promote and capacity to mobilise savings from all sectors. In other words, a neutral economic policy through a process of liberalisation and encouragement of growth would initiate a competitive process. But it would soon degenerate into monopolistic or oligopolistic situation.

One cannot, of course, have a set model of capitalist development for such an economy. But it helps understanding if we identify this potential of development as a combination of the Brazilian and South Korean types of development. It may have some large public enterprises, but the economy will be dominated by large and monopoly houses in combination with multinationals. It may build up a thriving modern sector, but surrounded by a large hinterland of backward and poor population. Exports will have to play an important role in this economy, but instead of being a leading sector, in an economy like ours, they are more likely to be a necessary support for maintaining its viability. Instead of being an export-led growth it is more likely to become an export-dependent growth.

THIS is not the place to go into the details of this model, but it is worthwhile to get an idea of its very broad outlines. Once the large and monopoly houses reach dominance in specific industrial fields, they would try to maintain a high rate of profit by pushing up the price or by preventing a fall in the price. With rising cost of production, the pressure on the prices will continue to be upward, when the prices are determined by cost with the rate of profit mark up. That is the source of contradiction in this system. Although the total size of the market and demand may sustain large number of competitive industries, there may not be enough domestic demand for specific industrial products at higher prices, unless the process of income distribution is such that the total size of the markets continuously expands. In other words, a monopolistic growth in an economy like ours will soon face demand constraint of its own creation and to overcome that it will have to find export market. But the prices in the export market cannot be controlled by the domestic monopolists, which would invariably be lower than the price they receive at home for the same products. There will, therefore, be increase in pressure on the Government for export subsidies so that the return on exports may be sufficiently attractive and the units may continue to operate without a fall in the overall rate of profit. Exports will not lead to their development. They will be necessary to sustain their viability.

At the same time, they try their best to reduce the cost of production. This is not to pass on the benefits of the cost reduction to the ultimate consumers. It is mainly to retain their rate of profits without having to continuously raise the product prices. Prices seldom fall in such an economy, but costs fall, only to contribute to the rate of profit.

There will be two ways of reducing these costs: Firstly, by reducing the prices of inputs, which would be the result if the Government allows large-scale import of raw materials and capital goods. The domestic prices of these inputs would almost invariably be higher than in the international market. Even if there is no inefficiency, they will have higher cost, because the factor and commodity prices are distorted in a monopoly-dominated economy. Secondly, there will be attempts to import technology that would reduce the unit cost of production. The technology chosen would often be labour-saving, leading to unemployment, which would not naturally be the concern of the monopoly producer. But there will be a search for these technologies and since in the modern world technology transfers seldom go unaccompanied by private investment, there will be a search for partners among the multinationals.

That is how the monopoly houses and the multinationals combine with each other as an inexorable logic of the system. The multinational partners would also help the units to export their products because of their marketing contacts, although they will mostly be interested in the domestic market of India and not so much in letting the Indian companies have a share of their own international market. They could also supply the raw materials and inputs that have to be imported for their production. The Indian company may pay for the association out of its profits but the country as a whole has to pay for it through its foreign exchange earnings from exports. So the dependence on exports will grow, and since these exports may not be able to meet all the import requirements, there will be pressure for borrowing from the international capital market, and from multinalional banks. Export-dependent growth will lead eventually to further dependence on the multinationals.

The other implication of a search for higher profits and lower costs will be the attempt to reduce real wages or to prevent their increase. In the initial phase of such development with the volume of industrial output increasing, there may be some addition to overall employment even if in any individual unit there is retrenchment and pressure on wages. Similarly, there can be some rise in the absolute level of living of some sections of population who can benefit from the spill-over effect of such industrial development. But the degree of inequality will increase with more and more assets and wealth of the country concentrating in fewer and fewer hands.

IN a nutshell, the consequence of this kind of export-dependent monopolistic capitalist development will be a steady growth in the economic power of certain sections of the bourgeoisie. Their interest will conflict not only with the working class but also with small entrepreneurs and petty businessmen. There will be increasing pressure on accommodating the multinationals and for the sake of such accommodation, on reorienting national policies towards greater alliance with the Western capitalist countries. One will increasingly hear the counsel that the independent posture in the foreign policy may upset our position in the international economy.

It is to be noted that if such a development scenario unfolds itself, the monopolist-large houses-multinationals alliance will find the greatest stumbling block on their path in Indira Gandhi. Her image of anti-imperialism will come in conflict with their need for accommodation with the Western capitalists. Her emphasis on self-reliance and growth of indigenous capabilities will clash with their demand for free imports of machinery and raw materials as well as technology. Her promotion of small-scale sector and spread of entrepreneurship will tend to negate the basis of their monopoly growth. And her anti-poverty programmes and incentive-schemes will divert resources away from the banks and other financial institutions which otherwise they could have used. Above all, her emphasis on the growth of the public sector can potentially build the real countervailing power in the system, against this large monopoly houses.

One need not conclude that Indira Gandhi will automatically be able to arrest the growth of these large houses — monopoly elements. What has to be stressed to that the interests of these elements and of Indira Gandhi are antagonistic. Indira Gandhi cannot give up her base if she wants to remain in power. The monopoly elements cannot grow in strength if that base is nor destroyed.

THE antagonism between these elements and Indira Gandhi's base will become clear if one pursues the implications of this model of growth a little further. A major problem for a sustained growth of this kind is that it is dependent on a steady increase in the marketed surplus of agricultural products, particularly of wage goods, such as foodgrains. For this it will be necessary that the surplus farmers should grow faster, for it is they who can increase the market supply. There will be an increasing tendency towards an *entente* developing between the rich farmers and the big capitalists; farmers' savings being increasingly invested in industrial securities. There will be increasing pressure on the Government to reduce the prices of fertilisers and agricultural implements which could increase the rate of surplus in agriculture. Side by side with this tendency will grow the inequalities of the rural areas, development being concentrated in smaller sections of the farm population and the vast masses remaining poor if not getting increasingly impoverished.

Here again there will be another source of conflict between this big monopoly-capitalist and big-landlord combine on the one hand, and the forces represented by Indira Gandhi on the other, because such a system with growing inequalities cannot be sustained for long without repression. It will be impossible for Indira Gandhi to allow such repression to go on in any significant scale because thereby she would antagonise herself from the base of her support — the overwhelming masses of the Indian poor. In fact, every time she puts forward an anti-poverty programme or formulates a slogan that encourages the poor to consolidate, she heightens the consciousness of the people and makes it even more difficult for them to be suppressed. If these monopolist-landlord elements come to dominate the country, they cannot allow Indira Gandhi to continue.

WHERE do the Left forces stand in this scenario? Are they strong enough to withstand the pressure of the reactionary groups on their own without Indira Gandhi? Can they arrest the development of the Indian economy along the path of monopoly-capitalist and big-landlord alliance without the support of the large masses which stand up behind Indira Gandhi and traditionally with the Congress which she represents?

The reactionary groups will try to divide the base of the Left in numerous ways. Since the economy will not remain stagnant, according to this model of development, there will always be crumbs of development which will be available to different sections of the population. The perceptible, even if temporary, improvements in their conditions will bribe them away from any alliance that can prevent this kind of development, particularly since economism has been the cornerstone of the Left movement in India. There will be split in the working class, in the peasantry as well as among the middle class. In the vast complex of the inter-play of pressure groups which, as we have discussed above is the essence of politics, the lines will be drawn not simply on economic terms but also along caste, communal, regional and linguistic affiliations. It would always be necessary for the Left to forge a coalition of interests. Can they do this without aligning themselves with the coalition that Indira Gandhi will have to develop in order to retain power and maintain her leadership of the ruling group?

As during the time of Nehru, the strength of the ruling group, this time led by Indira Gandhi, would depend upon the strength of the groups that form the ruling coalition. If the Left can strengthen these groups and thereby strengthen this coalition, they will in fact strengthen themselves. For given the state of the Indian economy, there is definitely another alternative path of development which is viable and which has the potential for development towards socialism. This is a path of the maximum spread of growth both in industry and in agriculture so that increasingly larger numbers of people can enjoy the benefits of progress. In industry, it implies the growth of small and medium entrepreneurs and in agriculture the growth of medium and small farmers. The overall rate of growth of gross national product may not be as high as the model of monopolist-capitalist growth outlined above, but it can still be a reasonably high growth with social justice, with increasing emphasis on providing subsidies and incentives to the weaker sections and generating indigenous capacity for self-reliance.

It would be wrong, however, to think that this kind of growth can be engineered through regulations and controls only. The growth of productive forces cannot be suppressed if the potential is there just because the Government wants to impose controls. The laws of economics follow the operation of objective forces and the market has ways of manifesting itself in the form of open or black economy if a legal framework is sought to be imposed upon contrary objective tendencies of development. Instead of controlling the growth of productive forces, it would be necessary to guide their development, to let them grow but along the desired channels.

THE only way to prevent the growth of monopolist-capitalist elements is to develop countervailing power mainly in the form of public-sector enterprises, but also supported by the growth of small and medium enterprises. The Nehru era slogan of public sector retaining the commanding heights of the economy has become even more significant today. The public sector must utilise all the opportunities of development that are available to the monopoly and large houses at our present stage of industrialisation. It should enter all the fields, wherever it can sustain itself out of its own investible surplus. It should maintain its command through the prices of its products and services, the profits earned, and finances mobilised. It should become a truly countervailing power. It must be efficient, vibrant and growing without subsidies. It must earn sufficient returns and work to full capacity.

If we have such public-sector enterprises then the alternative path of development that has been broadly outlined can definitely withstand the pressures from the monopoly-capitalist-big landlord alliance. This is not to say that this path of development will automatically lead to socialism. It will again depend upon the strength of the pressure groups that the Left forces will represent and how that strength grows over time and space.

But this is an option that is available to us, an option which Indira Gandhi in her programmes and pronouncements, is trying and has promote. Whether she will succeed in realising these options in practice will depend upon the strength of the coalition of forces she is trying to forge in her favour. If the Left could strengthen that coalition, it would strengthen its own cause. In the context of the state of the Indian economy today the ultimate interest of the Left and the compultions of the ruling group represented by Indira Gandhi have largely converged.□

Of Wars and Pacts

(Continued from page 5)

Communist stand, by linking the present agreement to the Baghdad Pact (Mutual Security Agreement of 1959). Not only that. In many policy utterances made by Pakistan's President during the last two years he has emphatically given the indication that he is interested in building up a "strategic consensus" with the United States in its headlong confrontational course the latter has taken in South Asia, in regard to the Soviet Union. This is diametrically opposed to India's regional strategic perceptions.

One of the mainstays of India's national security policy has been the desire to establish the subcontinental region as a strategic entity free from the cross-currents of super-power rivalry; and for thirty years now, a major obstacle in the path of achieving this regional independence has been Pakistan's security involvements with the USA or West Asia or China. In the 1950s Pakistan jointed SEATO and CENTO, thus subjecting a crucial segment of the sub-continent to cold war pressures. During the years of India's maximum exposure to a Chinese threat, Pakistan's rulers not only sought out China as an ally but invited its presence into the subcontinent, over the Karakorum Pass. When Bhutto ruled, Pakistan was declared a part of West Asia. And now, General Zia has chosen to contribute to the US strategic policy in South Asia.

In these circumstances, so long as India's and Pakistan's security policies do not converge on a common meeting point on regional security, it is difficult to envisage how a no-war pact between the two can hold any significance except as a temporary, stop-gap convenience in order to contrive a respite before contemplating aggression: and that is not what India is seeking.

On the other hand, even if a Treaty of Friendship is acceptable to Pakistan at present, the present talks between India and Pakistan might still lead to a third variation of a no-war pact. In such a variation the participants would remain adversaries on security matters, but might nevertheless come to an agreement on forms of conflict control. This could be a positive outcome from the present talks and one that will carry considerable strategic significance.

During the next decade it is possible that both India and Pakistan will acquire small nuclear armouries. In that case, the mutual nuclear threats would be a destabilising factor for both countries. The two could from now work out a credible pact foreclosing the use of the nuclear option — a sort of mini-SALT Treaty — from which both would benefit. Just as the US and USSR (while remaining adversaries) offered up their cities as hostages (by banning development of ABMs in SALT-I) India and Pakistan could devise like inhibitions to make their non-nuclear declarations credible. Even if that is the only outcome from the no-war negotiations, it would still be a significant achievement. □

We have accepted in India as our objective a socialist pattern of society. That means not only economic organisation but something deeper which involves a way of thinking and living. The acquisitive society, whose chief aim is profit-making, not only brings conflict in its train but is opposed to the basic urge of modern man for social justice. Socialism is based on the growth of material resources as well as social justice and a co-operative method of working.

Jawaharlal Nehru

VOL XX NO 30 SATURDAY MARCH 27, 1982 Re 1

POLITICAL NOTEBOOK

When Caste is King

AN Allahabad High Court Judge was gunned down along with his son late at night on a forest road in South U.P., in what looks like a well-planned ambush laid by a dacoit gang.

This incident, shocking by itself, has hit the headlines as the Judge happened to be the brother of the Chief Minister of Uttar Pradesh. Reports from reliable sources suggest that this outrage was the result of protracted caste tensions that mark both the administration and social life in the entire Hindi region, particularly in its heartland covering UP, Bihar, Rajasthan and Madhya Pradesh. The dacoit gang which had massacred Harijans in Deoli happened to belong to the Rajput community: after some time it agreed to surrender to the police on certain tacit assurances from the authorities. Following that surrender, another dacoit gang leader Chabiram was persuaded by some political elements to offer surrender, and he with his men waited for several days. Chabiram had the reputation of being some sort of a Robin Hood who would not harm women and would rob the rich to help the poor. But Chabiram belonged to a backward community and instead of accepting his surrender offer, the UP police killed him and his men; the villagers mourned his death, and the impression got round that the Rajputs whose preponderance in the administration is conspicuous would not spare a dacoit gang from a community low down in the caste hierarchy. It is even suggested that the hapless Judge was killed by a gang which wanted to avenge Chabiram's killing. Even the UP Chief Minister is faced with threats of revenge.

The entire episode brings out the enormity of caste warfare that has been going on in this Hindi belt. If the Janata Raj in 1977-79 marked the ascendancy of backward communities displacing the dominance of Brahmins in administration and politics, the Congress-I victory in the 1980 poll brought the Rajputs to the forefront because, as a matter of expediency, the Congress-I leadership promoted the Rajputs. The clash between powerful caste lobbies has contributed in a large measure to the virtual breakdown of administration over the greater part of the Hindi belt.

What is indeed amazing is that only the day after the Judge's assassination,

the Union Home Ministry's annual report was presented to Parliament, claiming that the overall law-and-order situation in the country has shown a distinct improvement. Not only the Hindi belt, the country is yet to recover from the shock of communal violence in Maharashtra and is still reeling under the new-dimension communalism in Kanyakumari at the southern tip of the land. But the Home Ministry report calmly claims that the *number* of communal incidents has come down over the past year. There has been tension again in Aligarh, and violence in Baroda, in the past few days, not to speak of the continuing social or sectarian tensions in other parts of the country, whether in Assam or elsewhere in the north-east, or in Bihar or in Punjab or in Gujarat. For sheer complacency in the face of harsh reality, the Union Home Ministry under the nonpareil Giani Zail Singh is unbeatable.

Not that the police has been inactive. Loud claims to the contrary, there have been in States like UP and Andhra Pradesh fake encounters staged by the police to get rid of troublesome rural workers seeking minimum wage or human conditions of living. And yet Zail Singh's extraordinary set-up sees nothing but improvement in the law and order situation all over the place. Would that we were all blessed with the same kind of blindness which so resembles bliss!

Ironically enough, amidst the smugness that permeates the Ministry's report, note is taken carefully of the increase in labour unrest and of the militancy of trade unions, of student unrest, and the like, without however going into the causes or sensible remedies. The sense of physical insecurity that prevails among citizens in many parts of the country, including the national capital, and certain sensitive border areas, would seem in the eyes of the Home Ministry to be less important or urgent than the "militancy" of trade unions and the working people's demonstrations or struggles to secure a part of what is legitimately due to them as the producers of national wealth. Organised crime, of which the marauding dacoit gangs of UP are a symbol, and the nexus between criminals and some of our politicians, which raises the social status of killers and robbers and renders even evidently had little impact on the Giani's dominion. What is described as the Left-wing extremist movement is presumably of greater concern to the Ministry than plain bestiality, ranging from dacoit outrages to massacre of Harijans or armed attacks on minorities.

In a recent survey report the Government itself expresses concern at the crime growth rate having gone beyond the rate of population growth in the last two decades, warning that "if the trend continues, growth of crime and population would outstrip the growth of police strength in the ensuing decade."

Most disturbing of all is perhaps the fate of the much-advertised anti-dacoit operations in UP, India's most populous State. It is clear that many gangs are still very active, some dreaded ones having established a base for themselves and some others having established political links or links with the police or both. Coupled with caste civil war, the easy availability of lethal weapons, including sophisticated firearms, to criminals on the rampage is a factor with grim potentialities that has not been adequately understood by the powers-that-be, though we are now told that the Government is "examining measures to regulate the availability and use of arms by the public." Even the large-scale issuance of firearms licences in the last few years is difficult to understand, and what steps are being taken to end the traffic in unlicensed arms cannot be said to be clear. This is true of UP, Bihar and many other areas, and new areas are getting involved in the murderous racket. Whether or not any "foreign hand" is involved, it is a fact that weapons with foreign markings are seized now and then. The public has a right to know more about all this. Is the Home Ministry in a position to furnish the answer? If not, what is the justification for its huge apparatus?

To point out all this is neither to ignore the good work done by some officers and men of the police force in some places, nor to raise a hue and cry just because it is a Judge or a Chief Minister's brother who happens to have received the fatal bullet this time. A police official has been quoted as complaining of total neglect of research in this sensitive sphere; others have pointed out that honest and upright officers quite often end up facing punish-eased out for incompetence, corruption or worse. But how do we set about rectifying this situation? Who is to take the initiative? The straight and simple answer would seem to be, the Central Government, but it is the Centre's Home Ministry, once handled by stalwarts and now under the control of comic-strip characters, which is to blame for the deterioration in recent times. If the ruling party has often found the company of dacoits and thugs congenial, some of the Opposition parties are no better; it is hardly necessary to go into the history of the parties and forces behind organised communal riots or casteist violence.

If the curse of casteism is to be eliminated, it has to be attacked not merely as a law-and-order problem, but a socio-economic challenge polluting our national life. Mere pontificating on caste evils by politicians will not do. In our daily life it has to be combated while measures, both political and constitutional, need to be taken to deal with its baneful effects in our political life.

Democracy and casteism cannot coexist.

COMMENTARY

Doctors in Distress?

The convulsion that lately racked India's premier medical institution appears, on the face of it, to have subsided. The Bihari MP who started the furore with charges of incompetence against two prominent cardio-thoracic surgeons has been quietly backing off from his earlier allegations. The Prime Minister has intervened on behalf of the two doctors, who have been exonerated and persuaded to withdraw their resignations. 'Political interference' has been denounced, and the 'honour' of the All-India Institute of Medical Sciences, held at the height of the melee to be the issue at stake, has been vindicated to the satisfaction of those involved.

But the AIIMS case is not simply a morality play depicting an injustice redressed. The attack on Dr Gopinath and Dr Venugopal is neither the first of its kind nor will it be the last. Some years ago, a brilliant surgeon at the AIIMS was slandered in a cowardly manner through a planted press report about his 'colour-blindness'. The more exacting and conscientious a doctor is, the more he drives himself and his juniors to work, the more he shows up the mediocrity and sloppiness of others and excites the malice of the meaner sort. So it has been with the cases mentioned: Dr Gopinath, it seems, is even less dear to the Resident Doctors' Association on account of his irascible temperament and tyrannical insistence on standards. The 'colour-blind' surgeon's competence to perform the complex operations in which he is a specialist, acknowledged world-wide, was questioned only when he took a public stand on the appointment of a politically powerful senior colleague's favoured candidate. If you rock the boat, you can expect to get mud splashed on you; lie low and bob along on the scummy surface with the rest, and you'll be safe: a common enough phenomenon in public institutions, and all the more so in a high-profile outfit like the AIIMS.

The Gopinath-Venugopal episode has provoked some media exposure of the political machinations within the Institute, the shortage of facilities, and the ramshackle infrastructure, and rightly so; but not enough of an outcry, and certainly not enough analysis among those who currently decide how we shall live or die. It is only to be expected that political VIPs will meddle in the Institute's affairs, cultivate lapdogs, jump queues, etc, etc.

Health is at the top of everybody's priority list and the AIIMS, for all its deficiencies, presents a concentration of medical expertise which is present only in isolated pockets in the country. Thus, about 80 per cent of the patients who throng its corridors and wards come from outside Delhi, mostly from UP and Bihar, Rajasthan, Madhya Pradesh and Jammu & Kashmir (and, in recent years, from Afghanistan and Yemen). At least half of these patients from neighbouring States are among the poorest in the land, and the most seriously ill. They choose to endure the discomfort of travel, grope their way through the chaos and hubbub of the various departments, put up with harsh words, rudeness and indifferent paramedical attention. Why? Bihar, the home State of the irate Paswan, sends up a substantial contingent — health services there being either non-existent or at rock-bottom, in terms of both medical competence and honesty. Perhaps that is what the honourable parliamentarian should exercise his ire upon — since he is apparently in a position to make waves — rather than confine his indignation to the death of his kinsman through the alleged negligence of AIIMS doctors.

We are forced each time to come back to the tired old story of demand, supply and distribution. As long as you have huge multitudes of poor, malnourished people without elementary health facilities, a system of health care which is alien and inaccessible to them, a health establishment which views medical care as a commodity to traffic in, you will have a stampede at the AIIMS, and shins are going to get broken — but not of the kind of doctor who curries favour with the powerful and sees only VIPs by appointment in his out-patient clinic. He will continue to collect his awards and junkets abroad.

A doctor, after all, is as fallible as any of us; it is the frailty of our flesh that gives him his almost magical power. Struggling with pain, illness or death, we are as vulnerable before him as before a deity or a beloved; and this happens whether we are high or low, whether our doctor is a sage or a quack. He can use this power either "to alleviate human suffering and preserve human life", in the tradition of the great healers of the past, from Hippocrates and Galen to Lister and Jenner, or to exploit human misery in order to accumulate wealth and influence, or simply to make a living. His choice of motivation depends on his temperament and upbringing; and the question raised by the AIIMS affair is not fundamentally whether Doctor X or Y is a good guy or a rotten egg, but how we intend to develop health services in the country.

About 90 per cent of illnesses are self-limiting; this means that most complaints eventually just go away, having been dealt with by the body's own defence mechanisms — and also that 90 per cent of medical intervention is statistically bound to succeed. This does not imply that no help at all is necessary; in fact, the act of demanding and receiving help is in itself profoundly therapeutic. But it does call into question the kind of investment of effort, time and money we put into producing the kind of drugs and doctors we have. Certainly we need high-expertise models like the AIIMS, to deal with grave illnesses and to promote research and development; but what we need much more urgently, at this stage, is an army of health workers equipped with basic training in treating everyday minor complaints and detecting major problems to refer to hospitals and doctors. It has been done with enormous success elsewhere — China being the trail-blazer in this area — and, if we are serious enough to take up cudgels against the prejudices of the medical establishment, it can be done, and must be done in India.

A book recently published in India, *Where there is No Doctor*, written by a visionary activist called David Werner, provides a blueprint for a solution to our problem, if anyone out there is listening or cares. Otherwise we can look forward to more scandals, influence-mongering and scrambles in the citadels of privilege and more death and disease in the wasteland surrounding them.

SCRAPBOOK

Human Rights, Reagan Style

Western correspondents stationed in India, especially American, keep their eyes open for the slightest opportunity to denigrate India, and readily pick up news items and comments in our media, particularly the press, to serve this purpose. But Indian correspondents posted in the Western countries, especially the United States, generally turn the blind eye to even ugly situations and extremely undemocratic practices in a country which presumes to consider itself the leader of the "Free World", the democracy of democracies.

Here is an example: a longish, shocking story of discrimination against blacks, published quite prominently in the *Washington Post* (March 6, 1982). It tells of the blacks in one county in South Carolina who are systematically denied the right of representation and whose rights are now sought to be permanently frozen by the Reagan Administration, aided and abetted by the very Senator, a conservative, supposed to represent the constituency. The following excerpts from the *Post* report speak volumes:

HALF the population of Edgefield County is black. Until the 1980 census the blacks were in the majority. But in the last 100 years a black has not won against a white candidate....

That disparity has had ... predictable results. Streets in white neighbourhoods are paved; in many black neighbourhoods they are not. White neighbourhoods have sewage systems; most black neighbourhoods do not....

Eight years ago some blacks here went to court to overturn the county electoral system which, they said had shut them out of their rightful share of local power. In 1980, under the old test of what constitutes a voting rights violation, they won their case. Four days later the US Supreme Court said a different test should be used, the test that the Reagan Administration, (Strom) Thurmond (local Senator) and other Congressional conservatives want to write into the law.

If the new Supreme Court standard is written into the law, blacks in Edgefield County and in other parts of the country say they believe it will become almost impossible to win a voting rights case.

The problem, as far as Edgefield County blacks are concerned, is the at-large election system. Although blacks make up a solid majority of registered voters in two of the county's five election districts, there is a county-wide open election where voters can vote for all five county commissioners. Because whites do not support black candidates the blacks don't win.

(The trial was held in 1975, and District Court Judge Robert Chapman withheld his opinion, believing the state legislature would take up the issue; finally on April 17, 1980, he declared the county election system unconstitutional).

Chapman found that "whites absolutely refuse to vote for a black" ... No black has ever received a Democratic nomination or been elected to public office against a white candidate in Edgefield County. He found that blacks were excluded from the jury system, and that, until the trial began, blacks were excluded from county employment.

(After recounting how desegregation was turned into a mockery at Strom Thurmond High School) he said (the) County has "a long history of racial discrimination in all areas of life. There is bloc voting by the whites on a scale that this court has never before observed, and all advances made by blacks have been under some kind of court order. Black voters have no right to elect any particular candidate or candidates, but the law requires that black voters and black candidates have a fair chance of being successful ... Black participation in Edgefield County has been merely tokenism, and this has been on a very small scale." Chapman ... ordered the county not to hold elections until a "new and constitutional" system could be adopted.

But four days later the US Supreme Court (in another case) ruled ... that plaintiffs must prove that local officials consciously intended to discriminate against blacks. Edgefield County blacks had proved only that the system had the effect of discriminating against them. *Chapman had to reopen the case).*

There is a clause in the Voting Rights Act requiring states such as South Carolina, with a history of racial discrimination, to submit any changes in voting laws to the Justice Department for approval. Edgefield County made changes in 1966 and 1976 without obtaining the required approval....

Last fall the House overwhelmingly approved legislation extending that section indefinitely and clarifying the standards of proof to allow plaintiffs anywhere to prove a violation of the law simply by showing that their election laws are discriminatory in effect. So far nearly two-thirds of the Senate, 65 members, have agreed to support that bill.

But in spite of the specific language of the bill barring any requirement of proportional representation by race, the Reagan Administration is strongly opposing the measure and is asking Congress to adopt the "intent" standard. ...

Charles Coleman, the county attorney bridles at outside criticism that in the county whites refuse to vote for blacks. "I don't think that's any of their business. It's my prerogative, my right. If I want to vote white, it's my business," he said....

Coleman said the real problem in Edgefield Country is that blacks don't vote. ...

Willie Bright, a black born here 44 years ago, has worn out the tires on his car trying to get blacks to register and vote. But he understands why they don't.

"If you've never been poor, there's no way you can understand," he said. "Whites don't understand poor blacks. Lots of blacks don't understand poor blacks. Black poor people expect white people to run everything. It's always been like that. When you're poor, you're worried about existing today, not what's going to happen tomorrow."

Nathaniel Jackson, president of the local NAACP, said most Edgefield County blacks work on "white-owned farms, in white-owned kitchens. They may rent their homes from whites. In countless little ways they are still dependent on whites. And they are reluctant to take a chance on offending those whites."

Bright added that blacks are still not comfortable going to the 142-year-old county courthouse on the old-fashioned town square to register. It is still a place where whites are in charge, and, historically, the courthouse meant nothing but trouble for blacks. ...

FOCUS

Women's Honour : Battle Is On

ANJALI DESHPANDE

UNNOTICED, unhampered, Delhi is smoothly sinking into an abyss of no culture. Traditional values lie abandoned, and modernism has not succeeded in penetrating deeper than the skin. People still cling to the age-old images of the ideal woman who would stay confined to the kitchen, would not dare go out unchaperoned. Women out at work or in colleges are deemed fit to be trifled with, and a woman visiting a restaurant without the protective arm of a man is just not tolerated. Traditional culture, not ideal in the modern context, is being systematically destroyed without anything positive to replace it. We float in a cultural vacuum, and wild abandon and anarchy are the rule.

Open-air and closed-door strip-tease and semi-strip-tease acts, in the name of cabarets, are mushrooming all over the city. Borrowed disco tunes are percolating from the upper strata to the lower-middle classes. It is pathetic to watch distorted, vulgarised versions of the *bhangra* being danced to the tune of these jarring discs. Bombay films tirelessly drill the image of the 'nice woman' rescued at the eleventh hour by a strapping hero, implying that nothing bad can ever happen to the *Indian Woman* and at the same time teaching woman to bank upon someone else's muscle instead of developing her own personality and physical strength to deal with a world growing more and more brutal and cruel every day. Some years back the cultural invasion was slow and gradual. Now the pace of the onslaught is growing. It took a decade for a perceptible change in the past, and now it takes just a day.

Molestation of women has not been rare in this accursed capital city, on the campus or outside it. The recent campus incidents got attention because of publicity and the firm legal action insisted upon by the students, teachers and principal of Indraprastha College and taken by the police. The molestations in the vicinty of a single college for four days reveal how eve-teasing a most inexpressive word to describe the insults heaped upon women every day by all and sundry everywhere — is being used as a political weapon to discourage women from venturing out of their homes, to force upon them the image and role of the "ideal woman" nurtured by tradition.

The first day, on March 17, a girl from Miranda House was chased by eight men loaded in a car and on a motorbike, in broad daylight (2 p.m.) on Mall Road; frantically seeking protection she landed in a police officer's-house, the eight boys were arrested and the publicity began. No eyebrows were raised when it turned out that one of the hoodlums was an ACP's son, but the miscreants being taken into custody so promptly, despite the ACP's son, did generate some astonishment, demonstrating how rare a nugget dutifulness has become.

Predictably, the police did not deem it necessary to keep a vigil on the Mall for the next few days, especially since the accused, identified and booked, were safely behind bars. Next day eighteen boys accosted three girls of IP College, on their way back to college from a restaurant not very far from the college and generally considered a part of it, and molested one of them, slapping another.

At the time one girl was separated from her friends and the other one was being slapped at the gate of restaurant, and the girls were shouting for help, about twenty-five customers in the restaurant went on calmly devouring their chowmiens while the six waiters continued serving, unruffled. Although the ring-leader of the gang of eighteen, Pavan Verma, and his closest associates who were regular customers of the Madhubans restaurant had been spotted even before they began teasing the girls and making obscene remarks, the owner of Madhubans flatly denied knowing them when the police asked him the next day. And this after a waiter had given all information about Pavan Verma to the girls the day before the incident.

When the girls returned to college after that, the constable supposed to be doing his shift duty outside the college was as usual nowhere to be seen. The girls gave the police an earful when the latter swarmed all over the place taking down statements. But this did not deter two CRP men from molesting girls at the gate of the restaurant the next day! The restaurant owner had requested two CRP men, two *pahalwans* from the Chandagi Ram Ka Akhara and two other toughs to guard his joint. These six men, presumably posted at the gate to protect women customers, molested girls. As the news spread and students from IP hostel rushed to the spot and began questioning the molesters, the police whisked away the CRP men in a jeep. It is said in the campus that the two *pahalwans* have intimate contacts with the police as they are hired by the police to rough up persons considered a nuisance.

Since than the CRP has approached the principal begging her to drop that particular case—and the concerned CRP men magnanimously offered to touch the feet of the girls. The CRP's honour, if any be left, was at stake, and worse, the two men would lose their jobs. In India being unemployed may be worse than going to the gallows, but the girls or the principal are in no way obliged to help save their jobs. The attitude of policemen is clear from a comment made by a constable during investigation: "If they wear jeans and go out with boy friends, they deserve to be molested," he said.

Publicity for these incidents is already showing its effect on two fronts — legal and social. The Principal of IP College has emphatically stated that they are not going to drop any case, nor raise the walls of the hostel to imprison girls and give them a false sense of security. The students are bent upon bringing the guilty to book. For the first time a case of "eve-teasing" is receiving wide support.

On the domestic front, parents are relucant to send their daughters to college. Many students dislike the publicity for it creates problems at home. Yet they realise there is no way but to fight at home as well as outside. The shocked silence is breaking. Parents of the victims do not want the cases to go on, they do not want their daughters to appear in court, to be stigmatised. The social stigma is the hurdle that stopped the Principal of St. Stephen's College last year from registering complaints about Holi molestations inside the college despite loud protests from the girls.

First and foremost, women have to shake off the false image foisted on them — and learn not to feel ashamed when in fact is not they who are in the wrong. They are not the sinners. The young women in IP College have managed to fight their families and insist on legal proceedings. The policeman, the loafer, the gardener at the college, the father all argue on the same premise — that if only she had stayed at home nothing of the sort could have happened. Yet many girls are realising that to live with heads bent, turning a blind eye to everything, is far worse than appearing in court.

A sense of acute insecurity is still pervasive. Even if the girls do get lessons in self-defence they need courage inspired by security to use the techniques. And as it is, few know the art of self defence. Women are given to dressing up and appearing smart; there is nothing wrong in being well-dressed but modern women must learn not only to value their bodies but to trust their physique. The body can with proper training be a wonderful weapon.

The general public are apathetic in the rare instances when girls do try to hit back at anyone trying to harass them. People in general are apathetic because they are afraid and they feel guilty. They are afraid of the collusion between the goondas and the powerful people behind them. Some are themselves guilty of teasing. Sensible, aware women and men have to break the sense of insecurity and assist those who have found courage, moral, psychological and physical, to fight back. It is not a skirmish, it is a war. The fight will neither be easy nor a minor one, for it strikes at the very roots of the social system. The battle has just begun.

The Public Account Car

R.K. SACHDEVA

SETH is a typical self-employed businessman. He buys a brand-new car every two years and his entire family makes use of it. He is not affected by either the five-fold increase in petrol prices or the three-fold increase in the price of a car during the last ten years—for he does not spend anything either on the purchase or on the maintenance of his car. He makes others spend on it.

Only a few days ago, he bought his latest for Rs. 72,000 from the showroom and disposed of his previous car which he bought about two years ago. He has bought this car in his business account which indeed he did in the case of his earlier ones also.

He bought the car which he has just sold two years ago for Rs. 50,000 against borrowed capital from the bank at 15 per cent interest. During the period of two years, he spent Rs. 500 a month on petrol and maintenance of the car. The total expenses entered in his business accounts for the maintenance of the car during the period of two years were three-fold, namely: (1) interest on capital at 15 per cent per annum or Rs. 15,000 for two years; (2) depreciation at 20 per cent on book value, that is, 20 per cent of Rs. 50,000 or Rs. 10,000 during the first year and 20 per cent of Rs 40,000 or Rs 8,000 during the second year, making a total of Rs 18,000; (3) operating cost at Rs 500 a month or Rs. 12,000 during the period of two years.

So, the total expenses entered in his accounts were a sum of Rs. 15,000 on interest, Rs 18,000 on depreciation and Rs 12,000 on operating costs, making a total of Rs 45,000.

Seth keeps his accounts straight and makes no secret of the fact that he uses the car for his own and his family's purposes. So the income-tax rules allow him to debit only two-thirds of his total expenses on the car to his business accounts, that is, a sum of Rs 30,000.

Seth's income falls in a high bracket and his income-tax liability for a marginal income of Rs. 30,000 would have been of the order of Rs 20,000. So, the net post-tax cost to him as per his books for the maintenance of his car during the

(Continued on page 34)

Lilmuni Manjian is Dead

A CORRESPONDENT

ON Sunday, March 7, at nine in the morning, Lilmuni Manjian of Sonajori village, Jabagudi panchayat, Madhupur Block in Bihar, died.

In actual fact she didn't simply die, she was killed. She was killed by the people who tolerate a social and political system that provides medical care only to the rich and to townspeople and denies it to poor villagers. Of those people who tolerate and therefore perpetuate this state of affairs doctors themselves are very largely responsible. It is indeed ironic that society holds doctors in such high regard when they are often responsible through their callous and undisguised pursuit of money and prestige for so many deaths. The case of Lilmuni Manjian is a particularly shocking example.

Having borne two children without undue difficulty the birth of her third child seemed unlikely to cause trouble. She did not, of course, have any antenatal care which might have foreseen and helped to avoid a difficult labour. Indeed, the idea of antenatal care would have been quite a new one to her. She went into labour on the morning of March 4, and by evening when the baby was not born it became apparent that something was wrong. Her labour pains stopped. This was Nature's way of protecting her, for if the pains had continued and the birth of the baby was obstructed she would surely die. Nature protected the mother's life, but sadly the baby had already died.

The relatives spent the next day anxiously waiting for the return of a volunteer nurse working in a village about two miles away. She arrived as night fell and went to her in spite of the walk across fields and a stream in the dark and heavy rain. As there was nothing that could be done immediately she sedated her and passed a catheter to relieve her distended bladder and returned home with difficulty at 1 a.m. At 7 a.m., as her condition had become weaker an intravenous infusion of dextrose was given and, as there was some uncertainty of being able to take out the baby there, it was decided that in spite of the difficulty of carrying her, she should be taken to a doctor in Madhupur, who would be able to extract the dead baby after which her condition would surely improve and her life be saved.

She was carried six miles to Jagdishpur station and from there by train to Madhupur. She was weak but her pulse had improved following the infusion and she was quite conscious and talking. At this stage there was 90 per cent chance with skilled and immediate care of saving her life.

The doctor, a professed "Christian" and Vellore-trained surgeon who has the expertise and facilities (he performs Caesarian operations when required) refused to treat her. He said and I quote, "They are Santhals, they will not pay." The nurse said that if they could not pay she would pay. He said, "I have no nurse, I can't expect my wife to help such a case." The nurse said, "I am here and will help." When he could say nothing more he became angry, and went inside again telling them to take her away.

She was taken to another doctor who at first agreed to treat her, then changed his mind saying he had no instruments to take out the baby. He even refused to let them keep her on the veranda outside until other arrangements were made. The reaction of the nurse there, which is not uncommon, was to blame the villagers for her condition. Is it a villager's fault that he lives in a village? Is it his fault that in the village there are no health facilities whatsoever for miles around? Was it the woman's fault that the baby's birth was obstructed and the baby died?

Three other doctors in Madhupur were contacted; of them one was away, one was about to go out, and one, the Block Medical Officer, said he had no instruments. Madhupur is a town of about 40,000 population and the Block headquarters of more than 500 villages, and the Block Medical Officer has no forceps or equipment to treat an obstetric emergency.

By now it was 1 p.m. The nurse bought a bottle of saline and infusion set and with difficulty put up an infusion to keep the woman alive while the search for help continued. After much trouble, with the co-operation of one doctor before he went out, a jeep was borrowed and the woman was taken in it to Deoghar subdivisional general hospital 37 miles away reaching there by about 5 p.m. The woman survived the terrible bumpy journey on the floor of the back of the jeep but was becoming delirious. The doctors were reluctant to do anything saying she would die, One of them, seeing the concern of the nurse for a poor villager laughed at her behind her back. After persuasion they agreed to try and at about 6.30 p.m. they succeeded in extracting the dead baby under general ansesthetic. The woman having somehow survived the journey, survived the general anaesthetic and the bleeding which, luckily, was slight, following the birth. There was hope. Now with skilled attention if her weak condition (she was in "shock") could be overcome with careful monitoring and proper use of drugs and infection checked, she could still survive. But this sort of attention is not for a poor villager in a government hospital. Her blood pressure was not checked, her temperature was not taken, there was no spirit to wipe her skin before the injection, there was no tape to secure the needle of the intravenous infusion, there was no suction to clear her throat when she was still unconscious after the anaesthetic, there was no oxygen cylinder. Here these, the most elementary medical facilities, are only for the rich and influential. Her body, unrecognisable as her former self, gave up the unequal fight.

There are those who will say that she was bound to die or that it was God's will or that all that could be done in the circumstances was done. I do not agree. Lilmuni Manjian's death was by no means inevitable. It was the direct result of collective negligence. it was a shameful waste of a young woman's life. Even those doctors and others who wished to help were rendered ineffective and demoralised by the general indifference. Those that treated Lilmuni Manjian as less than human, in so doing became de-humanised themselves. If this story can in any way help people to care and to think about the social causes of her death, her death will not have been completely useless. These things must change and will change if enough people care and if those who care speak out and are not numbed by a feeling of helplessness or fear for their personal safety. To care does not require a particular ideology, religious or political. It means simply to recognise that we are all human beings and if we help each other we can make life better and happier for everyone.

New Nuclear Balance

M. SHANKAR

On March 16, 1982, Soviet President Leonid Brezhnev fired another salvo in the "battle" for "peace" in Europe which is being fought as much at the negotiating table in Geneva as in the mind of Mr X, the average European citizen increasingly concerned about the continent and precarious nature of his existence in a nuclearised continent — about the dangers of living in the shadow of a potential holocaust.

Speaking at the 17th Congress of Soviet Trade Unions, the Soviet President suggested a wide array of arms control measures, including some specific proposals concerning its medium-range missiles deployed in the European theatre. These included the decision to "introduce, unilaterally, a moratorium on the deployment of medium-range missiles in the European part of the USSR," as also the intention to reduce, during the course of this year, "a certain number of its medium-range missiles on its own initiative." The unilateral freeze on deployment would continue to be in force, he said, until an agreement was reached on the reduction of medium-range missiles in Europe or until the Americans began "practical preparations to deploy Pershing 2 and Cruise missiles in Europe.

The other suggestions made by Brezhnev included (i) the resumption of strategic arms limitation talks and a mutual commitment not to undertake a new arms build-up by deploying sea-based or ground-based long-range missiles, and (ii) a mutual restriction of naval operations including the restriction of the area of operation of missile submarines, and confidence-building measures, particularly on busy sea-lanes.

The reaction of Western leaders to the Brezhnev proposals has been, expectedly, cool and skeptical. They have pointed out that the freeze promised by the USSR is nothing new and would not materially affect the situation as the Soviets have already deployed between 250 and 300 SS-20 missiles since 1978. Moreover, as the SS-20s are mobile warheads, not based in concrete silos, they have argued that any decision not to deploy new missiles in the European part of the USSR is meaningless as additional missiles could easily be moved west of the Urals if occasion demanded. The 4000 km range of these missiles would, the West Europeans allege, in any case place European targets within the reach of missiles stationed in the eastern USSR. President Ronald Reagan, for example, held that "the proposed nuclear freeze simply isn't good enough...If President Brezhnev is serious about arms control, and I hope he is, he will join in real arms reduction" and accept Reagan's earlier offer of a "zero option." Other US officials dismissed the Brezhnev speech as a "propaganda ploy" and "yet another transparent effort to disrupt NATO unity."

Undoubtedly the Brezhnev speech, like President Reagan's earlier offer of a "zero option" — which proposed the dismantling of all SS-4, SS-5 and SS-20 missiles in exchange for a US commitment not to deploy 572 Pershing and Cruise missiles under a 1978 NATO decision to modernise nuclear forces — is in part a public relations exercise. Public gestures and pronouncements the world over are designed to appeal to public sentiment and rarely ever, particularly when parallel negotiations are going on, provide or are intended to provide a realistic basis for negotiations.

While the media is a routine tool of diplomacy, appeals to public opinion on the issue of stationing new missiles in NATO countries assume greater importance in the face of the burgeoning peace movements in Europe. Last year hundreds of thousands of anti-nuclear protestors marched through the streets of European cities. Though the intensity of these protests has weakened since the imposition of martial law in Poland, Brezhnev can, by throwing this public gauntlet at the USA reasonably hope to reactivate the European disarmament, movement, thereby increasing pressure on the US Government to reach an agreement at Geneva and resume talks on limiting strategic arms. At the same time the Soviet Union can capitalise on the growing sentiment against an uncontrolled nuclear arms race that has surfaced within America itself.

For the first time within the United States disarmament issues have moved to the centre of the political stage and are becoming the focus of popular protest. In California over half a million people have signed a petition for a mutual US-Soviet freeze on the production, testing and use of nuclear weapons. In Vermont 155 town meetings have endorsed resolutions calling on the state legislature to send a petition to the US Congress urging a similar freeze. The "freeze movement" has surfaced in several other US states — Massachussets, Connecticut, New Hampshire, Maine, New York, Ohio, Wisconsin, Minnesota, Oregon and Washington. The resolutions by Senators Edward Kennedy and Mark Hatsfield calling for a "mutual and verifiable freeze on the testing, production and further deployment of nuclear warheads, missiles and other delivery systems" has won support from 17 Senators and 122 Congressmen. The disarmament movement in the United States has support at the grass-roots level from the Roman Catholic Church, ecological groups and on the campuses. The rationale as in Europe is provided by Reagan's macho talk, of reasserting American military superiority, the enormous defence budget and weapons procurement programme and the deteriorating economic situation.

The author is Research Fellow, Institute of Defence Studies and Analyses, New Delhi.

More significant than the Soviet desire to provide a public earnest of its interest in arms negotiations, however, is the fact that the Soviet leader, for the first time, has made a declaration that any American move to substantially upgrade its missiles in Europe would be considered an unacceptable alteration of the strategic balance and would evoke reciprocal action on the part of the Soviet Union. "If the governments of the United States and NATO allies", Brezhnev warned, "were, actually to carry out their plan to deploy in Europe hundreds of new American missiles capable of striking targets on the territory of the Soviet Union, a different strategic situation would arise in the world. There would arise a real additional threat to our country and its allies from the United States. *This would compel us to take retaliatory steps that would put the other side, including the United States itself, its own territory, in an analogous position*". (Emphasis added)

Some Western commentators have interpreted the veiled Soviet warning as a threat to place missiles in Cuba. Most have, however, dismissed the threat as bluster and bluff and have chosen to see in it a concession to the Soviet hardliners, particularly the armed forces. While there is no doubt that there are voices within the Soviet establishment demanding a tougher posture vis-a-vis the USA (Marshal Ogarkov's recent plea for an increase in defence expenditure to modernise Soviet nuclear arsenals and conventional equipment in order to meet the US threat, comes to mind), it would be worthwhile to examine whether there is any validity in the Soviet assertion that the deployment of 572 Pershing and Cruise missiles would substantially alter the strategic balance.

Though different figures have been bandied about regarding the number of medium-range delivery systems and nuclear warheads deployed by the two sides in Europe, the Soviets themselves have conceded that the Soviet Union has an edge over the West. In an article by Lt. General Nikolai Chervov the Soviet Union published figures which included all US and allied launchers capable of reaching Soviet soil. The launcher total for NATO came to 1031 and to 1055 for the Soviet Union, leaving the Russians with an edge in warheads of 2035 to 1482. But the Soviets contend that if Washington deploys, as planned, 572 Pershing-2 and Cruise missiles, the balance would tip to the advantage of the Western alliance.

The debate over numerical superiority in theatre nuclear forces has helped to cloud an understanding of the real issues involved, for the Soviet Union has had superiority in medium-range missiles ever since the Americans withdrew the Jupiter and Thor missiles from Europe in the wake of the Cuban missile crisis. This superiority was acceptable both to the United States and to West Europe. The Soviet Union could deter a US attack by holding Europe "hostage" and the West Europeans in turn could rely on the protection afforded by the American strategic superiority in inter-continental ballistic missiles to deter a Soviet attack on Europe. The credibility of the American nuclear guarantee however began to be increasingly questioned by West Europeans as the Soviets achieved near-parity with America in the strategic realm leading to the two-track NATO decision to modernise theatre nuclear forces and begin negotiations on limiting these forces with the Soviet Union.

The Russians argue that the SS-20 missiles are a replacement for the earlier SS-4 and SS-5 missiles and have the same range. They hold that under the guise of modernising their nuclear forces in Europe the Americans are attempting to tilt the nuclear balance against the Soviet Union. While Russian intermediate range missiles can only reach targets in West Europe and not in the United States, American intermediate range missiles in Europe would be able to target the Soviet Union itself. They would substantially reduce the warning time available to the Russians as their flight time would be much shorter (as low as 6 to 7 minutes for a Pershing missile placed in West Germany) and the trajectories would be lower.

Now, for the first time, the Russians have invoked, even though obliquely, the agreement reached with the United States at the time of the Cuban missile crisis in 1962. While the Soviet Union officially agreed to withdraw its missiles from Cuba in return for a lifting of the US naval blockade and guarantees of non-intervention in Cuba, Khrushchev also demanded and received a tacit US assurance regarding the withdrawal of US missiles from Europe, in particular from Turkey. This has been mentioned by Khrushchev in his memoirs and is confirmed by Robert Kennedy in his account of the Cuban missile crises — *13 days*. In a private meeting with Dobrynin, the Soviet Ambassador in the United States, Robert Kennedy, while refusing to agree on a public quid pro quo over Soviet missiles in Cuba and American missiles in Turkey, assured the Soviet Ambassador that "President Kennedy had been anxious to remove those missiles from Turkey and Italy for a long period of time. He had ordered their removal some time ago and it was our judgement that within a short time after this crisis was over, those missiles would be gone". On April 25, 1963, five months after Robert Kennedy's talk with Dobrynin, the US missiles were withdrawn.

Most experts agree, however, that though the Soviet Union's decision to remove its missiles from Cuba and avoid a collision with the United States may have been facilitated by the American assurances on Cuba and on European missiles, it was also dictated by the weaker military position of the Soviet Union and its immense nuclear inferiority. Today if the Soviet Union were to place missiles in Cuba in retaliation against the placement of American missiles in Europe (as it has obliquely hinted) the situation would be far more dangerous as the United States would confront a near equal adversary.

Nothing brings out more horrifyingly the increasing risks of a nuclear war and the imperative need for speedy disarmament. The proliferation of nuclear weapons, the improvements in the speed, range, accuracy and yield of these weapons, the advent of an era of sweeping technological advancements in anti-ballistic missiles, anti-satellite and submarine technology, particle beam and laser weapons, and the growing shift towards nuclear war-fighting doctrines drive home the compelling necessity for the two super-powers to reach agreements on limiting, freezing and reducing their nuclear arsenals. □

South-South Meet : Two Facets

N.K. SARKAR

THE Cancun Summit became a failure because of the intransigence, obstructionism and the high-and-mighty attitude of President Reagan. When the South-South Conference was called by Indira Gandhi in the wake of the Cancun meeting, the move raised in the developing countries the expectation that it would give a fitting reply to the insolence of Reagan by developing concrete steps for South-South self-reliance. Unfortunately this expectation has not been fulfilled. It has nevertheless served a useful purpose. It is necessary to carefully analyse the reasons for its failure and to understand the positive contribution it has made.

The two most important speeches made on the same day in New Delhi show clearly the differing expectations from the, Consultations. President Nyerere's Third World Lecture highlighted the need for a radical change in the development philosophy. He deprecated the philosophy of consumerism of the North which is being slavishly imitated by most countries of the South. "Judging by our action," he said, "our national objective seems to be to 'catch up with the North', and development seems to mean buying the most elaborate (technology) and the latest invention in every field, regardless of our capacity to pay for it, even to maintain it. Thus we have created a continuing dependency on the importation of technology and spare parts, which then requires us to produce for export regardless of our people's hunger and present needs".

Instead of defining development as the setting up of a 'modern' sector based on the consumerist philosophy of the North and the technology used to serve that philosophy, President Nyerere would rather define development as "provision of basic needs for all our people". Such a goal would not only reduce the misery of people's lives, but at the same time reduce dependence on the North. "For we shall be concentrating on the kind of economic production and investments which can be sustained by our own resources and our own capacity." Such a policy of national self-reliance would alone ensure the attainment of South-South self-reliance. (See *Mainstream*, February 27, 1982).

Unfortunately, President Nyerere's speech fell on deaf ears. Instead, Indira Gandhi's speech, more or less, set the tone of the deliberations. The dominant note in Indira Gandhi's speech was Unity of the South for strengthening its bargaining position vis-a-vis the North. Both Nyerere and Indira Gandhi emphasised the need for South-South unity; but one wanted it to attain a greater degree of self-reliance while the other wanted to extract more resources from the North. The nine points Indira Gandhi placed before the conference were all aimed at, and required for their implementation, more resources either from the North or from the oil-exporting countries. Indira Gandhi wanted the North and the oil-exporters to give more for the development of the South and she implored the South to achieve a greater degree of unity to obtain better terms from the North (See *Mainstream*, March 6, 1982). In contrast, President Nyerere wanted the South to change their development goal so that greater resource flow from the North would not be necessary. Nyerere's prescription required basic change in internal social and economic structure, while Indira Gandhi assumed these to be unalterable.

It is not difficult to understand why the call for unity to strengthen the bargaining position of the South roused more enthusiasm among the delegates than Nyerere's call for changing the development strategy and objectives. Most countries of the South are ruled by a type of bourgeoisie whose class interest has been deeply linked with the interests of the transnational corporations of the North. Since the colonial days these classes have been used by the foreign companies to extend their influence and their hold over the countries concerned. Even in countries like India where the bourgeoisie is very strong and has reached the monopoly stage, the link-up with foreign companies, is becoming more important for them today than ever before because of the technological dependence Nyerere talked about and because of the problem of internal market created by consumerist development.

It is natural, therefore, that the ruling circles in these countries would not to respond to a call for radical transformation of the economy, making the countries entirely independent of the North. They feel more happy if instead they are asked to unite in order to get a larger share of the surplus that is being taken away by the North. So long as the ruling classes in these countries have economic links with the foreign companies, their anti-imperialism is only half-hearted and is limited to obtaining a better share of the profit, more aid, more grants and loans at lower or no interest, better access to foreign markets, etc. Even in a country like India, where the people won their independence after a bitter struggle lasting over a century, the feeling against imperialism has become considerably lessened in recent years and collaboration with foreign firms is now regarded as a status symbol giving the indigenous companies prestige, greater solvency and better access to both internal and foreign markets. The social consequence of the change in values has resulted in greater penetration of American "culture" and the English language among the upper classes. The philosophy of con-

The author is a social scientist who formerly worked with the United Nations. He has also published a number of books on social science.

sumerism is taking deep root among the upper classes and this has enabled the upper classes to become more wealthy, more westernised and more consumerised in terms of Western luxury goods, while the vast majority of our people are becoming more and more deprived of even the essentials of life.

The rejection of the philosophy of production for satisfying basic needs and the adoption of consumerism as the basic development objective is an inevitable consequence of bourgeois domination over these countries. The representatives of these classes cannot be expected to adopt a philosophy of production of the basic needs for the people. For such a philosophy requires a production system in which investment is guided not by profitability but by social necessity. This in turn would require abolition or at least severe limitation of private property in capital. A system of production for basic needs and rule by the bourgeoisie cannot go together. No wonder, therefore, that President Nyerere's speech did not rouse any enthusiasm at the South-South Consultations.

It was taken for granted by the conference that the main task before it was to find the best way to negotiate with the North to extract more "concession", aid, loan and other facilities. If South-South self-reliance was ever talked about, it was primarily for presenting a united front at the negotiating table vis-a-vis the North. No wonder, therefore, that the various schemes of regional co-operation suggested in earlier international forums received only passing mention and no serious thought was given to them. For example, in all the four major areas that were raised before the meeting, namely, food, energy, trade and financial flow, the major solutions suggested depended on generous contributions from the North or the oil-exporting countries.

The Food Fund, already set up by the IMF, was suggested as the solution to meet the food scarcity of food deficit countries and the need to strengthen

which should not be ignored. It was this anti-imperialist element in it which enabled it to obtain the support of the developing countries. However feeble, and however great the betrayal by the leadership, it was a protest and an expression of indignation against the insults, injustices and exploitation perpetrated by the North on the South, which drew the support of the people. Moreover, the meeting provided a good forum where the imperialist countries could be exposed and the anti-imperialist consciousness of the people in the developing countries could be pushed up to a higher level. Thirdly, the labours of these meetings are not entirely fruitless; some of the schemes of regional and sub-regional co-operation formulated at these meetings are quite sound. If they are not implemented or are sabotaged by the transnational corporations, as commodity agreements often show, it is because of bourgeois domination over the countries concerned. With the elimination of bourgeois influence or its reduction, it is possible that these schemes will be implemented with success and bring considerable benefit to the participating countries. The Indian proposal placed before the meeting for mutual technological assistance is one that can help the participating countries achieve considerable self-reliance. In view of the strong tie-ups between the ruling classes in most of these countries and the transnational corporations of the North, it is likely that most countries of the South would rather seek the help of the transnational corporation than the help of such South-South organisations in the sphere of technology transfer.

Thus the dual nature of the South-South conferences need to be recognised. While the bourgeoisie uses these forums as a bargaining counter, their anti-imperialist content and the contribution they make in the struggle against imperialism should also be remembered.

It is also necessary to keep in mind the difference in the degree of anti-imperialism of the countries in the South in formulating any realistic scheme of

[redacted]

the effort of the imperialist countries to shift the burden to the South is intensified, the countries of the South become politically more conscious and realise the need to develop South-South self-reliance. If one compares the resolutions and speeches of such meetings over the years, one is struck by the increase in their militancy and the growing desire for South-South co-operation. This itself is a very significant contribution that these meetings have made towards the growth of anti-imperialism. It is likely that as their implorations get turned down more and more by the North, an increasing number of people in these countries will realise the futility of trying to catch up with the North and will join the movement for restructuring their economy and their society to make it more basic-need oriented. □

Making District Credit Plan Work

B.K. MUKHOPADHYAY

IN the present article an attempt is made to review the performance of District Credit Plans. While doing so special emphasis has been placed on the State of West Bengal.

Under the Lead Bank Scheme of the Reserve Bank of India, the concerned banks were called upon to prepare Credit Plans for each lead district after completing the fact-finding surveys in those districts. Since the Credit Plans for the three-year period 1980-82 are now being formulated and implemented according to the new guidelines issued by the RBI, a review of the implementation of earlier DCPs has become essential for the purpose of making the new DCPs more effective, as this will help eliminate the shortcomings noticed in the course of formulation and implementation of the existing DCPs.

The objectives of such a study may be enumerated broadly as follows: (i) to find out the reasons for divergence, if any, between planned targets and actual performance; (ii) to examine the extent to which conscious efforts were made by the participating institutions in the district, with special emphasis on the extension of agricultural credit; (iii) to review the part played by the District Level Consultative Committee (DLCC) in coordinating and monitoring the performance under the Credit Plan; and (iv) to suggest measures in the light of findings related to the above in order to activate the implementation process.

Identification of factors responsible for deviations from planned targets has been done with separate reference to financing agriculture and allied activities sector, industry sector and service sector.

The reasons for shortfalls in the matter of extending loans to the agricultural sector (with reference to planned target) may be summarised as follows: (i) Inadequate progress in extension of irrigation facilities; (ii) growth of farm financing has been hit by inadequate distribution centres for agricultural inputs. Poor response from the agriculture Department with reference to implementation of planned programme was another factor; (iii) financial institutions, particularly co-operative banks, did not find it encouraging to extend farm loans mainly because of unsatisfactory repayment performance; repayment rate may be put around a paltry 20 per cent; (iv) location of bank branches has largely stood in the way of farmers going to the banks for getting loans: for the bankers, absence of proper land records and uncertainty about the 'patta' allotments made it difficult to extend loans: 'pattas' of persons whom banks have financed have been subsequently cancelled and transferred to some other persons; (v) credit absorption in the agricultural sector is low owing to poor adaptability techniques.

Financing of allied activities, particularly dairying and pisciculture, was inhibited by the shortage of veterinary experts in the villages. This implied that the veterinary certificates necessary for cattle insurance cannot be obtained by intending loanees. Difficulty was there in maintaining steady supply of fish spawn, fingerlings, etc.

Some developmental programmes have also faced certain special problems which, in turn, affected smooth implementation. For example, the SAHP (Special Animal Husbandry Programme) faced problems like: (a) difficulties in identification of loanees; (b) non-availability of heifers; and (c) unwillingness of entrepreneur to avail of loan for the scheme.

Moreover, financing of agricultural projects requires adequate supervision and proper extension work. The progress in farm financing has been limited because most of the banks do not have adequate manpower for undertaking these assignments.

In the industrial and service sectors the implementation process has been fair. Poor performance of banks may be ascribed to the inability of local entrepreneurs to run their units efficiently. Financial institutions have experienced considerable difficulty in the realisation of loans in respect of units operating in this sector and they have also failed to find out suitable entrepreneurs in the district. Some other reasons may be put forward in this connection: (i) problem of input procurement; (ii) infrastructural bottlenecks; and (iii) problem of marketing.

The District Industries Centre (DIC) has come into existence replacing the erstwhile Rural Industries Project. The DIC is supposed to supply all sorts of facilities required by an entrepreneur operating in the industrial sector. But the DIC is still in its infancy. Some of the schemes the DIC have recommended to the banks have been found to be not very practical. The huge amount to be invested should be backed by marketing facilities, etc. On an experimental basis, schemes involving lesser loan component could be tried. Functionally, the DIC acts as a recommending agency instead of operating in close association with the banks in matters like loan extension, loan recovery, etc.

Unhealthy competition among commercial banks has also affected implementation. Shortage of manpower at branch level has affected to some extent work like quicker loan disbursement, post-loan supervision, etc. DRI financing was affected by follow-up constraints and the scattered nature of settlements. In some cases recovery was only 2 per cent of the DRI advances, mainly owing to poor post-loan supervision, mainly due to shortage of manpower. Difficulty is faced in matters like keeping track of the large number of loanee accounts, etc.

Infrastructural inadequacy, in particular, has affected implementation of DCPs. The entire district is virtually devoid of railway connections. The railway network touches only a few of the growth centres. Poor supply of electricity has affected production tempo in the industrial and service sectors. Energization, of pumps required for irrigation has also suffered. Also, little effort has been made to encourage units that can run without power or with little power supply.

Diversion of production loans for consumption purposes is another factor observed.

Finally, the poor state of repayment of loans has stood in the way of advances to all sectors of the district economy. This unsatisfactory repayment position has made banks shy of providing credit to agriculture. Direct lending to this sector, however, is found to be comparatively less risky. The repayment position of most of the existing fishery loans is not also satisfactory, not to speak of the case of transport operators. Institution-wise, commercial banks have been able to recover loans better than co-operative banks. Again, recovery of loans is not uniform throughout the district. The result is that fresh disbursement has been affected. Recycling of fund, which is vital for conducting successful banking business, has thus not taken place satisfactorily.

The District Level Consultative Committee was formed to bring about better understanding cohesion and co-ordination among bankers and financial institutions, Government and other functionaries involved in the implementation of various development programmes. Co-ordinated effort by different functionaries for timely and successful implementation of the DCP was aimed at. In many districts the DLCC has been found to play an active role in many respects. It has been able to involve different development agencies in DCP formulation implementation. It has also been involved in making periodical review of progress in implementation and has strengthened co-ordination among different agencies.

However, at times, the decisions at the DLCC meeting have either not been given full effect to or have taken a long time to materialise. One instance can be cited. Although it was decided that fitness/clearance certificate would be issued to vehicle owners only after they had obtained clearance certificates from the credit institutions (in order to reinforce the loan recovery drive), the decision was acted upon by the concerned Government departments after a long time. In some cases, again, the monitoring system of the DLCC has not been adequate. Mention may be made of inadequate and irregular supply of statistical data/information necessary for monitoring such a time-bound target-oriented programme (submission of completed Gutta Committee format, etc.).

The plan indicates sectoral as well as geographical spread of credit to be disbursed by different financial institutions operating during the three-year plan period. It has adopted a methodology under which the financial institutions and other development agencies were called upon to submit socio-economic data with reference to their respective command areas according to the format suggested by the banks.

An impression prevails that all the discrepancies cannot be fully explained by the divergence in the level of infrastructural development. This is owing to the fact that the assessment of credit need done in some of the DCPs ultimately proved to be not quite practical. Spatial variations in levels of development were not fully reflected. Again, some of the figures used for preparing block profiles are found to be erratic and not methodical.

The process of DCP formulation has been found to suffer from the absence of exercises related to resource use (physical as well as human), Moreover, although the DCP has been divided into anchalwise targets, linkage was inadequate between the credit plan on the one hand and the performance budgets of the individual branches of the banks operating in the district on the other. This may be taken as one of the reasons why bank personnel at branch level were often not very much aware of the DCP. In many cases branch-wise allocation of overall targets were not prepared and sent to the branches. Moreover, targets were separately fixed according to the nature of the branch (urban, semi-urban, rural), nor was the factor of 'age of the branch' considered for fixing targets.

For effective implementation of the DCP there exists the crucial requirement of active involvement of all development organisations—financial and non-financial. Cooperation among various agencies has been found to be of a commendable order at the district level. But at the sub-divisional, block anchal or village level, the necessary coordination has not always been there. This has been felt particularly in the field of realisation of overdues. The credit agencies complain of inadequate co-operation from Government agencies in matters like loan realisation. Government officials share the view that bankers generally place less stress on post-advance supervision, which leads to non-realisation.

Public participation is a must for the success of any development programme, particularly in a backward district where there is low absorption of credit. What is found to be true in most districts is that banks have formulated schemes for entrepreneures in the small-scale sector but only a handful entrepreneurs in fact came forward to make use of the same. In some cases even a sanctioned loan was not finally utilised by the party.

Government officials pointed out that rigidity in norms of lending, procedural paraphernalia and lack of proper follow-up measures on the part of the financial institutions, particularly commercial banks, acted as bottlenecks in the process of gearing up development in the rural areas. Lack of clear demarcation of operational areas among the financing agencies has also caused a problem in extending credit both spatially and functionally.

Implementation has also been slowed down owing to inadequate attention to the execution of special programmes such as Comprehensive Area Development Programme (CADP), erstwhile Small Farmers' Development Agency (SFDA), Fish Farmers Development Agency (FFDA), State Animal Husbandry Programme (SAHP), etc. For example, the pace at which FFDA's programme has moved is not very encouraging. SAHP has hardly been able to effectively involve bankers in the implementation process.

Micro-level planning has been getting importance in India in recent times. District is more an administrative unit than an economic unit. That is why the credit plan should have its origin at micro-level from the blocks. What is required is study of resource endowment and potential for growth of each block. This will help in formulating a rolling credit plan in tune with the changed planning pattern at Government level. This DCP has considered the block as a unit in planning. This is a good beginning, but formulation of block-level schemes with due consideration of the available and latent resources of the region is a must. Demarcation of area of operations (institution-wise) is another point to be considered seriously.

Identification of growth centres is a must, from credit disbursal point of view. Limited resources spread over a wide area will never generate backward and forward linkages. Credit advance on clusterbasis should be considered. A systematic approach of village adoption will solve the problem of multiplicity of agencies. Borrowers will also gain knowledge of the financial institution which is to be approached for credit. Village adoption would be less complicated if the subsidy reaches in time in the case of programmes subsidised by the Government.

Additional employment should be the criterion for sanctioning assistance for expansion of existing large and medium-scale industrial units. Big industrial projects may be located in locations with resources so that ancillary units can come up in the next phase. A thorough study of the size and character of unemployment is necessary to create a sufficient number of job opportunities.

Schemes for financing dairies, cottage tanneries, handlooms, poultry farming, etc, will help create jobs for agriculturists as well as educated persons. Financing a scheme of purchasing sewing machines will help create employment opportunities for women. Similarly, schemes for financing autorickshaws and trucks will add to employment generation. Household industries, self-employment of rural artisans under DRDA and DIC should be extended to cover all blocks. Local works need to be taken up, like major and minor irrigation, water supply, rural roads, village forests and pasture development. Construction of field channels, land levelling and provision of inputs for introduction of high-yielding varieties should be accelerated, along with activities like soil conservation and land reclamation. Labour-intensive activities like brick-making, garment-making, handlooms, powerlooms, furniture and toy-making will open new vistas of employment.

Banks and co-operatives should earmark specific amounts to meet the requirements of allottees of surplus land and Government waste land and to all categories of SC/ST taking up owner-cultivation for the first time. Improved methods of cultivation, when supported by the timely supply of package of inputs, would pave the way for more effective labour utilisation. Irrigation facilities would enhance employment by increasing the intensity of labour use for most crops. A change in cropping pattern results, which in turn increases labour employed per crop.

In the cottage and small-scale sectors the need is for co-ordinated action. District Industries Centres have to come up in a more systematic way. Training for improving existing skills of artisans as well as developing new skills should be looked into. Price support and special incentives for marketing need to be designed. Schemes should be selected in such a manner that employment-investment ratio becomes higher. Traditional activities need to be churned up. Pottery, mat-making, sweater manufacture, initial leather curing, etc. should get priority. Technical know-how should percolate more and more so that the drive for new entrepreneurship moves at a greater pace.□

Uncertainty in Bangladesh

PARTHA S. GHOSH

BANGLADESH politics is again in a flux. Those who heaved a sigh of relief at the dispersing of the cloud that hovered around the recent Cabinet reshuffle are having second thoughts. The clouds are still looming on the political horizon, and if the recent anti-Indian activities in Dacca are any indication, they may burst any day. The ever-growing rift within the ruling Bangladesh Nationalist Party (BNP) and the increasing discontent of the armed forces with the political process — a phenomenon which has become an integral part of Bangladesh politics — carry dangerous portents for political destabilisation. No wonder if the country is soon pushed back to the square one situation of uncertainty that had followed Mujibur Rahman's assassination in August 1975.

A part of the present malady is ascribable to the Constitution of Bangladesh itself. The peculiar mixture of vital elements of presidential and parliamentary forms of government which it provides can hardly bring permanence to any government. Conflict for power is inherent. The Constitution in the present form can work only in a situation when the President commends the loyalty of an overwhelming majority expressed not merely through ballot but also through a long record of habitual affection (like that for Mahatma Gandhi in India, Julius Nyerere in Tanzania or Charles de Gaulle in France). Abdus Sattar cannot of course claim to enjoy such a position. To ascribe the present malady to a document called the Constitution, however, is unrealistic. The Constitution of any country is always the result of the existing political situation and not *vice versa*. Thus, if the Constitution of Bangladesh provides for a complicated system, it is the politics of the country which is to blame and not the other way round.

Bangladesh is being ruled at present by a delicately balanced triarchy consisting of the President, Parliament and the Army whose respective influence, power, legitimacy, role and everything else one can find in the lexicon of political stability, are yet to be defined beyond controversy. Naturally, there are under-currents of power struggle in which each of the units has its own justification to consider itself more suited to govern than the other two.

Ever since the liberation of Bangladesh, two elements have plagued the country's political life; the internal rifts within political parties making the growth of a healthy party system difficult, and the role of the army in politics. But the two cannot be seen separately, for each gets sustenance from the other.

Squabbles in Bangladesh political parties — ruling as well as opposition — are too rampant to allow a stable government. This has resulted in ever-increasing politicisation of the military or, more appropriately, the militarisation of politics. The army has understood the inherent impotence of civilian power, and this had made it meddle with the Government as a matter of right.

This phenomenon, however, has origin in the freedom struggle itself. In the aftermath of the liberation war, Bangladeshis were at a loss to make out who deserved their loyalty — the leader (Mujib) or the institution (military). Things could have been settled down and stable civilian rule established had the politicians who became the rulers provided a reasonably honest and welfare-oriented government instead of devoting most of their energies to self-aggrandisement and indulging in intrigues This dismal state of political affairs, coupled with the undermining of the political system through rigged elections made the military assume a role which a democracy cannot afford to permit.

Zia-ur Rahman, owing to his military background and political ambitions, tried to strike a balance between the two incompatible forces — the desire of the military to have a share in the affairs of the country and the general longing of the Bangladeshis for democratic values and institutions like elections, Parliament, etc. He tried to restructure the army administration with the object of diffusing the power of the military. His strategy was to see to it that the military worked in cooperation with para-military forces like Ansars, Bangladesh Rifles, Combat Police Force and Village Defence Parties. He also sought to cushion the disaffection of the junior officers by increasing promotional avenues. All these strategies were directed to curb clandestine factionalism and groupism resulting from ideological conflict which had a tendency to tempt ambitious army officers to hatch adventurist plots to grab political power.

Having reduced the possibility of a military challenge to his rule, Zia sought to manipulate the political process to his advantage by taking recourse to a tricky strategy. He got elected into the Bangladesh National Assembly a vast number of informers of his erstwhile military regime. It is reported that as many as about 30 per cent of the elected representatives of the Assembly were in this category. Such a strategy was supposed to ensure him political support, besides providing an active channel of communication with the military. That Zia's experiment failed to accomplish what was desired need not be emphasised.

The power and influence of the army in Bangladesh politics is as real as Bangladesh itself. Sattar finds it difficult to reconcile this to his position as an elected representative of the masses. Ever since his election as President, there has been an undercurrent of tussle between him and the army chief,

Dr. Ghosh is Visiting Fellow at the Centre for Policy Research, New Delhi.

General Ershad. But in this game Sattar appears to be at the losing end.

In the beginning, emboldened by the massive popular mandate, Sattar had hoped to cut the military's influence to size. But as soon as he started advertising his popular base, General Ershad issued a press statement in defiance of the Presidency and went to the extent of advising the soldiers not to remain silent spectators.

Ever since, it has been a record of the army's systematic encroachment in the governance of the country. It won a major battle when it forced the President to reconstitute the National Security Council on its own terms. In the last week of December 1981, Sattar had replaced the National Defence Council (NDC) by a National Security Council (NSC) to consist of a chairman and nine members. While the President was to be the Chairman, the Vice-President, the Prime Minister, the Ministers in charge of Foreign Affairs, Industry, Finance and Home, and the three Chiefs of Staff (Army, Navy and Air Force) were to be the members. The Army strongly protested against the inclusion of ministers, including the Prime Minister, in the NSC. That this protest could not be overlooked is evident from the fact that on February 2, 1982, only a month after its formation, the membership of the NSC was slashed from ten to six. Actually, the President was browbeaten by Ershad to take the decision. When newsmen asked him what the army had in mind as their next step if their demands were not acceded to, the General is reported to have replied in a way which could mean much more than the exact words: "You will come to know of it in proper time."

The NSC now consists of the President, the Vice-President, the Prime Minister and the three Chiefs of Army, Navy and Air Force. Considering the fact that the NSC is supposed to assist and advise the Governments on all matters relating to national security as a whole, one can easily gauge the influance the military would wield in the governance of the country.

Probably Sattar has come to realise that discretion is the better part of valour and has accordingly started pampering the army. He is aware that he lacks, unlike Zia, a military clout which could have provided him some kind of in-built support from people in uniform. His reported prior consultation with the Chiefs of the armed forces while dissolving his Cabinet recently can be seen in this light. He has more than once lauded the armed forces for their role in the socio-economic development of Bangladesh.

President Sattar knows that he is sitting on a volcano. The BNP is faction-ridden and making it difficult for the Government to implement its policies. On the economic front, the country is facing a serious crisis. There are reports of the IMF putting pressure on the Government to devalue the *taka* by 30 per cent. The unsound financial situation had impelled the Government to reduce drastically the outlay of the Second Five-Year Plan from *taka* 25,595 crores to *taka* 18,000 crores. On the food front, the situation is precarious. It would not be surprising if famine hits Bangladesh during the coming summer. According to an official estimate, there is a shortfall of 2.8 million tons of foodgrains while the Government has been able to procure through imports only 1.55 million tons. Food price is rising by leaps and bounds. In the first week of February, the Dacca rice market registered a rise of *taka* 40 per maund in two days. Of course, part of this rise was attributable to panic buying.

Other social indicators also presage a grim future. The law and order situation is bad. Crime is increasing steadily. According to an estimate, during the first eleven months of last year, 1754 murders, 1809 dacoities, 1173 robberies and 7815 cases of rioting took place. The country's judicial system is crumbling. Reportedly, there are 3.5 million cases pending in law courts, many for years. The time-tested device of engaging the youth in futile education by indiscriminately opening the gates of colleges and universities, is also giving way. About 31,500 students sought admission in Dacca University this year against a total number of 2,500 seats.

Considering the dismal state of affairs, probably one can give the benefit of doubt to Sattar. Perhaps he is well-meaning and is actually interested in bringing about reforms. There could be reasons to believe that in the face of serious internal rift in the ruling BNP, he is finding it difficult to implement his policies. The dissidents in the party, who are not small in number, have launched a relentless campaign against the Prime Minister, Shah Azizur Rahman. Sattar's election as chairman of the party in January 1982, which it was hoped would put an end to intra-party rivalries, has failed to do so. To get rid of these political tangles and enforce his rule with determination and vigour, Sattar seems to have found it expedient to enlist military support.

It would be interesting to watch how Sattar reconciles the problem of political stability with that of social justice. The pro-Pakistani Islamic fundamentalist forces have already raised their heads, as is evident from recent anti-Indian activities in Dacca. Sattar increasingly finds it difficult to accommodate the views of these elements in his so-called drive for reform. In the given situation, he may be forced to choose to strengthen his alliance with the army. To what extent that alliance would be conducive to social justice is a moot point, for theoretically they are incompatible. The element of factionalism within the army further complicates matters. There are reports of serious challenges to General Ershad's leadership. The exoneration of Khondakar Mushtaq Ahmed, who engineered the assassination of Sheikh Mujib, has added another complicated variable in the political goings-on in Dacca. He enjoys the full confidence of Prime Minister Rahman (actually the Prime Minister manipulated the lifting of criminal charges against Khondakar Mushtaq Ahmed) who is reportedly getting ready for a showdown with Ershad.

In sum, Bangladesh presents a grotesque picture of internal squabbles, intrigues and personal ambitions where the rules of the political game will probably be honoured more in the breach. A serious political crisis is in the making.☐

Israel and American Left

CHRISTOPHER HITCHENS

Israel has long had a role in US politics and foreign policy postures. In this article the author describes how parochial conceptions of Israeli interest have swung a large body of American liberal opinion to the Right — particularly on foreign policy issues — and the impact of this on the Left. The article is reproduced with due acknowledgement from *The Nation* **of New York (December 5, 1981). The relevant issue of the journal was received late but the facts and arguments in the article remain valid.** Editor.

At the moment, the United States is governed by an Administration that indulges Israeli extremism on the West Bank of the Jordan River, and that supports anti-Jewish extremism in South America and South Africa and Saudi Arabia. To call this a paradox would be an over-statement. What is striking is that leading intellectuals are prepared to support the government on the second count because they sympathise with it on the first.

This article will try to deal with the effect of the Middle East conflict on American liberals. It will thus, necessarily, be an article largely about Jews. There was a time when Israel was accepted by most liberals as a democratic state with many socialist features and as embodying an affirmative victory over the dark racial prejudices that in many ways participated its birth. Today, when Israel puts itself forward as a sturdy ally in the cold war and and a reliable bridge-head against Arab and Iranian ferment, there has been a certain, how shall we say —, coarsening of the Zionist position. If Israel has become the natural friend of the overdogs in America and elsewhere, will this not have a consequence or two for liberal Jews and thus for American liberalism? A limited but significant number of commentators have already answered "yes" to this question, and striven to win over doubting liberals to a new pole on the right.

It is impossible to reduce the complexity of the argument to a single example. Still, two slight anecdotes from the contemporary scene may help to sketch an introduction.

In June of this year, liberal circles in New York City were briefly but noticeably convulsed by an exchange in *The Village Voice*. Jack Newfield, a grizzled foot-soldier in the stage-army of the good, accused his colleague Alexander Cockburn of concealing anti-Semitic attitudes beneath a facile anti-Zionism. Newfield's article, though clumsily written and argued, bore all the symptoms of a long-pent-up misgiving about socialist attitudes toward Israel and Zionism. But it did not, or could not, confine itself to the Middle East. It accused Cockburn of being a closet Stalinist and "anti-West".

Some months after that suggestive exchange, President Ronald Reagan cracked enough fingers and femurs to get his Awacs deal past the Senate. On the night of the vote, ABC's *Nightline* features a three-way debate between Faisal Al-Hegelan, the Saudi ambassador to the United States, Yitzhak Rabin, former Prime Minister of Israel, and Richard Allen, Reagan's ultra-reactionary (and pro-Menachem Begin) National Security Adviser. Since the Saudi ambassador was almost incoherent with self-satisfaction, it came down to Rabin versus Allen. Why, Allen was asked, had America abandoned its written pledge to eschew sales of strategic arms to the Arab world?

Well, he replied, the situation had changed. Iran was in chaos, Ethiopia didn't look too friendly, Libya seemed positively menacing. Anwar el-Sadat had been slain. A certain notorious superpower stood by ready to exploit these distressing developments. So, what Saudi wanted, Saudi was going to get (and no nonsense, by the by, about *them* recognising Israel's right to exist). Rabin sat through this with an air of distinct discomfort. Weren't those *Israel's* hardware arguments he was hearing? Wasn't it just that reasoning that had impelled him, when he was Israel's ambassador to Washington, to urge American Jews to vote for Richard Nixon in 1972? Had'nt Israel stood by Haile Selassie and the Shah until the last ditch? Allen's proposition that a percieved threat implies the promiscuous armament of the nearest "bulkwark" may seem like a non sequitur anyway (it is). But to Rabin, and to some others, it only sounds like a non sequitur when it isn't being applied to Israel. The best the former ambassador and Prime Minister could do was to threaten faintly that Israel might keep the Sinai. All in all, it was not an auspicious evening for Israeli "social democracy."

This is not the first time that Israel's policy has yielded unlooked-for results. In the 1950s, Israel became an ally of British and French colonial policy. It supported the French Government's murderous repression in Algeria. It was a junior partner in the 1956 Suez crisis provoked by Britain and France. It shared "intelligence" and military information with Paris and London in a common front against Arab nationalism. This had two effects (beyond speeding the farcical collapse of British and French influence). It isolated those in Israel who sought a *modus vivendi* with the Arabs. And it compromised Jews on the British and French Left while strengthening the hand of conservative forces. So long as loyalty to Israel was an issue in the conflict, there were many people who felt that the Anglo-French colonial policy could not be criticised quite as it deserved. Though, as ever, Jewish radicals were in the forefront of protest, there were many others, Jews and non-Jews, who were fatally ambivalent.

The French Socialist Party took decades to recover.

Both of these features are present in the current and continuing argument is America. And so is a third one, though its outlines can only just be discerned. Once the French Right had no further use for Israeli support, it moved back to a more traditional position. As soon as Iraq became a better customer and partner than Israel, there was what might politely be called a "tilt" that direction. And when Israel protested at this poor return on friendship, many in the salons of Paris were overheard to say that that was the trouble with Jews. There will come a time when the American Right, for all its unwelcome support for Israel's current settlement policy in Palestine, decides in its turn to support Israel as the rope supports the hanging man.

(Sadly, the Israeli establishment has seen this point and drawn the wrong conclusion from it. It is common to hear Israeli spokesmen justify their hard line by saying that they do not wish to be abandoned "like South Vietnam or Taiwan." By appealing for support as an encircled and embattled state, Israel has moved toward psychological identification with the pariah community. Hence some of its less palatable alliances in the Third World.)

The future attitude of the Right toward Israel is, strictly speaking, outside the scope of this article. I want to propose that the evolution of Israel into a colonial and military power has already placed American liberals in a very ambivalent and uncomfortable spot. I hope we may take it for granted that, as Irving Howe and Bernard Rosenberg put it a few years ago in an essay in *The New Conservatives* (New American Library):

> The overwhelming thrust of Jewish thought and writing in America these past several decades has been liberal, notably more so than in the population at large; and whatever radicalism we have had in America has found disproportionate support among Jews.

For the sake of symmetry, let me add the natural corollary Howe and Rosenberg made:

> It is hardly a secret that the number of Jews active in liberal, protest, radical and civil libertarian movements is highly disproportionate.

The Howe-Rosenberg essay, which makes a convenient point of entry to the argument, was titled "Are American Jews Turning to the Right?" In answer, it gave a much qualified "not necessarily." It stressed racial factors and the undeniable improvement of the socio-economic position of Jews in the United States. It gave some attention to the evolution of *Commentary* magazine under the stewardship of Norman Podhoretz (concluding that his mounting attacks on the Left did not yet amount to a neo-conservative position), and it emphasised the security and the prosperity of American Jews.

Howe and Rosenberg fairly concluded that there had been no general Right-ward shift among Jews. What they did *not* do, except in the most tentative manner, was to scrutinise the influence of Israel in shaping the answers to their crucial original question. When the authors did do this, they preferred to stress ideological and even psychological factors. Discussing the predicament of Jews, they wrote:

> Black antagonism ... is linked in their minds with global anti-Semitism and the enmity of Arabs toward Israel. Personal fright on the streets, poor public schools, a meritocracy in decline — all merge *psychically* with the precariousness of Israel and the mortification of Soviet Jewry. Who can easily separate in such reactions the warranted concern from the "paranoid" excess? (Emphasis added).

This approaches the root of the matter. Since the days of Hubert Humphrey there has been a measurable decline in the Jewish vote for liberal causes and positions. But this decline has not been as sharp as Milton Himmelfarb's electoral analysis in *Commentary* would have us believe. Nor is it traceable to any one issue. Rather there is a certain nexus of emotions involved — very much like those described by Howe and Rosenberg. Clearly, the question of Israel is near the heart of this confusion, and if the Left fails to recognise it, the Right does not.

The furthest that Howe and Rosenberg would go in this direction was to state, cautiously:

> Yet the *paradox* that must be recognised is that insofar as Israel functions — must function — as a state dealing with other states, its impact upon American Jews is — perhaps must be — conservative. (Emphasis added).

Note the throat-clearing and the conditional in that thoughtful sentence. The key word is "paradox." I want to argue that, increasingly, there is nothing *paradoxical* about positions that favour Israel's policies and are highly conservative; that there is now a better "fit" between Zionism* and conservatism than ever before, and that this has exacted a high price from the American liberal coalition. Irving Kristol once wrote, crassly, that a neo-conservative was a liberal who had been mugged by reality. I would not wish to borrow his pseudo-intellectual method. But, as one of the hired pens of the New Right and the Reagan Administration, he has hit on the ghost of a point. Many of those who have moved rightward are former liberal Zionists disturbed by the resentment of ghetto dwellers and repelled by the Third World attitude toward Israel.

Let me define what I mean by the use of a counter-example. Writing in *Commentray* almost two years ago, Midge Decter packed the whole problem into fifty words:

> In a world full of ambiguities and puzzlements, one thing is absolutely easy both to define and locate: that is the Jewish interest. The continued security and, in those happy places where the word applies — well-being of Jews, world-wide, rests with a strong, vital, prosperous, self-condident United States.

This is question-begging on a Homeric scale. "Security" is of course a well-known code-ward. (Is Israel more or less secure for holding Arab territory?) And we all know what some people mean by a "strong" United States. But the idea that the issue is an "easy" one, devoid of ambiguities and puzzlements, is breathtaking. In order to minimize misunderstanding, I state my own position, which is that the problem is highly complex and sensitive. And that Jewish security and well-being depends, perhaps rather more than other people's, on the defeat of chauvinism everywhere. And that the Israeli ruling establishment, both the Labour and the Likud parties, has moved away from this position. And that those in the United States who call themselves Zionists have, as a consequence, wavered in their traditional allegiances. Inevitably, this had led to confusion among liberals and intellectuals — a confusion that can only intensify as Israel becomes more conservative. The idea of Begin as an "aberration" used to be convenient as an escape clause, but it now lacks the crucial merit of plausibility.

---

*All shorthands are odious, but very few are dispensable. Some define "Zionism" as the end of exile and the ingathering of all Jews. Jacobo Timerman defines it as "the national liberation movement of the Jewish people." Most Arabs define it as a theory of racist colonisation. George Orwell said of it that it had "the usual characteristics of a nationalist movement, but the American version of it seems to be more violent and malignant than the British." Others on the Left have seen it, with varying degrees of enthusiasm, as the Jewish version of self-determination. I use it here to mean those who accept the rationale of Israel's actions as a state even when they disagree with some or many of its specific policies.

I have the impression that Howe has somewhat modified his own position to take account of this. In a recent interview with me, he said that "Israel has replaced liberalism as the secular religion of American Jews." This suggests, to put it no higher, that coexistence between the two commitments is becoming problematic.

Why should this not be the case? The Jewish people have the same right to a "state dealing with other states" as do any other people They have no less right to form opportunistic alliances, purchase weapons, impress neighbouring countries and suppress inconvenient minorities. There is no categorical reason to criticise Israeli policies any more than those of Iraq, the Philippines or China. What makes the argument bite hard on American life is the *real* paradox, unidentified either by Howe or by Podhoretz, that Jewish people in the Diaspora do have a general interest in resisting forces of bigotry and reaction, whereas, at least in the short term, the state of Israel does not. Indeed Israeli leaders have an occasional interest in actually *allying* with such forces. And, sad to say, many of the policies of that state — especially in the Third world and on the West Bank — positively *appeal* to those who do not normally care for Jews. Let me attempt to give a few recent and important examples.

Perhaps the first time that the realisation of such a collusion between Israel and the American Right occurred to a large number of people simultaneously was when then Ambassador Rabin exceeded his diplomatic status to urge that Jewish-Americans vote for Nixon. But in 1972, there were many to argue that he had made a slip — even if an emblematic one. Now, that view would be very much harder to defend. An episode that threw the issue of Israel and the Right into sharp relief took place in New York City in November 1980. It showed that uncritical attitudes toward Israel have a way of rebounding on Jewish interests. and on the liberal politics that were once inextricable from them. (Nixon's anti-Semitism is now better known than it was in 1972).

At a gala dinner for the centenary of Vladimir Zeev Jabotinsky, the Right-wing Ziqinst ideologue, Prime Minister Begin pinned a Jabotinsky medal — one of a very limited number to be conferred — on the swollen breast of the Rev. Jerry Falwell. Many liberal Jews, most notably Rabbi Alexander Schindler, were outraged by this brash endorsement and said so in public. Was it not Falwell's movement that had implied (or the least) that God was indifferent to the Jews? What was Begin, who if anything overstates the intimacy between Jews and Scripture, doing with this character? The Rabbi soon got his answer. Writing in the Jewish *Week-American Examiner*, Herbert Zweibon, Erich Isaac and Rael Jean Isaac were contemptuous of Schindler's soft-hearted caveat. Falwell's view of Jews or any other kind of American was not the point. What counted was his attitude toward Israel, and toward Zionism's American "friends."

They wrote of Falwell:

> Even apart from the vital issue of Israel, at this time there is a far greater communality of interests among Jews and the Moral Majority than there is among Jews and the National Council of Churches. An America with a strong family that fosters traditional values is far more likely to be a comfortable place for Jews than an America where no values are upheld.

This, of a man who forced even Roy Cohn onto the record with a denunciation of anti-Semitism! The objection to the National Council of Churches, by the way, was not to its presumed anti-family and anti-traditional stands so much as to its advocacy of "dialogue" with the PLO. So, better to cooperate with the most bigoted force in the country than with those who would share the Holy Land with its Arab inhabitants. Writing in *Commentary*, Seymour Martin Lipset and Earl Raab were hardly less complacement. They did not exult, as Podhorety had alreada done, about Jimmy Carter's failure to get a majority of the Jewish vote in 1980. But they were as tender as could be to Falwell. He was for instance, a great improvement on his frantically anti-Semitic predecessor, the "evangelist" Gerald Winrod.

Falwell, certainly, feels free to advise Israel and the Jews. He recently told *Jewish Press* magazine that "there is no question Judea and Samaria should be part of Israel", adding that the sooner the Golan Heights and Jerusalem were fully annexed as well, the better for all concerned. What is depressing is to find Lipset and Raab writing an unequivocal "QED" under all this garbage, as if to say, "If he is uncritical of Israel, how can he be a bigot?" Picture for a second what *Commentary* would print if anybody on the Left had spoken of the Jews as Falwell has done.

It's clearly on the Left that *Commentary* sees the threat to Jewish interests. In a boring symposium published in the magazine's January 1980 issue; the editors asked readers to reconsider "axiomatic" Jewish attachment to what they termed "the standard liberal agenda". The pretexts for doing so were illuminating:

> This axiom might seem to have been called into question by certain recent developments — the widespread support among liberals for quotas, the diminishing enthusiasm among liberals for the PLO, and the paucity of Liberal protest

against the anti-Semitism that surfaced in the wake of Andrew Young's resignation.

There are many striking aspects to the "question". (For one thing, how do you call an axiom into question? For another, how do you characterize the departure of Young from his post as a resignation"?) The first three ingredients or clauses restate the same point in different ways — loyalty to Israel is assumed to take precedence. The very last reflects back upon the very first. It is implied, as if it were pointless to debate the matter, that affirmative action is bad for all classes and sexes of Jews. This bold assertion is then juxtaposed, as if naturally enough, with waning liberal support for Israel. Tautology intervenes for a second to match sympathy for the PLO with hostility to Israel. Then we learn that Young is responsible not only for his own firing but for any prejudiced remarks that might have been made about it. Earlier I quoted Howe to the effect that subliminal and intuitive factors were important in perceptions like these, and I think that the editors of *Commentary* really have no choice but to agree.

As Prof. Bernard Avishai showed in a striking and incisive article in *Dissent* (Spring 1981), *Commentary's* neo-conservative politics will not help most American Jews one bit. And most Jewish intellectuals can survive spurious appeals to their emotions. They can see often more clearly than their Christian or secular counterparts, that Begin is a mediocre fanatic and that Falwell is a *lumden* demagogue. Yet there has been a certain reluctance to face these conclusions, and to reject the phony logic that has led to an alliance between the most vocal proponents of Zionism and the New Right.

As Howe and Rosenberg rightly said, Israel is a state. A state, moreover, that occupies and governs the territories of others — by right of conquest. Here is the root of the matter. It is impossible to find excuses for military rule without experiencing a certain coarsening — certain identification with the overdog. With at least a certain part of your mind, you see the world from the point of view of the policeman, the intelligence agent, the paid informer and (but it's true) even the torturer. You find that it's lonely being a cop, something that liberals don't understand. The intellectual ramifications of this are probably, in the medium and long term, incalculable. But among them are:

(1) The Third World changes shape. No longer a desperate and exploited area, it becomes minatory, arrogant, mob-like and greedy, impelled by a hatred of achievement and led by people who would rather shout than work. The best literacy analogue here is Saul Bellow, who managed to write a whole book on Jerusalem without meeting or alluding to an Arab and, in *Mr. Sammler's Planet*, seemed to have rehearsed this shudder of distate on the streets of New York. He has added his name to the rightist Committee for the Free World. From Today Kollek was Ed Koch Midge Decter? Think about it.

(2) Next, it becomes harder to criticise American foreign policy. Never mind which Arab royal house is the temporary favourite in Washington; Israel will depend upon, and act as executor of, a rugged and adventurous American posture. It will also be a major customer and laboratory for military equipment. At least you can be sure that Israel won't be an Islamic republic by next Thanksgiving. Those who put Israel first, therefore, must mute their criticisms of the arms trade and the Rapid Deployment Force. They must also subcontract their consciences when it comes to Israel's own arms trade — with Somoza before he was overthrown, with Duarte, with Botha and even with the anti-Semitic *caudillios* of Argentina. Once you make a fetish of "security", you will the means to the end.

(3) A related point. If there is one issue that still unifies liberal and radical disquiet, it is the spread of nuclear weaponry. Yet, in the one area of the world that needs such technology least, it has been Israel that has set the pace. There has been a certain lack of forthrightness among liberals on this point: a willingness to make allowances. But it was agreed by many liberals that Israel acted judiciously in blasting Iraq's nuclear reactor off the map. Note here the official Israeli justification — that an Iraqi bomb would be "a mortal threat to the Jewish people". Where in the Holy Land could a thermonuclear weapon explode without wiping out countless Arab Palestinians? I don't mean to say that Iraq might not run that risk. I mean to show up the sectarian nature of the Israelis' rationale, and the dismal way in which it was echoed by pro-Begin parrots in less exposed positions.

(4) Having reproved the Third World for its ungrateful and demogogic conduct, those formerly liberal figures who have swallowed their doubts about Begin are also berating Europe. In many of the articles that deplore the spread of "pacifism and neutralism" in Europe — or, if you prefer, the first stirrings of reluctance at the prospect of being expendable in the next war — one finds an apparently irrelevant paragraph. This paragraph attacks European governments for their role in the Middle East and their view that the PLO cannot be excluded forever from negotiations. Whatever the objection of this policy, it can hardly be on the ground of "pacifism and neutralism." A policy of "Israel first" leads quite speedily and smoothly to a policy of America first." Jews will not be the only ones to suffer if such a programme succeeds in global terms. And as for liberalism. ...

(5) Because the Soviet Union supports the Arab cause, and because it shamefully persecutes its Jews, it becomes harder to resist the conclusion that the "main enemy" is the USSR. This has opened a whole flank in the liberal community to doubts about detente and rearmament.

(6) Many Jews and many Israelis are secular, and support secular politics. Yet, as Israel falls more under the domination of the lugubrious orthodox parties, this consensus too comes under pressure. Rabbi Meir Kahane has the legal right to live in Hebron and carry a weapon. An Arab born there has neither right. This consequence of the Law of Return may be an unintended one. But, many American liberals only objected when Begin proposed to alter the law's definition of a Jew. Secular consistency, an important component of liberalism,

can only be harmed by double standards like these.

Can I substantiate any of these offensive assertions and innuendos? I believe I can. One particular political voyage has called in so many ideological ports as to be symbolic.

In 1967, Martin Peretz, now editor-in-chief of *The New Republic,* broke with his friends on the Left about Israel. Since then, he has made the PLO a touchstone issue.The cult of "anti-terrorism" has taken a sturdy hold on that once-proud magazine, and has spilled over from gung-ho attitudes on Israel to a pastiche of Reaganism in general — at least in foreign policy.

In discussion with me, Peretz has pointed out that his magazine criticizes Begin quite often. He has also argued (correctly) that in many cases a shift to a more conservative position *predates* an attachment to Zionism (cf. the justly forgotten *nouvelles philosophes* in France). Peretz certainly visualises his general political perspective as comparable to that of Daniel Patrick Moynihan — apparently tough abroad and seemingly tender at home. Such a stance leads to aggressiveness abroad and, at best, negligence at home. It melts into the zombie world of Carl Gershman and the Social Democrats USA, who act as coat-holders to Jeane Kirkpatrick, who in turn acts as valet to Reagan. And, when Kirkpatrick wishes to combine her new role as Government spokesman with her old job as reactionary pamphleteer, in whose pages does she receive hospitality? I'm afraid you saw this coming. Writing in *The New Republic* of November 11, Kirkpatrick could find nothing to criticise in the Reagan Administration's foreign policy except the faint possibility that it might treat with the PLO. I yield to anybody in my admiration of the lady, but I must thank her for a perfect statement of the Begin mentality and its international complexity:

> The PLO preaches a brand of Palestinian nationalism and radical politics that links the struggle for the destruction of Israel to El Salvador, Africa, the Middle East — *indeed, everywhere.*

The italics are mine. Perhaps they are otiose. *Indeed everywhere.* Only connect, says Kirkpatrick, and you will see that the vernacular of her Zionism commits you against revolution worldwide.

Peretz is not new to this line. He published pro-South African material from Arnaud de Borchgrave. He helped to start Claire Sterling's campaign on "the terror network." Constantine Menges, then a clown from the Hudson Institute and now a government full-timer on Central America, got his first serious airing in the pages of *The New Republic.* J.B. Kelly and Elie Kedourie, both of whom preach jihad against the Arab and Iranian world, have also been honoured guests in the magazine's pages. There is only one thing that this salad of persons has in common, and that is an unswerving commitment *contra mundum* to Israel's imagined interests. I do not, therefore, think that it is paranoiac to identify *The New Republic's* rightward lurch as largely a function of the Middle East conflict.

So, some small ironies in conclusion:

● In October, *The New Republic* published an endorsement of Mayor Koch's dismal re-election campagin in New York City. The magazine decried his black critics as "anti-Semitic." Among those who found this hard to take was *The Village Voice's* Newfield, who wrote a letter of protest and was smartly called to order by Peretz. Those who use guilt by association are seldom invulnerable.

● Kirkpatrick would perhaps not have written, and Peretz might not have published, such an overwrought piece unless she and he had at least suspected that the American Right would chivvy the Jews into the sea for a few petrodollars (as the French Right dumped Israel as soon as Iraq looked like a better bet). What return will Israel get for its role as a ditto to American foreign policy? More pertinently, what do American Jews and liberals stand to gain from being discreet on the point?

Kirkpatrick, Podhoretz, Kristol and the others were *at best* indifferent to the fate and (later) the revelations of Timerman, who now makes his home in Israel and cares for Zionism and the Jewish people not less than many who live elsewhere. He has stated that he sees his new country set on a course of fanaticism and disaster. I would be a hypocrite if I claimed to agree with Timerman on all points (the phrase "the Jewish Mediterranean" in his memoir seems to me especially insensitive as a description of the view from Tel Aviv), but he does remind us of an important fact. For many liberals, loyalty to Israely simply means loyalty to the Israeli Government. As I.F Stone has pointed out, dissent in Israel receives very little coverage in the United States. The substantial number of Israeli Jews who oppose their Government's policies of annexation and discrimination receive almost no encouragement from their better-placed counterparts. They are ignored, by *precisely* the same people who drone about Israel being pluralistic and democratic.

It would be a good thing if Israeli and American liberals saw more of one another. They might learn from common experience that nobody stands to gain from an alliance between the American Right and the most chauvinistic elements in Israel, and that euphemisms about "security" only serve to conceal the deadly errors that are being made in its name. The friends of the Jews are not Falwell and his Lynchburg ranters, nor the racist hooligans of Gush Emunim and the Jewish Defense League, nor the international arms dealers who shop both sides of the street, nor the schmaltx peddlers like Koch, nor the sunshine patriots like Podhoretz.

Howe's implied question still requires an answer. If it comes to a choice between Israeli policy and liberalism, which will American liberals choose? The choice has been put off for a long time, and many sincere people obviously would prefer to postpone it indefinitely. But, meanwhile, a small but significant part of the spectrum has chosen the first option and, thereby, consciously abandoned liberalism altogether. (Numbers here are not decisive: in Israel, extremists like Geula Cohen and Kahane have very few followers but have succeeded in creating a polarization favorable to the Right). If this sad division succeeds in reawakening the critical faculties of others, then the vital coalition of the Left might still be salvaged.□

Growth Possibilities in OECD Economies

An Alternative View—II

VIJAY LAXMAN KELKAR

FROM all this evidence it is possible to argue that the relatively lower growth rate of productivity in the services sector in face of output expansion has been a major cause of slowdown in the aggregate productivity growth and in the overall growth rate of the OECD economies. Such a consequence of differential productivity growth is not difficult to demonstrate through a rather straightforward algebra.[19]

At this stage it should be noted that the concept of productivity and its measurement in the services sector has a number of methodological problems. These problems compound when applied to non-market services which accounts for a major portion of the services sector. There is a growing awareness of those problems and attempts are being made to refiné a methodology for these measurements.[20]

One of the problems is that conventional measures tend to underestimate the productivity in the services sector. This problem can be particularly acute in the case of public services, non-market services. Of course, not all the sources of bias lead to under-estimation of productivity. For instance, it is possible that not all of the services inputs get accounted for as inputs in the services sector. In-company services such as accountants, legal departments of manufacturing concerns, etc., are included as inputs to the manufacturing sector. With these qualifications from the available evidence it is indeed possible to conclude that the services sector has experienced a relatively lower rate of producvity growth.

There are various reasons for the above phenomena. Firstly, this has been due to technological problems, that is, low capital intensity or a lower degree of mechanization of production and a lack of capital intensive technologies in this sector.[21] Georgescu-Rogen has identified production characteristics of the services sector as being a cause of the relatively greater "idleness" of factor inputs and hence a lower productivity in this sector.[22]

It can also be argued that unlike the commodity producing sectors where international trade has played an important role in promoting technology diffusion through international competitive pressures there was no such mechanism operating in the services sector as in this sector the share of international trade in much lower. According to a recent study the share of exports of services in the total exports of West European countries and of the US have been around only 10-12 per cent.[23] When one takes into account that the share in gross domestic product in these sectors is around 60 per cent, it is clear that the services sector as a whole is much less "open" in the sense of international trade. However, in our view, perhaps the most important reasons lie in the nature of the output of this sector, that is, the degree of "information" content in the output of the services sector which means that due to lack of technologies in "information processing" the possibilities of capital deepening were rather limited.

In a major study, the Economic Commission for Europe (ECE) has concluded that in the services sector capital intensity or capital input per labour input tends to be much lower compared to the other sectors, for example manufacturing. This study shows that in the decade of the seventies relative capital-labour ratios observed in the private services sector in major West European countries such as France, the Federal Republic of Germany, Great Britain, Sweden, etc., were only 35 to 60 per cent of the figures for the overall economy (1977). Yet another comparative study of capital per employee for a factory worker (manufacturing sector), and officer worker (services sector), shows, that in the US on an average capital investment per office worker is only 2,000 dollars compared to the factory sector average of 25,000 dollars per worker and 70,000 dollars of the agricultural sector[24]. A more recent study prepared by the OECD shows that in 1976 capital intensity in the private services sector is only about 50 per cent compared to the manufacturing sector (see Table IX). Interestingly, this table also suggests that the rate of growth of capital per employee during 1963-1976 may have been higher in the manufacturing sector compared to the private services sector. For instance, in the US, capital per employee in the manufacturing sector was 29,446 dollars in 1976 compared to only 19,053 dollars in 1963, while in the services sector even in 1976 capital per employee was 15,165 dollars while in 1963 it was 11,867 dollars.

The ECE study also looked at the question of whether any positive relationship exists between growth in productivity and growth in output in the services sector — to examine whether Verdoon's law also applies to the services sector. Interestingly, this study concludes that unlike the manufacturing sector, there is no evidence of positive relationship between output and growth in productivity in the services sector. One can only speculate on the reasons for this finding. Perhaps this only reflects

The author is Economic Adviser, Ministry of Commerce. He is, currently working as a Consultant to UNCTAD, Geneva. The views expressed in this article are the author's own. The first part of this article appeared in *Mainstream* last week (March 20, 1982), and this is the second and concluding part.

the lack of mechanisation in this sector, that is, relatively lower capital intensity of the production process.

The above data may have to be taken with some caution. There are measurement problems and these measures may not be strictly comparable. More appropriate measures may have to be drawn from the input/output tables. For instance, for the US the latest detailed input/output table is available for 1972. That table also gives data for the value added in each of the sectors. With the help of the corresponding sector-wise employment data it would be possible to work out more satisfactory indices for capital intensity. Such a measure was developed by H. Larry in his study of the labour intensity of manufactured exports from developing countries and this approach seems to be a feasible one. (*Imports of Manufactures from Developing Countries*, 1968). There seems little doubt that all available evidence captures the essential feature of the services sector, namely, a relatively lower degree of mechanization.

Perhaps the most important feature of services sector employment is that these occupations are predominantly information-related activities — involving either production or distribution of information. Recently, OECD has completed a series of rather pioneering studies through the information computer and communication working party of its Committee for Scientific Technological Policy (1981). The results of these studies are now available. These studies show that in the OECD economies on average the share of information-related occupations in total employment has increased at the rate of 3 per cent for every five-year period and now accounts for more than 33 per cent of the total labour force of OECD economies. More importantly, the studies have shown that 75 per cent of the total growth in information-related employment in the period 1960-1978 has been in the services sector. In other words, "information processing" is the key attribute of output of the services sector.

These OECD reports of expert groups have clearly shown that the phenomenal technological breakthrough in micro-electronics can dramatically influence the productivity of such information-processing activities. There are two important driving forces in this field of information technology: first, cost reductions due to micro-electronics; secondly, combination of computer and telecommunication systems — "Telematics". In other words, considerable possibilities now exist for increasing substitution of capital in these sectors and thus would rapidly increase the labour productivity of the sector that today is employing more than 60 per cent of the total labour force in advanced industrialised countries.

According to these studies, such possibilities exist in all sub-sector: it includes sub-sectors producing market services and non-market services. For instance, as seen from Table XI "Informational occupations" account for 40-45 per cent of the total labour force in the sub-sector trade and distribution while in the sub-sector finance and insurance the share of "information-related" occupation is as high as 80·90 per cent. Even in public administration and the transport sector the share of informational occupations is close to 50 per cent. Even simple occupations described as "routine information handling" occupations are now accounting for as high as 25 per cent of the total economically-active population in countries such as the US and Japan. In important public services sectors such as health, education, etc., which account for 66 per cent of the total government employment in West Europe, there are considerable possibilities for increasing productivity through these technological innovations.[25]

Table IX

CAPITAL PER EMPLOYEE: MANUFACTURING AND PRIVATE SERVICES, SELECTED COUNTRIES, 1963-1976(1)

US dollars

Country	*Manufacturing*		*Private services*	
	1963	*1976*	*1963*	*1976*
France	10,701	18,806	8,128	12,865

What we are arguing is that in future the lower growth in productivity of the services sector need not be a "drag" on the world economy as now through technical change and capital deepening it is possible to overcome the present low productivity. These possibilities are being increasingly recognised by a number of social scientists, policy-makers and labour union activists of the OECD countries.[26] They recognise that advances in micro-electronics technology is a fundamental and basic innovation and can have revolutionary consequences. An excellent report prepared by S. Nora and J. Minc for the President of France has pointed out the profound implications of this new technological change in all these dimensions — political, sociological, economic, etc. This report has among other things highlighted the productivity implications to the services sector.

At this stage it may be useful to quote one of these authors (J. Rada) in order to get some understanding of the nature of these technological innovations.

> "The recent developments just referred to are centred on the creation of integrated silicon microcircuits. These have acted as the catalyst in the synthesis of electronics, computing and telecommunications technologies. The raw material which these technologies have been developed to handle is information, and the collective name for this technological trinity is 'information technology' or 'telematics'.
>
> "The extraordinary significance of information technology has led some to compare it to the wheel, the steam engine and the mastering of electricity. These impressive claims are based on the technology's role in enabling information to be

Table X

INCREASES IN EMPLOYMENT IN INFORMATION-RELATED NON-MANUAL OCCUPATION: SELECTED COUNTRIES

Occupational grouping	*Country*	*Period*	*Absolute employment increase*	*Proportion due to:*		*Employment increase as a proportion of total employment increase*
			%	*Sectoral shifts (1)* %	*Others (2)* %	
Information related occupations	Germany	1950-1970	76	49-51	49-51	1.18
	Japan	1960-1070	70	53-65	35-47	0.66
	Sweden	1960-1975	47	48-54	46-52	1.30
	United Kingdom	1951-1971	48	42-50	58-50	1.18
Non-manual occupations	Australia	1961-1971	28	85-86	14-15	0.62
	Japan	1965-1977	44	81-85	15-19	1.15
	United States	1960-1970	31	82-85	15-18	0.68

(1) These figures are expressed as a range where the upper estimate is obtained using end year occupational proportions as weights and the lower estimate using base year weights. The difference between these is the inter-action term.
(2) In particular, increases in the occupational grouping's share of employment in each sector.

handled and processed quickly, economically and, most important of all, through a coherent system using a uniform signal, the electronic impulse ('bit'). The information handling capabilities of the technology have reached a point at which it can perform and extend a wide range of functions that were previously only within the reach of human intelligence".

This sector has been experiencing exponential growth in terms of cost reductions. According to the calculations of Kendrick the rate of growth of total factor productivity of this manufacturing sub-sector has been perhaps highest during recent years.[27] For instance, according to Kendrick in the US semi-conductor industry productivity has grown at a rate of 10 per cent per annum during recent years. This sector has also one other important characteristic: it is not energy-intensive.

These technologies would not only increase the productivity of the services sector but would also increase overall productivity in the manufacturing sector by (i) moving the structure of production of the manufacturing sector towards higher productivity sub-sectors, and (ii) by improving energy efficiency, as well as productivity of individual manufacturing processes. For instance, in 1979 an expert group of the West German Ministry of Research and Technology estimated that new information technology can lead to energy saving up to 38 per cent in road transportation and 15-20 per cent in energy consumption in the household sector. What all this shows is that these new micro-electronic-based technologies are fundamental and basic innovations in the "Schumpeterian" sense and that they will have an economy-wide impact, especially in the context of a sharp increase in the relative prices of energy, thus also helping in accelerating the energy transition of the OECD economies. In addition to micro-electronics, we are on the threshold of equally important breakthroughs especially in the field if bio-engineering, energy-related technologies and newer forms of energy[28]. All these innovations will only have an additional beneficial impact on the growth prospects.

After one takes into account all these factors — (i) increased labour productivity in the services sector, both market and non-market services; (ii) increased efficiency of manufacturing sector; (iii) improved energy efficiency due to, among other things, the introduction of micro-processors; and (iv) other major technological advances — it is clear that the growth rate of the OECD economies, with an appropriate policy mix, can be stepped up quite substantially. For illustrative purposes one can argue that if productivity in the services sector increases due to these new technologies at the same rate as obtained in the manufacturing sector in recent years, the overall growth rate of productivity of the OECD economies can even exceed those achieved in the years 1950 to 1970 — 4.5 per cent per annum — and thus can lead to GDP growth rates at an even higher level than 5.5 per cent.

The above discussion indicates possibilities for rapid growth provided the OECD economies follow a different kind of policy mix. This will call for different policy measures than those adopted at present. Here we will only briefly outline the elements of an alternative policy package. Clearly, in the new policy measures emphasis will have to be placed on up-dating the technology of the services sector and

Table XI

PERCENTAGES OF "ECONOMICALLY ACTIVE" IN "ROUTINE" (1) INFORMATION HANDLING OCCUATIONS

on restructuring the energy base through a massive public and private investment programme centring around more intensive utilisation of micro-electronics and new energy-efficient technologies. Equally, the macro-economic policy would have to manage the aggregate demand at much higher levels so that during the transition period involuntary unemployment levels are kept at a minimum. Such an expanded public investment and expenditure programme will have to substitute present public expenditures policies which are increasingly oriented towards armament expenditures.[29] In other words, a programme of disarmament will have to be an important element of this package. This will have the additional benefit of releasing technological resources in the form of trained scientists and engineers who are engaged in defence-related activities towards other areas, for example, improving energy-efficiency. In addition to the step-up of public investment, increased private investments in the form of new plants and equipment to modernise existing industries, for example, consumer durables, Industrial machinery, etc., will play an important role. Such a modernisation programme is now necessary as the existing capital stocks in many of the industries are becoming rapidly obsolete in face of much higher relative prices of energy. This would become one of the key determinants in the restructuring of world industry as brought out in the recent UNIDO survey (*World Industry in 1980*). M. Bailey in his recent analysis of US productivity has also shown that this issue is of considerable importance.[30]

In addition to the demand for investment goods or capital goods, consumer demand can also be stimulated by aiming at "modernisation" of consumer durables. In the post-War years buoyant consumer durables demand as well as investment goods demand played a crucial role in maintaining buoyant effective demand. For instance, the US economy saw a considerable shift in the privately-held asset structure during the post-War year. The share of consumer durables in total household wealth increased from 10 per cent in 1945 to 14.7 per cent in 1965 and to 17.6 per cent by 1973. Between 1945-1970 the stock of motor vehicles increased by 250 billion dollars out of the overall increase of consumer durables of 680 billion dollars.[31] It is being increasingly demonstrated that existing stocks of consumer durables, for example, automobiles, are not "efficient" given the new structure of energy prices. Interestingly, this is beginning to get reflected in the second half of the decade of the seventies when the share of automobiles in total durables did not show any increase. This could mean that the consumer demand for "new" types of consumer durables that are energy efficient can be stimulated. In other words, in the next wave of industrialisation or "re-industrialisation" consumer durables demand may play a role similar to the post-War years.

We are aware that we have only barely outlined the new policy package. However, we would like to take care of one of the possible objections. It can be argued that the proposed policy package could be inflationary. Before we look into this argument, a point needs to be made regarding a possible "excessive" obsession about inflation. There are groups of countries where inflation has had no adverse impact on capital accumulation and rate of growth in the economy. For instance, in many of the large Latin American countries during the last decade there has been considerable economic expansion in an environment of rising prices. Admittedly, this question is a complex one as it has implications, among other things, for income distribution, employment, etc. But this does raise a legitimate doubt about macro-economic objectives where control of inflation has maximum weight. In any case, proposed investment programmes will in fact reduce the inflationary pressure in the OECD economies. In our view a major source of the present inflationary pressure is relatively slower increase in the productivity of "sheltered" sectors (services sector). This is because in the OECD economies wages tend to get determined in the "exposed sectors" with a high productivity growth (manufacturing sector) and these get transmitted to other sectors where productivity may not increase at the same pace and thus bring pressures on aggregate demand and investible resources. This is the essence of the "structural" type model of inflation developed by the Scandinavian economists applicable to small open economies.[32] With some modifications, such a model would capture the inflationary process of other OECD economies. In such a case, an improvement in the productivity of the services sector ("sheltered" sectors) would then remove the present inflationary bias and can lead these economies to non-inflationary growth.

Admittedly, there are other important "structural" factors in explaining the present inflationary process in the advanced industrialised countries. For instance, the growing concentration in various sectors and consequently increased oligopolistic power of transnationals is playing an important role in sustained upward pressure on prices. Equally, the increasing role of transnational banks in the expansion of international liquidity would have the consequence of accommodating higher rates of inflation. Hence, for a fuller theory of inflation one will have to take into account these and other important structural aspects.

We are quite aware that the new policy package would encompass important political and sociological issues such as attitudes about leisure, working time, quality of life, participation of the working class in technological change, etc. After all, the problems involved are not only economic. They are a part of much broader issues, namely, the long-term goals of these societies. It is not difficult to see that some of the major implications of the new technologies would be: (i) shift of employment from the present services to manufacturing and "new" services; (ii) increased availability of leisure; and (iii) qualitative change in the concept of work, etc. These changes have wide-ranging sociological and political implications. Hence, there is no doubt that activisation of a political process that would demand such a transition is really the heart of the matter. What is being argued here is that there are now possibilities of pursuing appropriate policy-mixes which, along with new technologies, can make such a transition smoother.

There is an additional point. In order to ensure that such an acceleration in growth rates is successful, it will have to be implemented in a coordinated manner, that is, by international coordination of national economic policies. This has become essential for two reasons: (i) growing inter-penetration of the OECD economies which has led to a greater integration of the product markets as well as of the factor markets; and (ii) "multipolar" nature of OECD economies, that is, breakdown of the hegemony of one single economic power over the international economy. For instance, the gross domestic product of Japan and the EEC together now exceeds that of the US. The consequent breakdown of the international economy is perhaps most vividly reflected in the current instability of the international monetary system. In the background of these profound changes in the structure of international capitalism compared to the early post-War years, there is no doubt that a new development paradigm is required where increased international economic co-operation and co-ordination of national policies will have to assume central importance in the coming years. In other words, reliance on "market mechanism" alone may take the OECD economies away from vigorous growth unless there is coordination and "policy planning" with a longer-term perspective. This would suggest a sharp departure from the present policy postures in the advanced industrialised countries.

Although this paper has been focused entirely on the problems of the advanced industrialised countries and on the possible role of new technological innovations in these countries, we do not want to suggest that these technologies do not have implications for the developing countries. Obviously there are. However, this rather important issue requires separate and in-depth examination. Here we can only note that the developing countries will have to work out consciously their own strategies so that they can pursue their autonomous development more vigorously. At minimum they will have to safeguard themselves from being further dominated by the developed countries through these new information-processing technologies.[33] These changes will also have an impact on world trading patterns and patterns of industrialisation which can be turned to the advantage of the developing countries provided there are conscious efforts by the international community and by the national governments of the developing countries.☐ (*Concluded*)

WHAT A SCREAM !

A feminist theatre group, Mrs Worthington's Daughters, has come up with a novel and enterprising way of attracting money to the stage. Not for them the standard application form to the Arts Council or adverts in their programmes; instead, the touring company, set up three years ago, is offering to work the names or products of commercial sponsors into the scripts of their plays.

Imagine the sort of thing:

Ariel sings:
Full fathom five thy father lies
(accessible only by Northsea Dives)
Of his bones are coral made

Miranda, dancing:
Coral Maid! Coral Maid! Coral Maid!
It's the new ice cream with the yummy-scrummy taste!

Ariel resumes:
These are pearls—yes, watch her eyes light up as you give her a Prospero pearl, imitation but indistinguishable from the real thing—oh, dear, where were we...ah, yes...that were his eyes.

Miranda:
I scream, you scream, we all scream for Coral Maid ice cream...

And so on. But Mrs Worthington's Daughters have yet to go as far as altering venerable scripts like Shakespeare. Instead, they propose to write sponsors' names into their new productions as well as including "live" adverts during the interval. Equity are sniffing around.

Hand-rickshaws in Calcutta

A Human Question

Unnayan, an independent organisation in Calcutta established in 1977 and engaged in community research and planning in a variety of fields, has prepared a paper for a seminar on "Banning the Unlicensed: Planning for the 'Unorganised' Sector?", in March 1982. We here publish extensive extracts from the paper as the questions raised concern a large number of poor people in Calcutta.

ON September 21, 1981, an amendment to the Hackney Carriage Act of 1919 was passed in the West Bengal State Assembly which, when and if implemented, is likely to bring to a virtual end the service of hand-pulled rickshaws in Calcutta. This legislation, which is designed to enforce the impounding and destruction of *unlicensed* rickshaws, in many ways brings to a head not only the 30-year-old controversy over whether to ban rickshaws in Calcutta, but also the wider confrontation between the authorities and the formal sector on the one side, and the huge, unorganised, so-called 'informal sector' in Calcutta.

After careful study of the rickshaw situation in the city (Published as *Rickshaws in Calcutta*, Unnayan, February 1981) and of subsequent developments, this paper presents clearly the facts about hand-rickshaws in Calcutta. In our experience the rickshaw situation is symbolic of polarisation taking place in our cities between a privileged minority with a particular set of values and a huge, and increasingly marginalised, majority of the poor. This polarisation, in one sense, is a direct outcome of the nature and structure of present systems of planning and decision-making. In this sense, and in the context of the surprising fact of legislation of this nature being put forward by a Left Government, not only the 60,000 pullers or the lakhs of households, and businesses that will be affected, but also the planners and the Government and all of us, are victims of a set of values and an unscientific decision-making process both of which need challenging and change. We believe the legislation needs re-examination; but this must take place in the course of a wider reconsideration: it is not just a question of keeping rickshaws or banning them. All citizens should know the facts, and all should take part in making the decisions.

Despite their age (they came into use in Calcutta nearly a century ago), rickshaws continue to be used throughout the city, and remain among the more heavily-used systems of transport, by all types of people — households, shopkeepers, businessmen, small manufacturers, school-children, and as ambulances. Most vehicles, however, are not licensed (only 6,009 out of a total of perhaps 35,000 to 50,000); since the number licensable was fixed at 6,000 in 1939 — over 40 years ago. For the past thirty years and more, their continued presence has however been questioned, especially by Government planners, for reasons such as that "they are slow-moving" and thereby cause congestion in the streets. At the same time, because of the "illegal" status imposed on 95 per cent of the vehicles plying, the trade — like so many others in Calcutta — is riddled with exploitation.

The confrontation has come to a head with the new legislation to enforce the impounding and destruction of unlicensed vehicles. This step, if enforced, will have drastic effects: since some 30,000 to 45,000 rickshaws are unlicensed, some 60,000 to 90,000 pullers will be rendered unemployed, as also people employed in ancillary industries; there are no plans for alternative jobs. Rickshaws account for over 10 per cent of the estimated 6.8 million trips made in Calcutta every weekday — so lakhs of households and businesses will have to find other ways to move around in the city, where transport is already very inadequate. There will be widespread disruption.

There is also the question of social justice: the legislation, whether by design or inadvertently, only serves to reinforce the already dominant position of licensed owners, who will remain unaffected. Their 6,000 licences — the last new one was issued by the Government in 1944 — are renewed every year, and no new applications are ever entertained. Why are they protected? If the Government's reasons for removal of rickshaws stand — that it is a supposedly inhuman trade and a transport mode that supposedly causes traffic jams because it is slow-moving — then why are these few protected? The reasons should not be allowed to be that 'this is what the law says'; or that many policemen are said to be owners, or that the President of the All-Bengal Rickshaw Union, the oldest owners' union, is Deputy Speaker of the Legislative Assembly.

It is also argued that it is 'reactionary' or 'conservative' to think of retaining rickshaws, and that given all of Calcutta's problems, there is need to be 'progressive', in this and other fields. We suggest that the focus of this concern is misplaced, even confused: firstly, is it really 'progressive' to get rid of rickshaws, 'conservative' to keep them? We believe it is not necessarily so, and it is much more conservative just to get rid of them but to protect the status quo where the ownership of transport in the city — as in all other fields — is concentrated in the hands of a few.

Aside from rickshaws, however, it is important to realise that rickshawallas and the uncertainty they are facing, are typical of a large part of Calcutta's life. Some 40-50 per cent of the city's work force, is employed in the 'informal sector', of which all the 'illegal' rickshaws and their pullers form a part. This means millions of people are — officially — not fully within the scope of the law, and of regulations (although there are many informal arrangements, such as bribes and settlements, by which the legal, official world reaches this sector and an uneasy and usually exploitative balance is maintained). Despite the scale of this situation, most 'planning' decisions which have tried to regulate the city's life, have seen this sector as an obstacle and have — just as in the case of rickshaws — tried to deal with problems by confrontation and exercise of authority.

Our conclusion is that the legislation may be, like many plans, the result of obsolete values, and that another type of planning process is needed, one that takes into account *all* levels of society, and all sectors of the economy in Calcutta. But even more than this, the planning process required must be not only sensitive to the lives of all of Calcutta's various citizens, but be one that can in particular constructively support and help the dominant 70 per cent majority of its population who are poor, and exploited, to improve their lives.

In terms of rickshaws, there is at present hardly much substantive ground on which such decisions can be taken. It was, therefore presumed that a comprehensive policy paper, looking at all aspects of the subject, could help in the decision-making process. The cycle-rickshaw as a comparative mode was also included to give an overall picture of the informal sector passenger transport modes in the city, and the result was the Unnayan report on *Rickshwas in Calcutta*.

A synopsis of the attributes of hand-rickshaws is provided below, largely gleaned from the report. This is done to highlight the role of the vehicle in various dimensions, as well as to place in context the various reasons which traffic planners and policy makers have put forward to date, for the restriction and even removal of rickshaws.

In balance, we find the hand-rickshaw to be little understood, much maligned but a useful and efficient transport trade. It needs organisational, technical and structural change, but is nevertheless appropriate to the particular demands of Calcutta's physical, social and business networks. While it is true that there are severe structural problems in the trade, and that some traffic conflict takes place, there has to be a better plan than a sweeping removal which will cause so much disruption in the lives of so many people and in the life of the city.

The hand-rickshaw, the many roles that it plays in the life of Calcutta, and the question of whether to ban it or retain it, are symbolic of a much wider process of change and 'development' that is increasingly affecting all of us. It is vital that we take part in this change and not let it simply envelop and overwhelm us. We therefore strongly recommend careful review of the policies relating to this trade that seem to be emerging in the city, and urge all citizens to join in a public debate.

There are about 35,000, possibly 50,000, rickshaws in the city, with an estimated 75,000-1,00,000 pullers. The number of workers directly or indirectly involved in the hand-rickshaw trade represents around 8 per cent of the total working population in the hand-rickshaw zone of the Calcutta Metropolitan District. It therefore supports more than one lakh families or over half a million people living in Calcutta and its hinterland of Bengal, Bihar and Orissa.

The trade is highly labour intensive, presently costing only roughly Rs 300 per work-place.[1]

Surveys suggest that 92 per cent of the pullers come from Bihar, and maintain a kind of dual residence, in Calcutta and in their native villages. Of them 96 per cent are married, but only 7 per cent have their families in the city.

Rickshaws are readily available, at convenient locations, at all times of day and night. They carry passengers close to their final destination. They are available late at night, and in a city where there are few ambulances, they are specially useful for emergencies such as taking invalids to hospital. They are available during rush hours when other modes are grossly overloaded, and especially for movements in and through the dense neighbourhoods of the central city.

During the rains in Calcutta, when the streets are usually flooded, the rickshaw is often the only mode available or willing to transport passengers. (The 'extra' fare charged at these times has to be seen relative to the fact that the puller takes a considerable risk, in the conditions of most Calcutta roads, of running on a surface he cannot see because of the flood water, and that the passengers can reach their destination without getting dirty or spoiling their clothes. Also, that taxis — if they can ply — usually charge a premium at such times.)

They offer freedom from worry — children are sent to school by parents in the care of a trusted puller.

The rickshaw is used for various types of travel, as given below:

To/From Work	During Work	Education	Medical	Social	Shopping
19%	7%	17%	9%	23%	23%

Based on a survey conducted by Unnayan in 1980 with a sample of 100 rickshaws, distributed throughout the city.

About 7 lakh one-way passenger trips a day are made by hand-rickshaw in the Corporation area; roughly the same as the number of trips made in trams every day and 10 per cent of the total number of daily trips (6.8 million) made in Calcutta.

Goods carriage is a major activity near all the central markets, especially Sealdah, Machuabazar and Posta. In a count of rickshaw movements in the early evening on Howrah Bridge, 70 per cent of the vehicles carried goods or bulky baggage. Rickshaws allow owners to travel with their load; sometimes goods are carried unaccompanied. They are ideally suited for petty tradesmen, to carry small quantities of goods, not sufficient for tempos. Rickshaws are ideally suited for delivery to small establishments in narrow lanes where most petty businesses and industries in Calcutta are located, and are in some places the only vehicle that can travel in such areas. In other words, their removal would make such transport very difficult for all such concerns — or require replacement by another, similar vehicle.

Passenger travel by rickshaw is costly when compared with public modes like bus, tram and train. However, for short distances (below 1 km) it is cheaper than taxis. One kilometre by taxi is Rs. 1.50 (taxi fare however is fixed for first 2 km, meaning a minimum charge of Rs 3), whereas in a rickshaw 40 paise to Re 1 is the rate per km. For goods carriage, rickshaws are cheaper than other modes.

Street occupancy takes two forms (a) Room for moving vehicles, and (b) room for stationary vehicles.

(a) *Room for moving vehicles*: Emergence of rickshaws on to major streets and along major roads are the only situations where serious conflict arises with other modes of traffic. At present, rickshaws (and thelas) are in any case prohibited from many major roads and much of their movement is along urban back lanes, where they do not affect the flow of other vehicles since the latter cannot get there. On main roads, rickshaws tend to keep close to the kerb.

It is agreed that in planning transport for the city, priority should be given to mass public transport; however, banning of rickshaws from, say, all bus routes would have only a marginal effect on bus speeds and would seriously reduce the usefulness of rickshaws.

Calculations by traffic planners of junction capacity and traffic flow normally tend to assume that motorised traffic is the dominant and legitimate mode in a city, while slow-moving vehicles are marginal and disruptive. In Calcutta and in most Indian cities this assumed marginality is not necessarily correct, either in terms of the ratio of numbers of vehicles or in terms of social and economic functions. The 'disruption' said to be caused should therefore be seen in relation to the importance of the roles played by the different transport modes in the lives of citizens, not simply from the point of view of car drivers. For rickshaw-pullers and their passengers, motor vehicles are a nuisance and dangerous.

(b) *Room for stationary vehicles:* Space requirements for stationary rickshaws are very small, in comparison to other modes: Rickshaw — 1.3 m². Car — 12 m². Bus — 28 m².

A major reduction in the number of stationary rickshaws would provide relief to trucks near retails markets but would have little effect on general traffic flow; and would seriously reduce the effectiveness of rickshaws.

Rickshaws are cheap, costing around Rs 600 per vehicle, and are easy to maintain compared to other modes. The cost of the vehicle is recovered within the year, given prevailing costs, rates and wages. Energy is purely manual, and so it is labour intensive. This makes the running of the vehicle independent from the crunch of the fuel crisis (which caused, for instance, taxi fares in Calcutta to rise from 125 paise per km in 1980, to 138 p in January 1981 and 150 p in June 1981; 20 per cent in six months) but also pollution-free — which is not an insignificant issue in our cities. This is aside from the issue of using renewable energy (man-power) and saving non-renewable energy forms such as petrol.

Very few pullers own their own vehicles — less than one in a hundred. The normal custom is that the puller rents his vehicle from the fleet of an owner, on a shift basis. The owner typically takes responsibility for the cost of keeping the vehicle in service including payment for repairs, licensing and any overnight garaging.

A licensed rickshaw is a lucrative investment, offering a return on capital of about 150 per cent per year. A rickshaw licence can also be sold, for prices up to Rs 1500 and even Rs 3,000. The average fleet size appears to be 25 vehicles, inclusive of unlicensed ones.

Interests of owners of vehicles licensed in Calcutta city have been represented since 1939 by the All-Bengal Rickshaw Union. The Rickshaw Owners' Association represents the interests of owners of vehicles licensed up to 1980 in South Dum Dum, Baranagar and Rajpur municipalities.

Rickshaw owners are often people with considerable influence, and interest in the trade is therefore heavily vested. Some examples are that the President of the All-Bengal Rickshaw Union (ABRU) is the Deputy Speaker of the West

---

[1] The term 'cost per work-place' refers to the cost incurred to employ one person. One new rickshaw costs about Rs 600, and is usually used by two pullers on a shift basis; giving a figure of Rs 300.

In a country like ours, where labour is plentiful, finance relatively scarce (or at least concentrated and unavailable), and unemployment high, the need to provide employment ('work-places') at as low a cost as possible, is very acute. This need, to make this cost as low as possible, is now well recognised by economic planners throughout the world; in this sense, hand-rickshaws form a relatively 'efficient' trade — aside from their other contributions to life and society.

Bengal Assembly; we have also heard that many members of the Calcutta police force are owners of rickshaw fleets. The number of people owing the existing rickshaws, licensed or unlicensed, is however not yet known. (Why this information should be treated by the Government like an official secret is not clear.)

There are 35,000 rickshaws plying in the city, of which only 6,000 are allowed to be licensed by the Calcutta Corporation; an as yet undetermined number were licensed up to 1980 in some municipalities around Calcutta. The 6000 ceiling on licensed vehicles for Calcutta city was established over forty years ago (1939) and has not been updated since then, despite the enormous growth of the city.

There are four types of licences for the rickshaw trade: (i) Owner's licence (by the Hackney Carriage Department); (ii) Calcutta Corporation licence (Road Tax); (iii) Owner's Trade/Business licence (by the Calcutta Corporation); (iv) Puller's licence (Hackney Carriage Act).

The owner's licence is the most important, but new licences have ceased being issued after 1939. No new vehicles are legally allowed to be manufactured; meaning even old rickshaws are legally not allowed to be replaced by new ones. Vehicle renewal however takes place by gradual removal and replacement of parts.

By an earlier law, unlicensed vehicles were liable to be impounded by the police and a fine not exceeding Rs. 100 had to be paid (Section 16, Calcutta Hackney Carriage Act 1919). However, after the May 1980 amendment (insertion of a new Section 70A) of the Hackney Carriage Act, owners are liable to pay a fine of Rs 50 to Rs 500 or undergo three months' imprisonment; this penalty is being enforced more strictly. Owners of unlicensed vehicles claim that the fines they are being forced to pay against their vehicles which cost about Rs 600 each exceed the penalties which, for instance, minibus owners have to pay for traffic violations against their vehicles costing Rs 1 lakh each.

The Hackney Carriage Department is responsible for seeing to it that the vehicles are road-worthy, including having lamps and bells. Pullers should be competent and have sufficient knowledge of localities in Calcutta. They should not be less than 18 years of age.

Traffic control specifies that rickshaws should not ply between certain areas at specified times (such as Park Street, Chowringhee, Chittaranjan Avenue).

An informal understanding among rickshaw-pullers prevents customers from bargaining for lowest fares, since the pullers remain consistent about their price. On the other hand the customer, on reaching the destination, is in an advantageous position and may walk off without paying the demanded fare — leaving the puller protesting. This forms an important market control.

Of the average Rs 12.50 gross income earned per half-day shift by a rickshaw-puller, the owner takes Rs 2 as hire charges, and the puller retains Rs 10.50. A puller's annual income is around Rs 3,500. About one-third is kept for his subsistence in Calcutta; the rest is sent home to support dependants. Against an approximate vehicle cost of Rs 600, an owner typically retains about Rs 1000 per year, after licensing and maintenance expenses. The rickshaw trade is labour-intensive; the cost per work-place is around Rs 300. The annual in-take in fares in the hand-rickshaw trade is of the order of Rs 28 crores. Of this, about Rs 23.50 crores is the main income of the 75,000 pullers in the city.

Contrary to popular belief, hand-rickshaw pulling is not more 'barbaric' than mining, freight loading/unloading, etc. In fact, the even distribution of weight in a hand-rickshaw, coupled with the unusually large size of the wheels, makes rickshaw-pulling a relatively less strenuous occupation, since the wheels develop a momentum of their own.

While the cycle-rickshaw often seems to be less strenuous than the hand-rickshaw, reports from Madras and elsewhere suggest that cycle-rickshaw pulling constitutes a greater hazard to health for the puller, and that the incidence of chest disease, muscular strain and impotency is significantly higher among cycle-rickshaw pullers than among hand-rickshaw pullers.

The conventional argument against rickshaws is that they are "exploitative", because they have one man pulling another. The physical labour involved in pulling a rickshaw is less than in mining, freight loading/unloading, etc., which are also done by some men to serve and benefit other men. In fact, when moving, the rickshaw presents a relatively light load, because of the weight and nature of the wheels, and problems arise only when sudden braking or turning is required. Brakes on the vehicle would solve this problem, and similarly a number of simple technical improvements can be made to resolve other problems of safety and comfort.

Indeed, the cycle-rickshaw also has one man pulling another — but it is not usually looked at with the same distaste. Why? Is it because there is an apparent mechanical advantage? But does this argument still stand if it is known that rickshaw-cycling can cause much more severe health problems than pulling? Or is it just that the hand-rickshaw presents a dramatic image of what is wrong in society — and it is convenient to sweep such images away?

WHAT should be done?

The details of the rickshaw trade as given above obviously raise a complex of questions, questions which impinge on a wide area of civic experience. There is the question of the Government causing sudden and massive unemployment, in the name of improving traffic and protecting 'legal' activities. There are legal and constitutional questions, regarding the very imposition of limits to the number of people practising a given trade (by fixing the number of licences): and regarding the perpetuation of limits outdated now by over 40 years and designed by a colonial regime in vastly different urban circumstances.

There is the conflict of different modes and speeds of traffic on Calcutta's inadequate roads; to whom do the streets belong?

There is the problem of the rickshaw-pullers themselves, and their livelihood, which has to be seen both from a humanitarian angle and as well as from the angle of social, political and economic relations of so-called 'migrants' from another part of the country to the city. This is especially so when both the rickshaw-trade and the Bihar-Calcutta relationship are, albeit separately, over a hundred years old.

There is the issue of widespread disruption being caused by enforcement of the legislation, in patterns of civic services and in social and business networks in the city. These patterns have grown with the city's growth and are at one with its tissue and texture.

There is the severe concentration of ownership of the trade. There is the struggle between the situations of surplus and therefore exploitable labour on the one hand, and the perpetuation of exploitation by the keeping of services and trades as "illegal", on the other. There is the question of *how* decisions should be made in a situation like this — enmeshed, entangled, fraught with contradiction: is simple reliance on legality and legislation enough?

These questions are obviously not answered by a sweeping removal. What should be done, and who should do it?

From what we have learnt, it seems clear to us that there are no simple answers. Our purpose in preparing this paper is to admit just that — and to put this situation before as many people as care to listen. It does seem to us, however, that the minimum required is a policy-preparation and decision-making process very different from the one followed for the legislation. From the fact that the legislation does not begin to address the complexity of the situation, it should be clear that the interests of traffic management, or policing of legality, are not sufficient to address the demands of real life. In this context, our only suggestion is a wider, and public, debate, a plan-preparation process which is more sensitive to all the issues and interests involved. We are confident that sensible suggestions will arise from a democratic process such as this; some are already obvious such as separation of traffic by area and by roads, and change in ownership structure.

We believe that these questions involve every one of us: their answers, because they are true of any and every instance of change around us, and whether you and we give them or not, will change our world.

How do you think it should change?

The New 20-Point Programme
for
Accelerated Growth with Social Justice
Delhi Gives a Lead

Immediately after the Prime Minister presented the new 20-Point Programme, on January 14, the Delhi Administration was quick to constitute a high level Steering Committee under the Chairmanship of the Lt. Governor on January, 20. Since then it has identified the plans and projects under each sector of development which have a direct bearing on this national Programme and has taken steps to accelerate the pace of their implementation.

SOME SALIENT FEATURES

- * Irrigation to additional 3,500 hectares in Sixth Plan; 400 hectares this year. New scheme for exploitation of effluent water irrigation to 8,000 hectares launched.
- * 3,000 rural poor to get assistance every year for setting up ventures on self-reliance basis.
- * Minimum wages of agriculture and industrial labour raised by 25%; 8 lakh workers to benefit.
- * Special Component Plan to benefit 1,80,000 Harijan families (9,27,000 persons); Rs. 523 lakhs in Sixth Plan for Harijan Welfare.
- * Piped Water supply now available in 138 villages, 45 more villages to benefit this year. All villages to get the facility by next year.
- * 800 house sites for the landless in rural areas this year; 7,500 more being developed out of which development of 1,500 to be completed very shortly. Housing subsidy to 7,500 landless villages in Sixth Plan; 1,500 this year.
- * 1,150 tubewells energised in 1981-82 at a cost of Rs. 100 lakhs. Same amount to be spent next year. 36 Harijan Bastis electrified, decision to electrify all.
- * Target of 30,00 sterilisations for next year against 15,000 this year. Ten more Family Welfare Centres to be opened.
- * Comprehensive measures to fight T.B., Leprosy, Blindness and ill-health.
- * Public distribution system revamped and has now 2,860 F.P.S.'s, 1,730 K. Oil and 1,827 Coal Depots.
- * Outlay on Handicrafts increase from Rs. 1.50 lakhs in 1980-81 to Rs. 5 lakhs in 1981-82 and the assistance for handlooms increased from Rs. 16.44 lakhs to Rs. 23.37 lakhs.
- * For mother and child care, 4 Welfare Institutions and 38 work centres for Women, 146 maternity and Child Welfare centres, 14 children's institutions and 11 day care centres are functioning; under special nutrition programme 96,000 children and 17,000 women are being provided nutritious food besides more than one lakh school students in M.C.D. areas and all in N.D.M.C. areas are getting mid-day meals.
- * Almost all children in 6-11 age group are in Primary Schools; 80% of these in 12-14 age group are in middle schools, Part time schools set up for those who cannot afford regular schooling.

Delhi Administration: Delhi.

DIP/PLAN-6/82

Arms Race and NIEO

INGA THORSSON

IN broad terms, the present study has taken into account the current situation in the field of disarmament and the importance of disarmament for detente, international peace and security, economic and social development, the promotion of international cooperation and their reciprocal relationships. The study has been made in the context of how disarmament, when achieved, can contribute to the establishment of a New International Economic Order. Furthermore, the study was required to be forward-looking and policy-oriented, enabling it to serve as a basis for decisions on concrete actions to reallocate real resources through disarmament measures to economic and social development, particularly in Third World countries.

Common sense alone tells us that military preparations are an economic burden. The arms race and development are to be viewed in a competitive relationship, particularly in terms of resources. Or to put it another way: the arms race and under-development are not two problems; they are one. They must be solved together, or neither will ever be solved.

It is a historical fact that governments have, over the past 30 years, spent vast resources on armaments, resources which — on grounds of morality, on grounds of equal human justice, on grounds of enlightened self-interest — ought to have been directed to ending world poverty and building for human and material development. In this way world armaments are among the causes of poverty and under-development.

The 1972 United Nations study on this same theme concluded that disarmament and development "stand fundamentally apart". Taking their point of departure, this statement is still true. Ten years ago and, as duties of the industrialised countries went, development was simply equated with development assistance. But since then, the development discussion has been broadened to involve basic structural changes in all societies, within states and among states, including more equitable distribution of income, access to the means of production and greater participation by all groups in decision-making, and progress towards the establishment of a New International Economic order.

In the present study, we have introduced a new conceptual framework, defined in a dynamic triangular interrelation between disarmament, development and security. We have taken a broader approach to the problem of security. In our era, national security can no longer be equated with military might. Even less can international security, that is, security *for all,* do so. Also, we demonstrate that threats to security may be made and aggravated in many ways, including those that go far beyond purely military threats. It was recognised by the first UN General Assembly Special Session on Disarmament that the arms race itself has become a threat to the security of nations. Thus, disarmament, particularly nuclear disarmament, would directly enhance security, and, therefore, prospects for development.

National security is not a goal in itself. Its ultimate purpose must be to secure the independence and sovereignty of the national state, the freedom of its citizens, freedom and the means to develop economically, socially and culturally, which defines exactly what we mean by "development". In today's world this can never be achieved by any state at the expense of others. In a world of interdependence, only through global or international security will it be possible to reach the objective of national security — for the ultimate goal of freedom, well-being and human dignity for people throughout the world.

Today there is an array of intensifying non-military threats which aggravate the security problems of states. Such non-military threats can be described as

- ● widespread reductions in prospects for economic growth;
- ● existing or impending ecological stresses, resource scarcities — notably in the field of energy and certain non-renewable raw materials — and a growing world population. Today's stresses and constraints may translate into tomorrow's economic stresses and political conflicts;
- ● the morally unacceptable and politically hazardous polarisation of wealth and poverty.

The appalling dimensions of poverty, the destruction of the environment, the accelerating race for arms and the resulting global economic malaise are largely problems of our own making. The Group states that it is well within our collective capabilities and within the earth's carrying capacity to provide for basic needs for the world's entire population, and to make progress towards a more equitable economic order, at a pace politically acceptable to all. The Group reaffirms that the arms race is incompatible with the objectives of a New International Economic Order. Of course, also in the future, economic growth is possible even with a continuing arms race, but it would be relatively slow, and very unevenly distributed both among and within regions of the world. We show, on the other hand, that a cooperative management of inter-dependence can be in the economic and security interests of all states. But the adoption or rather the evolution of such an outlook is quite improbable if the arms race continues.

The author, a Swedish expert and Member, Executive Committee, International Foundation for Development Alternatives, was chairman of a group of 27 governmental experts which studied the relationship between disarmament and development. The report was presented by Inga Thorsson to the political and economic committees of the UN General Assembly. We reproduce here the essential part of the presentation to the economic committee, from *IFDA Dossier,* March-April 1982.

It is imperative that non-military challenges to security are treated as non-military. If this is not recognised, if states fail to accept and persevere in tackling these challenges through voluntary measures and cooperation, there is a grave risk that the situation will deteriorate to the point of crisis where, even with a low probability of success, the use of military force could be seen as a way to produce results sufficiently quickly. This is far from being a remote possibility. In recent times there has been a marked and increasing tendency in international relations actually to use or threaten to use military force in response to non-military challenges, not only to "security", but also to the secure supply of goods and the well-being of the nations facing these challenges.

The Study has documented that at least 50 million people are directly or indirectly engaged in military activities world-wide. This figure includes, *inter alia*, an estimated 500,000 qualified scientists and engineers engaged in research and development for military purposes.

Military research and development remains by far the largest single objective of scientific enquiry and technological development. Approximately 20 per cent of the world's qualified scientists and engineers were engaged in military work at a cost of around $ 35 billion in 1980, or approximately one-quarter of all expenditure on research and development. Virtually all this R & D takes place in the industrialised countries, 85 per cent in the USA and the USSR alone. Adding France and Britain would push this share above 90 per cent. It stands to reason that even a modest reallocation to development objectives of the current capacity for military R & D could be expected to produce dramatic results in fields like resource conservation and the promotion of new patterns of development, better adapted to meeting the basic needs of ordinary people. This is — evident from the fact, which is also among our findings, that, on an average, a military product requires 20 times as much R & D resources as a civilian product.

The 1972 report on the subject identified more than 70 possible alternative uses. Our present investigations suggest, in more elaborated and detailed ways, for instance, that production workers in the military sector could quite easily transfer their skills to the development, production and installation of solar energy devices. Environment, housing and urban renewal are other areas likely to gain from the possible rechannelling of military R & D. New transport systems, particularly in urban areas, are sorely needed and have long been regarded as a major civilian alternative for the high-technology industries in the military sector.

In purely financial terms, world-wide military expenditures by 1981 exceed the astounding level of 520 billion dollars, representing 6 per cent of world output. This amount is roughly equivalent to the value of all investible capital in all Third World countries combined. The effect on the economic and social spheres in our societies of the arms race extend far beyond the fact that 5 to 6 per cent of the world's resources are not available to help satisfy socially productive needs. The very fact that these resources are spent on armaments accentuates the inefficient allocation of the remaining 94 to 95 per cent, within and between nations. Three fundamental characteristics of the arms race reinforces this disallocation: first, the sheer magnitude of the volume of resources; second, the composition of expenditure, most particularly the stress on R & D, affecting investment and productivity in the civilian sector; and thirdly, the fact that this massive effort has now been sustained for over thirty years.

As an illustration of the contribution which can be made by disarmament measures, even limited, to world development, one study submitted to the Group projects global economic prospects under three types of hypothetical scenarios, namely, a continued arms race, an accelerated arms race, and modest disarmament measures involving the release of some resources for reallocation into the Third World. Utilising the United Nations input-output model of world economy, it is calculated that an acceleration of the arms race would adversely affect global economic well-being in all but one of the regions of the world. I will here highlight some general results. Besides the negative impact on per capita consumption, an accelerated arms race will also result in a decline of the world's stock of capital, reduce the value of non-military exports, and entail reductions in industrial employment in the poorest regions of the world.

In contrast, a scenario of even modest disarmament measures is shown to yield higher per capita consumption for different regions and in addition bring about a higher world GDP, a larger capital stock, a general increase in agricultural output, to mention only a few of the obvious economic gains. Besides these global economic gains, a scenario of modest disarmament would also yield significant benefits for the poorest regions of the world. This conclusion is by itself of considerable significance, what it is remembered that in many cases, increases in military outlays by industrial countries have been accompanied by a decline in their aid transfers, despite the repeated request for the fulfilment of the UN targets for official development assistance and despite the fact that existing volumes of assistance are grossly inadequate to meet the basic requirements of the poorer countries. The report shows that even a minor part of savings from modest disarmament has the potential of dramatically enhancing present levels of assistance.

We can make similar calculations for the past. For instance, if half the funds spent on armaments throughout the world from 1870 to 1975 had instead been invested in the civilian sector, it has been calculated that annual output at the end of that period would have been 200 billion dollars higher than it actually was — a figure in excess of the aggregate GNP of Southern Asia and the mid-African regions. And mark well, this growth would most likely have been achieved without any extra demand for investible resources.

Military outlays fall by definition into the category of consumption and not investment. As a consequence, steadily high or increasing military outlays tend to depress economic growth. This effect may be direct through displacement of investment, and indirect through constraints on productivity....

On the basis of the present report, and the research commissioned for it, we can confidently conclude that military budgets are dead-end expenditures in all kinds of economies, be they market, centrally planned, or mixed; be they industrialised or not. Military expenditures do not foster growth. Through their inflationary effects — thoroughly analysed in the study — and the general economic and political malaise to which they contribute, military spending inhibits the capital investment required for development. Through the drain on the most valuable research talents and funds, it restrains productivity gains and distorts growth in science and technology. The military sector is not a great provider of jobs, on the contrary. Military spending is one of the least efficient kinds of public spending. It drains away funds that could relieve poverty and distress. The very nature of military spending heightens tensions, reduces security and underpins the system which makes even more arms necessary.

The structural changes implied by the movement toward a New International Economic Order require a strong and sustained political commitment. Costs and benefits are difficult to compare in conventional ways. The costs tend to be felt sooner than the benefits. But there is little doubt that all societies would reap major benefits from a reduction in the economic burden of military activities and that there is a strong mutuality of interest between industrialised and developing countries in this respect. Therefore, the Group unanimously recommends that Governments urgently undertake studies to identify and to publicise the benefits that would be derived from the reallocation of military resources in a balanced and verifiable manner to address economic and social problems at the national level and to contribute toward reducing the gap in income that currently divides the industrialised nations from the developing world and establishing a New International Economic Order.

The Group has examined the technological feasibility and economic potentials of a process of conversion of resources from military to civilian purposes. The main object, in economic terms, is to devise short-and long-term policies designed to consolidate the goal of disarmament with economic goals of growth, monetary stability, full employment and foreign trade balance. While, as a matter of course, conversion itself will have to await some measure of disarmament, preparation and research for an economic conversion policy cannot be deferred until such time.

The defence industry everywhere is characterised *inter alia* by a high degree of geographical concentration. It also involves a considerable degree of specialisation of its work-force. This apparent exclusiveness should not prove to be an unsurmountable problem, because:

- conversion and redeployment are not phenomena uniquely associated with disarmament. Any form of economic and social change represents a continuous process of conversion;
- conversion is feasible as a significant part of military demand relates to goods and services essentially identical to civilian ones.

Primary responsibility for conversion, in an overall sense, inevitably falls on the central government, particularly as regards planning and initiation of preparations for such a process. The nature and extent of government involvement, following disarmament measures, in the process of conversion itself will vary from country to country, depending largely on the prevailing type of economic system. If transition is to be as smooth as possible and involve the minimum waste of finite resources, it is vital that every effort be made to anticipate the extent and the character of the conversion problems that will arise. It is therefore obvious to the Group, that preparations for conversion should be among the first steps on the road to disarmament. Hence, the Group recommends that Governments create the necessary prerequisites, including preparations and, where appropriate, planning, to facilitate the conversion of resources freed by disarmament measures to civilian purposes, especially to meet urgent economic and social needs, in particular in the Third World.

The General Assembly mandated the Study to indicate concrete actions to reallocate real resources released through disarmament measures to economic and social development, particularly for the benefit of the Third World. In doing so, the Group has also considered a French proposal presented at the Tenth Special Session on the establishment of an international disarmament fund for development.

Obviously, the achievement of disarmament measures which will release real resources will in the first instance most directly benefit those States which are affected by these measures. Practical ways by which disarmament may redound to the benefit of development in the South may take many forms. Beside changes in economic relations to the benefit of the Third World, it is widely recognised that increasing the magnitude and predictability of flows of capital to the Third World, as grants or on concessional terms, is of vital importance. One proposed way of fostering these flows would be to establish a special fund for development to be financed from budgetary savings through the implementation of disarmament measures, as well as a levy on armaments, or voluntary contributions. The Group is unanimous in its opinion that the disarmament dividend approach to financing a fund — by which savings won by concrete disarmament measures or a portion thereof would be allocated to development needs— is most in accord with the United Nations conception of disarmament and development as well as being the most feasible. The Group unanimously recommends that further consideration be given to establishing an international disarmament fund for development and that the administrative and technical modalities of such a fund be further investigated by the United Nations with due regard to the capabilities of the agencies and institutions presently responsible for the international transfer of resources. ...

No analysis of the socio-economic gains of disarmament can be complete without referring to its catalytic effects, which may eventually produce a global climate more conducive to further and cumulative measures in the same direction. This would be in contrast with the present situation where higher outlays on the military sector are often attributed to the continued threats emanating from an adverse strategic environment. An outstanding feature of the prevailing international climate is the uncertainty which is characterising the exercise in rearranging the North-South relationship within the framework of a NIEO, as well as the uncertainty of stabilising the East-West relationship within the framework of detente.

In both these respects, the catalytic effects of military restraint can considerably improve the results obtained so far because the politico-strategic considerations governing the arms race tend to interfere with the economic considerations demanding a cooperative management of global interdependence. Stabilisation of the international monetary system, rectification of trade imbalances, resolution of the existing balance of payment difficulties and a continuous flow of capital, finance and technology among the more and less industrialised, economies, constitute, as this committee is well aware, some of the basic prerequisites of a NIEO. Disarmament measures can improve the prospects of international cooperation in all these spheres because there are sufficient indications to suggest that the ongoing arms race has exacerbated the disruptive influences on the international monetary system, aggravated the balance of payment problems of the less industrialised economies and interrupted a continuous flow of capital and technology transfers among the more and the less industrialised economies.

Successive crises in the international monetary system imputable in part to the massive creation of international liquidity through the deficits of some reserve currency countries, have been significantly associated with galloping inflation and rapid increases in military expenditures. The growing international traffic in arms has also contributed to the balance of payment problems of the importing countries. Seventyfive per cent of arms traded internationally go to the Third World.

The disruptive influence of the arms race has become a matter of particular concern in the field of International trade. The increasing preoccupation of the market economies with their immediate problems of stagflation is seen to affect their role as the largest participants in the aid and trade relations of the Third World.

It is widely acknowledged that the true foundation of national security is a strong and healthy economy. The present study presents overwhelming evidence that the contemporary military establishments significantly distort and undermine the very basis of sustained economic and social development in all countries. Accordingly, the Group recommends that all Governments, but particularly those of the major military powers, should prepare assessments of the nature and magnitude of short — and long-term economic and social costs attributable to their military preparations so that the general public be informed of them.

This study has in my view strengthened the economic and social case for this disarmament-development relationship by identifying military spending as an impediment to economic growth and social development and the arms race as an obstacle to the establishment of a New International Economic Order.

The Group has indicated the political and economic potentials of rationally imperative alternatives in suggesting that policies aimed at implementing the disarmament-development relationship are likely to broaden the base of East-West detente and put the North-South dialogue in a mutually advantageous frame of reference.

Its report should not be considered an individual project. I should like to express a hope for an effective follow-up process, to the benefit, first of all, of the billions of human beings inhabiting this world of ours.☐

The Public Account Car

(*Contd. from page 6*)

period of two years has been Rs 45,000 minus Rs 20,000, or Rs 25,000.

During this period of two years, the official price of the new car went up to Rs 72,000. Due to the long waiting list of those registered for the purchase of a new car, it also commands a premium of Rs 10,000 in the open market. Compared to the open market price of Rs 82,000 for the new car, Seth was able to strike a deal for his two-year-old car at Rs 57,000. He took due precaution to get the payment partly by cheque and partly in cash. He took Rs 32,000 by cheque and cash was not arbitrarily decided. Since Seth took a course in Financial Management, he never takes any decisions arbitrarily. The amount of Rs 32,000 was exactly equal to the book value of his car at the time of disposal.

The amount of Rs 32,000 received by cheque was promptly paid to the bank against the outstanding loan. The balance of Rs 18,000 out of the total loan of Rs 50,000 for the purchase of car had already been returned from the depreciation allowance. So, the account of the car was completely closed.

Seth showed Rs 25,000 in the books as post-tax expenditure on this car during the two years. He also received back Rs. 25,000 in cash at the time of disposal of the car. So, the net out-of-pocket cost to him for the maintenance of the car for two years was *nil*. The economics of all his previous cars has been the same. He is quite confident that it will continue to be the same in future.

Seth is, however, not satisfied with maintenance of his car at no cost or at public cost. He would like to make some profit out of it. He has arguments in favour of an increase in the rate of depreciation allowance as well the volume of deficit financing. His favourite slogan is: "Long live Inflation! Long live Book Value Accounting!" ☐

We have accepted in India as our objective a socialist pattern of society. That means not only economic organisation but something deeper which involves a way of thinking and living. The acquisitive society, whose chief aim is profit-making, not only brings conflict in its train but is opposed to the basic urge of modern man for social justice. Socialism is based on the growth of material resources as well as social justice and a co-operative method of working.

VOL XX NO 31 SATURDAY APRIL 3, 1982 Re 1

EDITOR'S NOTEBOOK

Meaning of Maneka Politics

A bizarre exhibition of how to wash dirty linen in public has become the centre-piece of politics of this great country. One more instance of the frightening bankruptcy that has overtaken our national life.

Maneka Gandhi has always been a misfit in Indira Gandhi's household. There is therefore nothing surprising that mother-in-law — daughter-in-law tension, so familiar in India's middle-class houses, should have reached the precincts of the Prime Minister's residence. What is significant is that this tension should erupt in public in the form of a political issue, Maneka defying Indira and addressing a gathering of Sanjay-men led by his close and trusted lieutenant, Dumpy Ahmed. And the amusing point about it was that while Indira and the officials of the Congress-I lauding Sanjay Gandhi's memory were attacking the Dumpy group as not being true to the Sanjay ideals (whatever these might have been), Maneka and her associates were swearing allegiance to Indira Gandhi although engaged in a clear game of attacking her.

Such confusing semantics could be traced to the fact that Indira Gandhi's party has never tried to make any objective appraisal of the Sanjay phenomenon in Indian politics. One can understand — though not appreciate — Indira Gandhi's emotional attachment to her beloved son, tragically killed in a flying accident, but there is no reason for a political leader to overlook the fact that Sanjay Gandhi in his life-time represented an acutely negative force in Indian politics, trying to introduce into it the element of the mafia. Let it not be forgotten that Sanjay Gandhi stood for something more than just being the symbol of the Indira Congress resistance to Janata harassment as it is made out these days; for, his exploits could be counted long before the Janata was born — these started soon after Indira Gandhi's spectacular electoral victories of 1971-72 and contributed in no small measure to her decision to clamp down Emergency,

which in its turn was exploited to the maximum for the promotion of Sanjay politics, almost outshining the Congress itself. Indira Gandhi, of course may overlook all this since political party leaders in India are not accustomed to do self-criticism and none of them can be accused of having admitted any serious mistakes in their career.

With this liability of not being able to boldly shrug off the ghost of Sanjay politics, it will not be easy for Indira Gandhi to get rid of the irritant posed by the present posture of Maneka Gandhi. Even to the unprejudiced it sounds hollow that Indira Gandhi's party should swear by the greatness of Sanjay in their crusade against his widow. If anything, it is Maneka Gandhi with the murky politics that she stands for, who represents the genuine brand of Sanjay politics.

Indira Gandhi's another difficulty is that the immediate tactics of the Maneka-Dumpy brigade is to make a target of Rajiv Gandhi. Since Rajiv is not of the Sanjay mould, one wonders if he would be able to stand up to the ruffian politics of his opponents who swear by his late brother's memory. In the process there is little doubt that Indira Gandhi's plans to groom Rajiv Gandhi as a political leader, if not her successor, would suffer a setback.

This is the point where politics with higher stakes enter this sordid drama. In fact, the curtain rose in this drama when Maneka's monthly magazine — which had been started in the heyday of Emergency as part of the Sanjay syndrome — was sold to RSS frontmen among whom the Rajmata of Gwalior and her henchman are conspicuous. The shrewdest of RSS politicians, Nanaji Deshmukh seems to be protesting too much that the deal was struck without his knowledge: there is nothing indeed to show that those who have become the open owners of the paper have earned his displeasure. Despite Maneka's rather exuberant denials about the forging of this RSS connection, all available signs point to a rather long-term understanding between her outfit — more precisely, her wily mother's outfit of which she is the mascot — and that of the RSS. It needs to be noted that in its bid to instal BJP as 'the national alternative' the RSS would maximise its operations to dig into every nook and corner of present-day politics. It is no small prize for this active contingent of the Right to burrow into Indira Gandhi's establishment, exploit its weak spots and play these up.

This novel form of destabilisation, unsuspected even six months ago, will unfold itself in many ways. Many a skeleton will be taken out of the overloaded cupboards. Dumpy's gratuitous disclosure about Haji Mastan's bounty being available for Sanjay's politics, is only the tip of the iceberg. More will come in the days to come — and in all this, there will be a cocktail of the plausible with a dash of blackmail.

Behind all these torments facing Indira Gandhi, the question naturally comes up: what sort of political edifice has Indira Gandhi so far sought to build up? To say that it is a pucca structure of authoritarianism will be a superficial view of things; had this been so, the logic of it should be for the parties pledged to fight authoritarianism to rally round Maneka Gandhi: hasn't this young widow bravely unmasked the Indira authoritarianism in its very den?! Political lines based on the superficialities of a situation often land in howling absurdities.

While this murky game centring round the goings-on within the country's first family has caught the headlines, the tragedy of the situation is that all elements with the promise and potentials of cleansing this low-level politics, are in a state of chronic debility. The latest example of this is provided by the CPI Congress concluded over the weekend at Varanasi. While it may be claimed that the CPI rent by political differences has been able to avert a further rift, the sum total of the labours of this party Congress is appallingly poor. CPI General Secretary Rajeswara Rao's line of going all along the line of CPI-M was obstructed by those who found it difficult to swallow the Marxists' anxiety to rope in the BJP in the crusade against Indira authoritarianism: added to this was the ideological divergence between the CPI's steadfast support to the Soviet Communist position in the world Communist disputations, and the CPI-M's touch-me-touch-me-not overtures to the Chinese Communists. The labours at Varanasi could produce a remarkable scissor-and-paste political resolution which has the merit of having bits of all trends without hammering out a firm political line. With Rajeswara Rao bringing in his own reinforcements into the leadership of this rather ramshackle party organisation, others are hanging on to him or being kept out in the cold. What the CPI leadership has brought out is a picturesque specimen of a quilt with bits and pieces of cloth of various colours stiched on to it. Such a quilt may be a testimony to their sweated handicraft but this cannot be a substitute for a powerful political line that can mobilise various patriotic trends and interests in one common national endeavour in the dark days ahead.

If the Congress-I flock of Indira Gandhi cannot see the nation beyond her image, the Left is obsessed with allergy for her to the point of missing the millions behind her. An ominously disturbing prospect before this great nation.

COMMENTARY

Electoral Process and Courts

THE Supreme Court's dismissal of the writ petition challenging certain provisions of the election law and rules as well as the manner of preparation of electoral rolls in West Bengal, has cleared the way for the Assembly elections to be held in that State. But the significance of the verdict goes well beyond the limited matter raised before the Court. While the detailed reasoning to be given later in the full judgement must be awaited, the Constitution Bench has said enough to clarify some basic issues involved and the role of the judiciary in enforcing the electoral law, In this broad sense it is a valuable judgement.

It all started with allegations about the preparation of the electoral rolls and about a surfeit of errors in both procedure and consequence. A single judge of the Calcutta High Court had passed interim orders which had the effect of delaying indefinitely the whole process of Assembly elections in West Bengal. The Supreme Court's suggestion to the lower Court would appear to have been taken as some kind of personal criticism, and the reaction was predictably hasty. Even during the hearing of the writ petition and related appeals the Constitution Bench regretted such a reading of its advice. Now the Supreme Court has explained whatever happened in the context of the role of the judiciary in relation to election laws and rules and the functioning of the Election Commission. It emerges that the High Court judge was ill advised in giving directions on three occasions restraining the Election Commission from going ahead with the publication of the final electoral rolls, originally scheduled for March 1 this year. Consequently, the whole electoral process got stalled, causing much confusion and uncertainty in the public mind, as also unnecessary bitterness among political parties, a bitterness that was reflected in the wild allegations made by senior advocates with known political leanings and their subsequent apology to the Bench.

What is important about the order passed by the Constitution Bench on March 30 is the balanced and farsighted view taken of the role and limitations (even if self-imposed) of the courts vis-a-vis the electoral process.

The Supreme Court has held the Calcutta High Court to have "acted within its jurisdiction in entertaining the writ petition and in issuing a *rule nisi* upon it, since the petition questioned the vires of the laws of election". But the lower Court "was not justified" in passing two interim orders on February 12 and 19 and in confirming the same by its judgement of February 25. Reasons: The High Court had no material before it to warrant the passing of the orders mentioned, the allegations having been "of a vague and general nature, on the basis of which no relief could be granted." While there was no lack of jurisdiction to admit the petition and issue appropriate directions, no High Court exercising its powers under Article 226 "should pass any order ... which has the tendency or effect of postponing an election, which is reasonably imminent." The more imminent the electoral process, the greater should be the reluctance of the High Court to do anything or cause anything to be done "which will postpone the process indefinitely by creating a situation in which the government of a State cannot be carried on in accordance with the provisions of the Constitution."

India being "an oasis of democracy" a fact to which the Bench has referred, may not be strictly relevant to the issues raised in the writ petition or the related appeals, but what is meant has not been left in doubt. Wisdom and statesmanship in the exercise of the extraordinary powers conferred by the Constitution on the courts is what is called for. "The High Courts must observe a self-imposed limitation on their power to act under Article 226." The purpose of such restraint is to ensure that normal democratic processes are not interfered with except for unexceptionable and constitutionally valid reasons. While saying that this limitation should be observed irrespective of whether "the preparation and publication of electoral rolls are a part of the process of 'election' within the meaning of Article 329 (B)", the Supreme Court has left the logic of this stand to be explained in its forthcoming judgement.

We need not here go into the rejection of the complaints made against the Election Commission and its officers, but note must be taken of a valid point made by the Supreme Court about the importance of doing nothing that will erode public confidence in the electoral system and in constitutional institutions. It is rightly stated that it takes years to build up public confidence of this kind which is the very basis of the effective functioning of the democratic system and its institutions; also that a single court hearing may "perhaps...sully their image by casting aspersions upon them." It is not as if such institutions and processes cannot be misused. Everyone knows they can be. And there has to be some way of getting redressal. In dealing with this aspect the Supreme Court order says that "it is the duty of the courts to protect and preserve the integrity of all constitutional institutions which are devised to foster democracy" and it is open to the citizen to question their method of functioning and for courts to "examine the allegations with more than ordinary care." The presumption of bona fides is vital; unless this basic presumption is displaced, judicial interference would be unwarranted.

The Supreme Court's concern that skepticism should not develop among the electorate about the elections held over the last thirty years is obviously valid. Once faith in the democratic process itself is undermined, every democratic institution and apparatus in the country will become irrelevant. Such erosion of faith can take place in various ways, and no one can claim that there has not been such erosion because of the way our politicians, the bureaucracy, the police set-up, and to an extent even a section of the judiciary have been functioning over the years. But then this is a matter which has to be dealt with by the people themselves, who are supreme in a democratic structure, and not by mere judicial pronouncements, with due respect to our courts.

While reactions to the judgement are bound to be mixed, what is welcome is the fact that the Court has frowned on any attempt to disrupt the electoral process through the simple expedient of unjustified or vexatious litigation. To read much more than this in the order or to minimise the importance of what has been said would not be right. Courts too should keep in mind the ultimate purpose of the democratic system and of the Constitution as laid down in the Preamble and the Directive Principles chapter. That is what really can sustain faith.

FOCUS

Sahitya Akademi Goings-on

ANJALI DESHPANDE

LITERATURE is a delicate matter. Being hypersensitive, litterateurs are prone to put up a fight for their ideas and ideals with tenacity and also to find in themselves a surge of gratitude to any institution that does them a good turn. Both these feelings are apt to influence a writer's works, and while the former can lend them greater force the latter is certain to lead to a mellowing. In a country like India where writing is not a paying profession, in terms of money or in terms of recognition, the Government, by offering a pittance as award plus the prestige associated with being recognised by a literary institution, can do nothing but harm to literature.

Allegations of racketeering in

the National Institute of Letters were last week a subject of lively light-hearted witticisms in the Rajya Sabha; but they have again brought to the fore the question whether and to what extent the Government should patronise literature. In any case the working of the Sahitya Akademi is certainly far from satisfactory.

The method adopted to select a book for the annual award in which the Akademi takes pride is designed to guarantee a high degree of secrecy and solemnity to the proceeding. Ten expert advisers of the Akademi are asked to secretly select and recommend the best books published the previous year. They are expressly barred from selecting books authored either by themselves or by their relations. The list thus obtained is circulated among twentyfive 'readers' chosen by the Akademi, who have to send in a list of five books adjudged to be the best. The readers are free to send in fresh recommendations in case any or some of the works already selected do not recevie their approval. To none of the readers is the identity of the other readers divulged. A final list of recomended books is then subjected to scrutiny by three renowned authors, and ultimately the works selected by them come up before the executive council which decides the awards. Now, the executive may also refuse the award to any language on the ground that no book has secured adequate votes. This long process is theoretically a secret one, but can the Akademi help it if the eminent readers divulge their identities to one another and allow themselves to be influenced by considerations other than strictly literary?

The heavy hand of the Government weighs down upon the Akademi via the executive council. The executive body, besides having two Government nominees and a financial adviser appointed by the Union Government, has one representative each of all languages recognised by the Government and the Akademi, elected from the general council made up of members appointed by the executive council on the recommendation of the State Governments. Autonomous body indeed!

Besides five nominees of the Union Government, and the large number of representatives chosen with the help of the State Governments, the general council includes twenty representatives of universities and a maximum of eight eminent litterateurs selected on the basis of their eminence. It is really a vicious circle, with everybody being handpicked, on the recommendation of the Governments, by the virtually omnipotent executive council, which is itself packed with people chosen by the previous executive on recommendation by the Governments and so on and on.

To make matters worse, the executive council — which not only decides the awards but selects "fellows", "honorary fellows" and "associate fellows", and effectively controls the institution by planning the annual budget, appointing most of the staff and the secretary, and executing the policies of the Akademi — has no genuine representatives of established litterateurs. University representatives are present as figureheads in the general council. More than half the finances of this body flow from the Government.

With the purse-strings in its hands and its nominees running the Akademi, the Government is assured that no non-conformist can ever be accorded the prestige of being a Sahitya Akademi award winner unless his or her talents show promise of withering away — as has been amply demonstrated in the case of many recent award-winners who have either lost the inspiration to write or author works without any literary merit. It is only when an extremely renowned litterateur can just not be ignored that he or she is accepted with reluctance.

What options are available to any author faced on the one hand by widespread illiteracy or an uninstructed, uninformed audience avidly licking up all the muck available on the footpaths, and on the other hand by the comparative prestige and publicity that can be had if one could only get an award even if it means only a pittance in monetary terms? The writer is more likely to opt for the latter and try to worm his way into the good books of the state. Lately there has been a crop of younger-generation authors who seem to write only for the sake of being called authors and whose works are poor imitations of Western literature, but who manage to occupy high seats in the field of literature exercising considerable power and even get hold of some awards. Mercifully, they have not yet figured on the Sahitya Akademi rolls.

It is significant that almost all Sahitya Akademi award winners are distinguished later on by becoming recipients of the highest literary distinction in the land, the Jnanpeeth Award. It is also significant that Mahashveta Devi, the Sahitya Akademi award winner who refused an American grant recently, is the only author not yet given the Jnanpeeth award.

The language policy of the Akademi is highly questionable. Since 1957 (three years after its inception) it started publication of an English bi-monthly *Indian Literature*. Two years later it deemed fit to publish a half-yearly journal in Sanskrit, a language dead for all practical purposes; this journal succeeded in appearing once a year, while the English journal came out regularly. That the Akademi should have struck upon English as the only possible link language in the fifties was bad enough — it betrayed the deep-rooted colonial inferiority complex of our intellectuals. Still the Akademi likes to keep up the pretence of setting high literary standards and raising the general critical outlook of the people by fostering a higher level of aesthetic sense, to which goal neither the ancient Sanskrit nor the alien English could have contributed. It was only after twenty-three years of publication of the English organ that a quarterly Hindi journal *Samkaleen Bharatiya Sahitya* was resolved upon in 1978.

Lastly, the books offered at

(*Continued on page 34*)

Heikal's View of Arab World

Interview with Dilip Hiro

Of the 1,539 arrests that President Sadat carried out a month before his assassination last October, the one which aroused most criticism abroad — both in the Arab world and outside — was that of Mohammed Hassanian Heikal. Journalist, author, and for long a confidant of Gamal Abdel Nasser, the 58-year-old Heikal today enjoys a unique position in the Arab and Islamic countries.

After his dismissal as editor of *Al Ahram* by Sadat in February 1974, his syndicated weekly column became the most widely published and discussed column in the Arabic language press from the Gulf to the Atlantic. It was his opposition to the Egyptian-Israeli disengagement agreement of January 1974 that caused an open rift with Sadat. He stuck to his view that by concluding that agreement with Tel Aviv, Sadat had taken a step which would culminate in a separate peace treaty between Egypt and Israel and result in Egypt's isolation from the Arab front. Events since then have proved him devastatingly right.

Having held to the philosophy and vision of Nasser, Heikal is now regarded by many as the roving ambassador of Arab nationalism. In this exclusive interview with Dilip Hiro, (published in the journal *8 Days*, March 20, 1982, and reproduced here with due acknowledgement), Heikal analyses the state of affairs in Egypt and elsewhere in the region.

In his view President Mubarak is already conducting dialogue with the rest of the Arab world in 'the language of shade and light, symbols and gestures'. He describes the period leading up to April 25 — the day Israel is scheduled to withdraw from the rest of Sinai — as crucially important: 'The shape of things to come after that day is being moulded now'.

Heikal argues that the US-Israeli alliance cannot be fully explained by the presence of a powerful Zionist lobby in Washington. 'All along the Americans have had two targets: to separate Arab oil from the Palestinian question and to isolate Egypt from the rest of the Arab world'. He pours scorn on the American Rapid Deployment Force. Such a force cannot in any way help the Gulf rulers to counter internal threats to their regimes. 'The Pentagon leaders ... simply want to spend more of their money on armaments'.

Aware of the strategic importance of Syria in the arc around Israel and the American designs against the Assad regime, he advises Damascus to 'expand its communications with the rest of the Arab countries and with all elements in the Arab world'.

He deplores the weakness that has afflicted the Arab front due to Egypt's defection, and the rise of acute differences among the Arab League members. The Arab nation has been compelled to entrench itself in a foxhole. It is time, he feels, that Saudi leaders realised the extent of power they possess and wielded it for the sake of the Arab nation during the current perilous period.

Dilip Hiro's questions and Heikal's answers are given below:

How different is President Mubarak from President Sadat in dealing with opposition, religious and secular, at home?

During his last days President Sadat would not listen to anything but his own inspiration. He closed the Egyptian doors to the rest of the Arab world, the Soviet Union, the non-aligned world and the Islamic world. So a new man came — Hosni Mubarak, with a fresh start. Even when he said he'd pursue the policies of his predecessor he went about it in a different way. He accepted the idea of dialogue with those holding views other than his own. Now he is trying to open dialogue with the Unionist Party and the Labour Party. He has already done so with some intellectuals. He is doing so now with the Muslim Brotherhood. He is trying to find a channel to the new fundamentalist groups like Al Jihad. Obviously it'll be very difficult for him to do so. But he has already released some of their members, and thus reduced the number of their members in jail.

What about the doors between Egypt and the rest of the Arab world?

There is already dialogue between Egypt and the Arab World; but it is being conducted like in the Japanese theatre—with the language of shade and light, symbols and gestures. Recently President Mubarak made a symbolic but important decision. After the Arab League had left Cairo (in October 1978) Sadat created something called the League of Islamic and Arab Peoples, and gave it the old headquarters of the Arab League. The other day Mubarak asked Sadat's creation, the LIAP, to get out of the Arab League building. That was an important sign which very few noticed.

Do you see Mubarak's refusal to visit Israel on Prime Minister Begin's terms in a similar light?

Yes, but that is much more complex. There were three factors involved in that. First, the psychological factor, the Israeli Government insisting that

Mubarak must visit Israel *before* the final Israeli evacuation of Sinai. Second, that Mubarak must go to Jerusalem. When Sadat first went to Jerusalem in November 1977, the city was not then 'an eternal, unified capital of the state of Israel' according to Israeli law. Finally, each day you have threats from Israel that they're going to move against South Lebanon and against the Palestinians. So the three factors together would have made anybody—leave aside a patient man like Mubarak—hesitate.

In your view, what is Israel's most basic objective with respect to Egypt?

The Israelis want to impose a stark choice on Egypt: either you choose us or the rest of the Arab world. But such a choice is simply unacceptable to Egypt.

Israel seems to be in a mood to impose its will on countries more powerful than Egypt.

Yes, the way the Israelis are talking about Caspar Weinberger, the American Defence Secretary. The way Begin told Mitterrand that France should mind its own business when the French President repeated his Foreign Minister's statement that Israel should one day talk to the Palestinians. Remember what Begin said about Lord Carrington? And to listen to Begin lecturing Chancellor Schmidt that he should get down on his knees and ask for forgiveness. I don't understand what it is about Israel that it is able to dictate to the whole world.

Recently Israel has been openly discussing the prospect of attacking South Lebanon. If this were to happen, how would Egypt react?

I think that will strain relations between Israel and Egypt very much. What practical shape or form that strain will take I cannot say. That will depend on so many factors which I don't know.

Do you think in his heart of hearts Begin wants to hold on to the last part of Sinai?

That part of Sinai has only a symbolic meaning to Begin. He knows that, in practical terms, American and Western forces would be stationed there in the form of the Multinational Force. I think what Begin wants is to return that part of Sinai to an Egypt which has completely isolated itself from the rest of the Arab world—now and for ever.

It looks as if the initiative, whether diplomatic or military, is very much with Israel.

The initiative is with Israel because everybody else is behaving passively. Unfortunately the rest of the Arab front is in a state of virtual disintegration.

Isn't Israel also helped by the fact that the American administration lacks a well-defined Middle East policy?

That is correct. But I am not one of those persons who say that Israel is leading the United States by its nose. There is a certain Israeli lobby, a certain influence for Israel in Washington, yes. But let us not forget that Israel is playing an important function on behalf of American designs in the area. All along the Americans have had two targets: to separate Arab oil from the Palestinian question and to isolate Egypt from the rest of the Arab world — and thus deprive the Arab world of its muscle and brain. In this general strategical concept, Israel is the final guardian of these two goals. Begin understands this. He knows that the Americans need him as much as he needs them.

While Egypt remains important, the Reagan Administration seems to have given priority to Saudi Arabia over Egypt. The recent formation of the joint Saudi-American military committee was a significant pointer in that direction.

Let us not forget that it was the Americans who chose Saudi Arabia over Egypt. They know that there is a treasure in the Gulf — oil — and that there has to be a guardian of the treasure. For them Israel is, in the last resort, the guardian of this treasure. When the Shah of Iran tried to be the policeman of the area he was doing so out of an inflated sense of self-importance and a false sense of identity. The same was also true of President Sadat. They forgot that during the past 30 years Israel had been the sole, and effective, policeman of the area on behalf of the West generally, and America specifically.

But once the American Rapid Deployment Force has been built up to 300,000 by 1985, won't the importance of Israel to the US lessen?

The idea of the Rapid Deployment Force is a fallacy. It is one of those inventions of the Pentagon. Either the Pentagon leaders don't look closely at the map, or don't understand the consequences of social and economic change in a country, or simply want to spend more of their money on armaments. I think the last.

Let's look at the map. There's the Soviet Union up there, and the United States and the West down here. There is an unseen demarcation line in between. The Americans won't allow anybody to threaten the Arab oil and the Soviets won't allow the other side to take one false step forward. There's no detents there.

Suppose the Americans were to march into Iran...

Then there is a possibility that the Soviets would move southwards. But I don't see that happening. The Soviets would think that they are free to move south, that it is an open option; but there is a chance that they won't actually use that option.

In any case, everybody knows that the danger in the Middle East is internal. After all, it was not the Soviet Union which destroyed the regime of the Shah. It was not the Soviet Union which changed the whole shape of Egyptian politics on October 6. The most important and drastic changes are coming from within — out of the changing social, economic and moral needs of the countries concerned.

And the American RDF is incapable of dealing with these changes?

Exactly. That is why the Saudis will have nothing to do with the RDF. They will sign agreements with America for coordinating or exchanging information, or buying arms, or building bases for them, which they will use themselves. But they will not allow the Americans either to station forces there or to do anything else on their soil.

Supposing the Saudis were to face the situation

Bangladesh: What Next?

PARTHA S. GHOSH

DEMOCRACY in Bangladesh, fragile as it was, has given way. On March 23, in a pre-dawn coup Lt-General Hossain Mohammad Ershad has taken over power.

The event as such was not unexpected. Those who have been watching the Dacca political scene for the last few months were almost sure that some such development would take place (see the author's article, *Mainstream*, March 27, 1982). What they probably did not expect was that it would be a completely bloodless coup. But then it is premature to draw comfortable conclusions. There is still room for violence, for everything would depend on what support Ershad musters not only among the people but also among the armed forces.

The coup has raised many questions all of which necessarily cluster around the central theme of political stability. Will the spell of military rule this time be longer? Will Ershad be able to command the loyalty of the majority in the army? Will Bangladeshis who are known for their love for democratic institutions be reconciled to the military regime, and even if they are, for how long? These are some of the questions. Besides, there are such fundamental questions as the role of Islam, which at present is not so pronounced but is not totally insignificant either, in Bangladesh politics. Which of the two trends — populism versus stability — that have been determining the course of events in almost all Islamic countries would be the dominant one in Bangladesh?

To put the matter in perspective, it would be better to discuss the last mentioned first. It is imperative in this regard to analyse the role of Islam in Muslim countries. The political use of religion in these countries has two broad discernible trends. The first represents a situation in which the people have the right of waging a crusade against inefficient and despotic rulers and replace them by an orderly Islamic state. This theory gets its sustenance from the fact that Prophet Muhammad had overthrown a tyrannical system and replaced it by a system which was neither kingship nor rule by aristocracy. In essence it advocates populism and is thus anti-status quo. Ayatollah Khomeini of Iran and Muammar Gaddafi of Libya are embodiments of this trend.

The second trend, which is pro-status quo and in essence a negation of populism, draws implicit inspiration from the Umaayad and Abbasid caliphates of the early Muslim era — the aim being to make social stability rather than social justice the linchpin of state policy. Saudi Arabia and Zia's Pakistan belong to this category.

Bangladesh does not belong to either category, but at the same time there is perceptible evidence of the existence of both trends. The liberation war was an anti-status quo phenomenon in which the freedom fighters had seen the beginning of socio-economic emancipation of the masses. Following independence, this trend was gradually replaced by a stability-oriented tendency which got its expression in the formation of the BAKSAL in early 1975. The BAKSAL (Bangladesh Krishak Sramik Awami League), which was formed by Sheikh Mujibur Rahman by merging the Awami League, the National Awami Party (Muzaffar) and the Communist Party of Bangladesh, was declared to be the only lawful party in the single-party presidential form of state.

The later experiments of Ziaur Rahman, during military rule as well as BNP rule, were also primarily stability-oriented. Despite their different backgrounds there was one common feature in the formation of the BAKSAL and the BNP. Both discouraged dissent while at the same time trying to make the government broadbased. This dichotomy of Bangladesh politics in which pro-status quo forces tend to enlist the support of anti-status quo forces makes it a unique case in the Muslim world and makes an analysis of the situation all the more difficult. The so-called conflict between the concepts of Bengali nationalism and Bangladeshi nationalism also in certain respects springs from the same dichotomy.

Against this background, Ershad probably would have no choice in the long run but to follow the beaten track. Like Ziaur Rahman he will probably have to legitimise his rule by the expedient of a new party. In this regard his relative obscurity will be an asset. It is possible to believe that Ershad will take maximum advantage of this situation, for he is a cool and calculating person. It may be recalled that although Ziaur Rahman was junior to him, Ershad did not mind working under him, probably because he had a larger vision of the shape of things to come. During Zia's time he was one of the few in the army whom the former could really trust. Again, following Zia's assassination, Ershad did not rush to seize power (which would have been easy), possibly because he needed, in the first place, a civilian cover for some time to organise his strategy; and secondly, an alibi which he was sure would be provided soon by a discredited civilian rule. That his strategy has passed the first test is clear from the fact that his takeover has so far gone unopposed. There are unconfirmed reports that he objected to Sattar Government backing out-and-out pro-Pak collaborationists: he disapproved, it is alleged, the release of Khondakar Mushtaq from prison; Khondakar was behind Mujib's killing. Life in Bangladesh in unusually normal. Bangladeshi newspapers have almost unanimously

Dr Ghosh is Visiting Fellow at the Centre for Policy Research, New Delhi.

welcomed the takeover. They all have referred to the lamentable state of affairs arising out of inner squabbles in the BNP.

That Ershad wants to ensure popular support for his rule is already evident. He has said that "our ultimate aim is to reestablish democracy and to hold general elections as soon as possible'. But then, Zia-ul Haq of Pakistan had also said so. The comparison, however, is not valid. Zia-ul Haq and Ershad preside over two different kinds of political situations. In the context of Bangladesh politics one has reason to believe Ershad's commitment about elections from the angle of practical necessity.

In Bangladesh the forces of democracy have reasonably deep roots. It may be emphasised that the democratic movement in the pre-Bangladesh period was virtually an East Pakistani movement. In West Pakistan it was only with the emergence of Z. A. Bhutto that politics reached the masses, while in East Pakistan this was the case from the early fifties. Ershad will find it difficult to violate the democratic ethos of Bangladesh even if he so desires. In all probability Ershad will form his own political party and the lust for power (both the substance and the shadow of it) would make many climb on to the bandwagon.

The immediate task for Ershad, however, is consolidation of his position in the army. The latter in Bangladesh is faction-ridden and highly politicised. Ziaur Rahman was a victim of factional fight within the army. There is no reason to believe that Ershad's coming to power would mean an end to this phenomenon. Prior to the coup there were reports of defiance of his orders by senior army officers.

Laxity in discipline among junior officers in the army is another problem Ershad faces. The putsch of August 15, 1975, in which Mujib was assassinated, was a clear manifestation of this indiscipline. Following that event, the army commanders reportedly faced great difficulty in restoring discipline. During the early phase of Ziaur Rahman's rule several mutinies took place which were quelled with an iron hand and with heavy casualties.

Ershad is reportedly inclined to emulate the Indonesian model, a system largely controlled by generals. Probably he is inspired by the Indonesian army which has provided stability to that country for a reasonably long period. General Suharto's concept of a New Order has its prime focus on "stabilisation" and "development". It is a fact that there is a fundamental similarity between the armies of the two countries. Both have a long record of political involvement dating back to their role in the respective national freedom struggles. But how an imported model will work in Bangladesh is anybody's guess. Moreover, the Indonesian military rulers themselves are facing increasing opposition from the people, particularly the students, in respect of their socio-economic policies.

At the moment Ershad is in full control of the administration. He has dissolved Parliament and the Council of Ministers and suspended the Constitution indefinitely. In his capacity as Chief Martial Law Administrator he has nominated Abdul Mohammad Ahsamuddin Chowdhury, a retired judge of the Supreme Court, a President who will hold office during his pleasure. Following the logic of establishing effective military rule, he has divided the country into five administrative zones and put each under a senior army officer. It may be noted in this connection that one of the charges levelled against President Ayub Khan of Pakistan by his army colleagues was that he had appointed civilian governors to rule the provinces. Ershad does not seem to commit the same error. It is, however, again too early to reach any clear conclusions. On the economic front, Ershad will face the greatest challenge. The country's economy is in utter chaos. If Ershad does not prove effective in arresting the declining trend, even a civil war type of situation cannot be ruled out.

Ershad's Government is called upon to tackle two fronts simultaneously. On the one hand it has to withstand all challenges to its stability and on the other it has to give proper direction to the economy — which is heavily dependent on massive injections of aids and loans of different types — and raise the country from the rather dubious status of being regarded as an international "bread basket." Although the two are essentially interlinked, the latter would depend more on the former than the other way round.

Stability, the key problem of Bangladesh now, also involves the danger of foreign interference. Although there is no evidence of any outside involvement in the recent coup, a prolonged state of political instability might make the country susceptible to foreign interference. Ershad has to be anguard against these forces of destabilisation.

India is naturally worried about the situation in Bangladesh. Prime Minister Indira Gandhi has expressed concern at the frequent convulsions in that country and has said that it is in India's interest that there should be stability and prosperity in Bangladesh. India expects to see a strong and stable Bangladesh under the leadership of Ershad. President Sanjiva Reddy in his message on the occasion of the National Day of Bangladesh greeted Ershad and said that "there has been a decade of close cooperation and friendly relations between India and Bangladesh and I am confident that these ties of friendship and cooperation would further strengthen".

There is no evidence that Ershad has any definite views about Indo-Bangladesh relations, though he has never been an India-baiter. At the moment his chief preoccupation is consolidating his position. Good relations with India will naturally make sense in this context.

Ershad seems to understand that. He has said: "We want to make special emphasis to establish good relations with our neighbouring nations." Recent reports about the Mizo National Front tend to show that he means what he says. It has been reported that about 700 MNF guerillas are shifting from their hideouts near Romabazar in Bangladesh to areas in north Burma fearing that Ershad will not encourage them. One hopes for a positive phase in Indo-Bangladesh relations. □

(*March 29*)

El Salvador: Myths and Realities

R. NARAYANAN

Nobody, including the US Administration, expects that any dramatic change would occur in the tragic course of events currently being witnessed in El Salvador following the national elections held on March 28. Nobody even remotely expects that the outcome of the elections will end either the fighting or the political and economic chaos which over the last thirty months has caused a human toll of thirty thousand Salvadorans. US ambassador Deane Hinton stationed in San Salvador has, more than once, publicly admitted that war will continue regardless of the outcome of the national elections. Predictions based on the counting of votes so far indicate unmistakably that the present junta leader Jose Napolean Duarte's Christian Democratic Party will not obtain a clear majority in the new Constituent Assembly to offer a viable and stable civilian government or avoid the continuing human carnage.

Almost a month ago, however, US President Ronald Reagan in a speech before the Organisation of American States, amid much fanfare, stated that he has "already expressed [his] support for the coming election in El Salvador". He even went further and admitted that "our own country and other American nations ... have urged such a course". There is no denying the fact that the Reagan Administration was very keen on holding the national elections at this juncture even if it was to produce no substantial breakthrough in the current Salvadoran impasse. Equally, the Reagan Administration was aware that the Left parties, including importantly the Democratic Revolutionary Front (FDR), would boycott the national elections. Voter turn-out too was expected to be much less than normal in elections.

Why then was the Reagan Administration, knowing full well that the Salvadoran elections would bring about no change for the better, committed to this otherwise farcical exercise? Aware as it was that the election would be no more than a zero-sum game, why did it opt for this course?

The Reagan Administration's support for a democratically elected government, at this moment, admittedly is a reflection of the near-poverty of imagination of its policy-makers. In a sense, however, it has been forced into playing that card now, obviously because the current struggle in El Salvador leaves open no other course of action for the US Administration.

Escalation to the point of direct military intervention is ill-advised, at least for the time being. As part of the Caribbean Basin Initiative programme, therefore, Reagan had announced massive economic and security assistance to El Salvador. The emergency military aid currently announced by him brings total US military assistance to El Salvador alone to 116 million dollars since January 1981, which, given the present mood of the US Congress, is unlikely to obtain authorisation. House Representative Clarence Long (Democrat; Maryland), head of the sub-committee in charge of foreign aid appropriations and one who led the three Congressional investigating groups to El Salvador, has only recently reiterated what he had said last April regarding a previous aid request: "El Salvador is becoming a bottomless pit for US aid, economic and military". Besides, only a few days ago, the House voted overwhelmingly for a non-binding resolution urging the Administration to push for an unconditional discussion among the major political factions in El Salvador.

Other Representatives, in the course of Congressional hearings, have observed that the Administration's claim of human rights improvements in El Salvador is "a fraud, pure and simple". Testimonies given by the Administration's officials, they claim, are not even convincing in respect of either Cuban or Nicaraguan involvement in the present Salvadoran struggle.

In sum, the Reagan Administration is clearly facing a credibility problem before Congress in regard to its Central American policy.

That apart, many of the United States' European allies, perhaps with the only exception of Britain, as well as the Latin American regimes favourably disposed toward the Reagan Administration, do not see eye to eye with it on its doings and postures in Central America. Categorically, most of them have expressed the imperative need to defuse the Central American crisis, and have indeed shown their willingness even to help negotiations among the different factions. Whatever may be their logic and reasons for disinterest and opposition, the Reagan Administration is doubtless placed in a peculiar bind in terms of stemming the high tide of guerrilla war spreading in Central America which it wants to resolve in the Cold War context.

Under these circumstances, it has become all the more necessary for the US Administration to seek some semblance of legitimacy for the leadership of Duarte. Over the months, the Reagan Administration has painstakingly been projecting Duarte as a "reformist" for whatever economic reforms he had implemented, and just a few days before the election, Reagan had even exonerated Duarte on his regime's human rights violations. The recently heightened rhetorical offensive, including hints of direct military intervention in Nicaragua, was meant not only to support Duarte but to convey discreetly the Administration's confidence in Duarte's leadership.

This is not to suggest that the Reagan Adminis-

Dr Narayanan teaches in the Latin American Studies Division, School of International Studies, Jawaharlal Nehru University.

tration is keen on establishing a civilian government of the Christian Democrats in San Salvador. Far from it. It is unlikely, and the Reagan Administration knows this only too well, that the Christian Democrats would emerge with a clear, strong majority.

A coalition government that encompasses Duarte's Christian Democrats and the National Conciliation, supported by Defence Minister Garcia, along with the rest of the Right-wing moderates, and without Col Roberto d'Aubuisson's National Republican Alliance (ARENA) on the extreme Right, would ideally suit the Reagan administration under the present circumstances. However, his subordination to, if not sharing power with, Garcia who exercises the real control over the armed forces, would make Duarte sufficiently weak and pliable to US influence and manipulations.

At the same time, a diminished Duarte would enable the Salvadoran military to deal even more freely with the rural guerrilla forces whose zones of control now cover approximately one-quarter of the nation's territory. The ensuing fierce and heightened battle in the countryside will offer the Reagan Administration further justification for US military assistance and support, a justification it needs desperately in order to seek the support of Congress as well as the general public. In any event, it would delay further the possibility of a negotiated settlement which its allies in Europe and friends in Latin America are pressing for.

The Reagan Administration's effort so far at portraying the present crisis in Central America as deriving from the Nicaraguan revolution spearheaded and championed by the Soviet Union and Cuba, and as leading, 'domino' fashion, to similar politically destabilising changes in the other countries of the region, has not paid any dividends in the pursuit of its Cold War objectives. It threat-perception of an impending doom, essentially to justify military and economic assistance disproportionate to the actual needs of El Salvador, is not in the least convincing even to the US Congress and the American public.

The return of a civilian and a "reformist" government under these circumstances, admittedly, is welcome. With the elections past and a civilian regime installed, one more card is played. With whatever genuineness that card is played in upholding the democratic rights of the Salvadorans, intrinsically it is not going to resolve the more basic human rights problems of the Salvadorans. (*March 29*)

The Girl who was branded

Mainstream (November 22, 1980 carried an article by Vasudha Dhagamwar, captioned "A Girl called Nandi", a little eight year old girl, who had been branded by a police constable in Cuttack, Orissa. Both Nandi and the constable Nityanand Pande worked as domestics at the house of Reserve Inspector Arakhita Bhera. Nandi was a poor relative of the Inspector. In Behera's absence Mrs Dolly Behera had ordered the constable to brand Nandi as a punishment for playing truant. She was branded eleven times across the buttocks and thighs with the heated handle of an iron ladle.

After a few days, when the pain became unbearable, Nandi went to a doctor in the police lines. Although she pretended that she had slipped and fallen on a hot ladle, the doctor couldn't believe this improbable story — she could hardly have slipped eleven times! He mentioned the matter to Behera. Behera rebuked his wife for getting Nandi go to the doctor and Nandi was once again beaten that night by Dolly Behera.

Next morning the child ran away. She found shelter in the compound of a bungalow which happened to be the house of a High Court Judge K.B. Panda. He had the FIR recorded and saw that proceedings were instituted. All this required considerable perseverence as the IG of police Narsimha Swain, had virtually made it a 'Judge-vs-IG' issue.

For his own safety the Judge moved the girl to a Short Stay Home. Even from there it was not safe for her to go to school like other girls at the Home.

Nandi has been at the home for one and a half years now. She has grown taller, she is no longer as stunted as she used to be. She has learned to read and write and is "reading class three books": She enjoys studying and wants to be educated.

There was considerable police pressure on Nandi not to identify the constable in the dock. Without this identification there can be no case: some constable Pande may have branded her — it had to be proved that the man in the dock is that very person. But Nandi stuck to her guns and identified the Pande.

The Subdivisional Judicial Magistrate of Cuttack gave his judgement in the case in the first week of March 1982. Pande was found guilty of having inflicted simple hurt on the child, and sentenced to one year's rigorous imprisonment. The Beheras were not mentioned in the FIR. So there was no case against them.

Nandi calls herself Gouri now. Her old name means bald-pate, a nickname given because her head had been shaved, because of boils. She has bright-eyes and a confident look.

The SOS villages in Delhi have offered to take Gouri and look after her. This would give her the best possible chance of fulfilling her ambition to be educated.

Here's wishing good luck to this plucky girl, who has made it so far to safety, and education, unlike so many unknowns who surrender to their fates and with dull resigned eyes sink their lives in endless, hopeless drudgery.

Vasudha Dhagamwar

Terror Raj at Magarwara

AMIYA RAO

LATELY, killing of human beings has become almost a pastime. And, in course of time, all reports on such glory events will cease to have any news value; one would come to accept them as normal occurrences as one has accepted the thought of consuming the Australian wheat mixed with the deadly Fenito-therion.

Yet, what happened that freezing night of January 3 in the fertiliser factory of Rallis India in Magarwara, a village in Unnao district of UP, was killing with a difference. It was not quite like the torture and hunting down of politically conscious young men in the jungles or in the silence of jail-cells, or putting bullets through innocent citizens calling then dacoits or pouring centuries old venom on the lowliest of the low in distant villages or even setting ablaze young trusting wives in one-room tenements in the city slums.

This killing or 35 (or more) peaceful sit-in-strikers in Tata Industries was different in more ways than one. It was, first of all, not the doing of a few individuals but the concerted action of the entire State administration. The liquidation of the strikers had been quietly planned and activised by orders to "crush" them, executed with meticulous efficiency and unsurpassed zeal.

It stands out unique, for never before had any killing assumed the significance of a symbol, a pointer to things to come; and Magarwara has become just that — a clear warning to industrial labour that in a dispute between management and labour, labour must bend down to their capitalist masters; in case they go on strike wishing to exert their right to strike the, consequences will be clamping down of ESMA, and even then if the strike continues, Magarwara will be repeated.

Rallis India — one of a group of Tata Industries — had started as a fertiliser factory in 1962 but later converted itself to a chemical industry though its main production is still fertiliser. From all accounts it is a small factory having only 750 employees and producing perhaps an infinitesimal fraction of fertiliser needed by the country. The strike under these circumstances could never have invited the imposition of ESMA, specially when the strikers were peaceful. To use this measure would have been as absurd as to use a bomb to kill a mosquito, to quote a vernacular idiom; and actually it had not. The sit-in-strike had gone on for 15 days without an Ordinance.

The strike had begun on December 14, after proper notification to the management on November 28, that unless some of the demands were met by that date the employees would go on a strike from December 14. The demands included (1) abolition of contract labour system in the factory under which over 400 men out of 750 employees were classified as contract labour earning only Rs 6 a day like bonded labour; and (2) pay parity with other fertiliser workers in IEL in neighbouring Kanpur. Ever since the Unnao Chemical Employees Union had been formed, about nine years ago, unresolved disputes and disagreements with the management have constantly cropped up. In 1979 there were token strikes, hunger-strikes, agitations and demonstrations, and interestingly at that time the Congress(I) was with the Union.

Thus in 1982 it was really the continuation of the same discontent and the management being adamant the strike notice had been served in helpless anger. The Intelligence report refers to the inflexible attitude of Sri Ramachandran the Manager of Rallis India and it held "the management responsible for the conflict", the District Magistrate's efforts to negotiate also had failed because of this adamant attitude. Yet he had not sent any report to the State Government asking it to declare the strike illegal. Thus, when on December 29 the strike was declared illegal, — rather all of a sudden, and without any plausible reason — it became clear if any clarification was needed — who is running this country — the Government elected by the people or the powerful industrialists?

There are some other factors in this affair which add to the distinctiveness of Magarwara killing: first, the behaviour of the press and secondly, the behaviour of AITUC with which the Unnao Chemical Employees Union is affiliated.

Why is the National press completely silent? Why again, this massive black-out of news? Surely we are not going back to the Turkman Gate days even without the declaration of emergency: Could it have been unknown to our national press, who have correspondents in every State capital, that there was a masscre of sit-in-strikers in Rallis India on January 3, and the police atrocities that followed in the surrounding villages? And the place where this occurred was barely 20 km from Kanpur!

Information gathered from different sources confirmed that the SDM had swooped down on the strikers at about 5.30 pm with truck loads of policemen equipped with lathis and teargas and another 150 armed men from the PAC. To get the men out of the factory premises they were first beaten up mercilessly and then teargas shells were used; and when they rushed out they were shot down. Muneswar Singh the fitter fell dead on the spot; Ramnaresh Yadav died of bullet injuries in the hospital; Babulal, an old worker, was dragged out from where he was hiding, beaten up and then left for dead; Akbar, Tariq, Ali Omar, and Ramzan Ali were all pulled out of their homes in the labour colony and severely beaten; then Akbar and Ramzan Ali were thrown into the burning vehicles of the PAC; one eyewitness told us that he saw Akbar twice trying to jump out but he was pushed back to be burnt alive. According to a man at the canteen near the Ganga Bridge, dead bodies loaded in vans were dumped into the river late at night; and the Kanpur-Unnao Road was closed to traffic for several hours.

According to the villagers 100 men are still to be accounted for, it is likely the Ganga has swallowed them. The villages also were not spared; in Dayal Khera village, Chandra Deo a Kanpur college boy was beaten to death; Chhabilal Shukla a worker of Kanpur Ordnance Factory was fatally injured; one Mohan, who was taken for BK Pillai, 'an office bearer of the Union, was shot dead; an old woman, so far not identified, was also shot; to force a woman to tell them where the strikers were hiding themselves they fractured her infant's arm. In the villages 30 people are known to have been killed and 35 have been badly injured; finding huts empty, as many had fled, the police looted them clean.

For three days Magarwara was like an island — cut off from the world outside. The single road which leads to 50 small hamlets was blocked by the police. One can only guess what atrocities must have gone on there, those 48 hours of Police Raj: The entire area was cordoned off and an undeclared curfew was enforced. None was allowed to enter the village; a brief news item appearing in the *Blitz* had mentioned that even Rajeshwar Rao the CPI leader was turned away. George Fernandes of the Lok Dal had addressed a public meeting on January 11 condemning the firing; but not a word about the atrocities appeared in the national press — neither the shooting nor the looting nor the killing of the workers nor the harassment of women was found to have any news value. Obviously, for reasons of their own, these papers have maintained silence about this incident.

If this be the position of the press, what of the CPI? As far as one knows no Press statement was issued by Rajeshwar Rao after he had been denied entry into the village, nor any press conference called by him. The AITUC General Secretary Indrajit Gupta who, one should have thought, would show some concern, is also silent. Why this sphinx-like attitude? There is no report that he had raised the matter in the Lok Sabha. Even in the UP Vidhan Sabha the questions was asked by a Lok-Dal member. Not finding support from their local comrades, some of the union members came to Delhi hoping that the AITUC members would help; but they drew blank.

It is just a week ago, through the initiative of the MP from Dhanbad a memorandum has been sent to the Prime Minister signed by twenty other MPs from different Opposition parties, including the CPI. It is alleged that the trade union leaders are annoyed, because Unnao Union had held on even alter the strike had been declared illegal. But what for was that big to-do in Delhi's boat-club, with slogans and banners and party flags and high-sounding resolutions to fight ESMA and NSA if need be with blood? Magarwara has done just that.

Meanwhile the situation in Magarwara is appalling. Under various sections of the IPC, FIR has been filed against 52 men by name and another 400 unnamed—most of whom either study or work in Kanpur and have nothing whatsoever to do with Rallis India but are residents of Dayalkhera and round about villages. Haji Aslam Colony close to the factory has been burnt down, the Union office has been set on fire, over 200 cycles of the employees have been destroyed, electricity has been disconnected from every house in the village and kerosene being in short supply it is total darkness after night fall, a large contingent of PAC men, occupying about 8 Sq. km area has been posted there, just to terrorise the people. On February 26 there was another spate of arrests, this time of women as well. They had gathered for a condolence meeting for which previous permission had been taken from the ADM and the SP also had been informed. High officers including the ADM and the SP, followed by over 300 police men and immediately joined by another 100 armed police who came out of the factory building, gheraoed the gathering. Nobody can have any doubt now that the administration is with the management. Among the arrested are the General Secretary of the Unnao Union, K.P. Singh and those who had met the ADM and the SP. They were given bail only after six days.

The strike is still on. The fresh demands include (1) Enquiry by a High Court Judge. (2) Compensation to the families whose members have been killed. (3) Employment of the children of the dead. (4) Government take-over of the management of the factory. (5) Restoration of electricity. (6) Withdrawal of the PAC and Section 144 order so that normalcy could prevail.

If these demands are conceded by the UP Government it will be a political victory or the CPI. The UP Home Minister has told the Legislature that it was the strikers who had set fire to the vehicles and would have let out the sulphur dioxide gas to suffocate the police, so they had to open fire in self-defence, but only two were killed. Atleast 35 are known to have been killed, 100 men have not been traced, bodies have not been handed over not even of the 'two'. But Sreemati Swarup Rani Bakshi, the Home Minister of UP has asserted that only two were killed and that must be the truth of the year. □

Locating Roots of Corruption

KAMAL NAYAN KABRA

IT is a part and parcel of our social practice that ideas do not count for their intrinsic worth alone. A substantial difference is made by who happens to uphold and propagate a particular set of ideas. In this context one must offer high appreciation for the seminal contribution made by B.K. Nehru (BKN hereafter) in his lecture: "Roots of Corruption: The All-pervading evil".

At the present juncture, when corruption is no longer a deviant, side phenomenon, but has become an organic part of the system — the biggest working anarchy — one needed a powerful and pointed analysis like the one made by BKN. Essentially his analysis seems to me to proceed as follows: Corruption is so widespread that not only a large number of politicians and ministers are corrupt, but hardly any section of public services is free of this cancer. This leads to abnegation of the rule of law to the disadvantage of the honest and the poor. The welfare measures meant for the poor have been frustrated and no law is enforced adequately.

Coming to the causes of this "all pervading evil", apart from the erosion of values inherent in the process of dynamic change and the ascendence of the power of wealth over everything else, the "principal reason" is stated to be "the political system which we have adopted". For, it "cannot exist without large-scale expenditure." A good many illustrations are given to drive home the point that since "no political party can afford to finance the entire expenditure" on elections, recourse has to be had to "larger political contributors". As a result, "the system has tended to degenerate into a more direct relationship between the money contributed and the favour granted". So firmly established has this "democratic culture" become that "not even *the most powerful leader* can stop the advance of corruption." (emphasis added).

The argument concerning the political system's principal place in the genesis and avalanching of corruption is followed by describing the details of how party contributions are turned into personal property and prerogative, and the new crop of politicians whose interests are anything but what is constitutionally expected of them. No wonder if "in one particular State no less than 30 per cent of the legislators are involved in criminal cases of one type or another". How the political system has degenerated into one of sharing spoils of power is described in detail. The impact of this system on the civil services is also pointed out, particularly in view of the fact that "the temptation to corruption is of course enormous" in view of the "ludicrous" level of salaries in real terms, particularly at higher levels.

The author is Professor of Economics, Indian Institute of Public Administration, New Delhi. In this article Prof. Kabra looks critically at the points made by B.K. Nehru, Governor of Jammu and Kashmir, in his G.L. Mehta Memorial Lecture at Madras on December 22, 1981.

BKN dismisses the glib talk of "moral revolution" for dealing with rampant corruption as question-begging; hence "root-and-branch reform" in the political and constitutional structure is suggested. The essentials of the alternative democratic system suggested are: indirect proportional representation system through various electoral colleges from village, city, district, State upwards to Parliament. This will reduce the need for money, introduce greater personal acquaintance between the candidates and their electorate, and make elections centre on issues of policy.

The most far-reaching change suggested is "a total separation between the executive and the legislative powers", so that the latter "have no say either in electing or keeping in power the Chief Executive", with a fixed tenure of one term and thus making him (or her) impervious to unpopularity incurred while in office. Since direct elections bring in money power, the second best solution of indirect elections with a certain size of regional votes as imperative are recommended. One wonders how else one would define the presidential system.

Certain other reforms concerning civil services, like taking their promotion, suspension, transfers, etc., away from the Chief Executive and hefty pay rises, reforms in the sphere of the judiciary and implementation of controls according to well-settled norms have also been suggested in BKN's thesis. Finally, a thorough discussion of such issues is advocated.

Evidently, it is a serious exercise and must be considered very carefully. Indeed, BKN's thesis has received well-deserved widespread attention. Many a critique of it has already appeared. I propose to examine some of its basic propositions, because, given these basic premises concerning the phenomenon of corruption, one may well infer some of the suggestions advanced. However, it must also be admitted that the major thesis (that is, indirect elections and a chief executive independent of the legislature), does not necessarily follow, even if one is prepared to go along with the diagnosis of the nature and causes of corruption as given by BKN.

In identifying the political and public functionaries as the major elements of the corrupt system, to a certain extent the corrective suggestions are prepacked in the diagnosis itself. True, the processes of dynamic post-Independence changes and their unsettling impact on values have been mentioned. What is the character of this dynamic process of change? Is it not, in the so-called mixed economy dispensation, a powerful, state-sponsored and supported process of making the rich, the powerful and the organised the main agents and beneficiaries of growth? True, a number of correctives embedded in plans, policies, laws. etc., were visualised and initiated to ensure a definite directional flow of their trickle-down and spread effects. But these exercises were made purely technocratic and bottom-up ones, with no mass mobilisation politics and no chopping off of the dizzy heights in order to ensure weight and voice to the lower rungs.

BKN does not seem to be unaware of it all, when he recognises that "our admirable post-Independence record of legislation for the benefit of the common man has benefited him only peripherally for it has not been fully implemented."

Why this poor implementation? Given the size of the cake and the process of its growth, if the poor succeeded in getting their legislated due, who would have had to for go this portion? Certainly no society redistributes in favour of one set of people without depriving some other set of the portion earmarked for redistribution. If the failures in reaching the benefits to the poor and the *downtrodden* were managerial and administrative failures, arising out of incompetence and inadequacy of skills, they cannot certainly be attributed to corruption. But if these failures are attributed to corruption, as surely BKN does in mentioning it as a consequence of corruption, then obviously those who gained through plugging these redistributive channels had a motivation and a hand in causing this corruption.

Were politicians and civil servants the sole beneficiaries of the opening of the *flood gates* of corruption? BKN does not stop with the erosion of values arising in a dynamic society. He makes a pointed reference to the role of wealth. To quote: "Status and function today increasingly depend on the possession of wealth: whence the mad rush for money." Now, politicians and civil servants can only share wealth, they can only have a cut. But prior to that, wealth must be produced and must get concentrated in the hands of some groups and individuals who, through corruption, share it with the political and administrative authorities for the help and protection they seek and receive.

The basic constitutional and systemic choices left the processes of private aggrandisement intact. Planning and related policies had a dual role. Partly they lent support to these processes. But partly they sought to control and regulate, modify and moderate, these processes, so that stark poverty is reduced and some evening out takes place. It is mainly in response to this latter course that one finds the eruption of corruption as a major device for letting the market rates of return reign and line the pockets of those who had a head start. The politicians and civil servants played their part, but as minions bringing about a divorce between the real and the hidden power on the one hand and the apparent and the formal power on the other.

It is native to believe that those who bribed were the minor beneficiaries and those who received the bribes, cuts, commissions, on-money, hush-money, or donations and contributions, privately or publicly, (through trusts and souvenirs) were the major beneficiaries in any meaningful, quantitative sense.

Here let us go back to what the Monopolies Inquiry Commission and the Santhanam Committee on the prevention of corruption said. The former wrote, "The considerable assistance that some of the leading industrialists in the country had given to the ruling party from time to time has furnished ammunition for the attack that big business is hand-in-glove with the party in power." Further, "But people cannot be blamed if they believe that it is the hope of favours that induces such payments and after the election is over, businessmen try their best to see that the 'investment' made by them bring satisfactory results." If contribution to the ruling party is an 'investment' with handsome returns, the 'economic system' will go all out to make it. As the Santhanam Committee put it, "...Willingness and capacity to corrupt is found in a large measure in the industrial and commercial classes. The ranks of these classes have been swelled by the speculators of the War period. To these, corruption is not only an easy method to secure large unearned profits but also the necessary means to enable them to be in a position to pursue their vocations or retain their position among their competitors." That was the view in 1964. Since then, investment in the business of politics has been "perfected" and strengthened manifold.

Thus, in picking up the political system as the "principal reason" for the all-pervading evil of corruption, BKN either gives the term 'political system' such an all-embracing interpretation that the system of private, inherently centralising and concentrating, property ownership and enterprise is also a part of the political system (the latter permits and legitimises the former), or his emphasis is misplaced.

True, parliamentary and assembly elections are very expensive. But is it entirely owing to the sprawling size of the constituencies and the large number of voters? What about the content, form, levels and methods of articulation of the general and specific interests of the poor masses, the masses who are poor not only in terms of material well-being (the product, largely, of the economic system, in so far as one can speak of the 'economic' and the 'political' separately) but also in terms of consciousness and political mobilisation (the product, largely, of the political system with the same caveat as the preceding)?

It is not our contention that BKN is not aware of these considerations. He goes on to the question of financing elections and refers to the role of the "large political contributors". But the matter is left at such a polite and vague level of allusion. The remedies suggested by BKN have to bear the burden of this polite but significant omission. The corruptibility of the politicians is simply made a function of the need to finance elections, though it is recognised that the days of party-level contributions are almost over, as they are rapidly transformed into "contributions to one's own welfare." However, it

(*Continued on page 34*)

Perspective for Non-alignment

A.K. DAMODARAN

THE two decades since the Belgrade Conference have witnessed qualitative changes in the international system. These changes have been reflected in the relative status, importance and effectiveness of the non aligned countries. It is a mixed record as it is bound to be in a period of unprecedented complexity in strategic, economic and purely political issues in the relations between competing forces and pressure groups within the states and between the various institutional and semi-institutional groups of states which have come into existence on a functional, regional, ideological or conventional strategic basis during this period.

The Non-aligned Movement is only one of many such groups. Its membership coincides to a large extent with the total membership of the various regional organisations of the developing world. There are, also, non-conformist countries in either ideological group who have sought a certain identity in the Non-aligned Movement without giving up essential loyalties to their original ideological fraternities. The Organisation of African Unity, the Arab League and the ASEAN are examples of regional groups which find no contradiction in merging their regional interests in the larger expectations of the developing world.

In the case of Latin American countries, the position is more complicated. Individual countries are attracted by the concept of non-alignment which would give them a certain real or illusory defence against the influence of the United States. As a group, however, the Latin American countries who became formally independent long before the new era of decolonisation which led to the emergence of the contemporary Non-aligned Movement and which had enjoyed *de facto* sovereignty without very real control over their economic resources throughout the 19th century and in the first half of the 20th century, were anxious to have only a partial association with non-alignment; racial, cultural and religious links with Europe inhibited the need for cooperation with the newly independent countries.

This predicament is not limited to Latin America. Conceptually, the self-images of the Ethiopia of Haile Selassie's time, Thailand, Afghanistan before the Saur Revolution and even Nepal, are different from those of the more conventional newly independent countries like India and Indonesia, which had a total experience of colonialism for more than a century and also the experience of successfully waging an anti-colonial struggle. Countries like North Korea, Vietnam, Saudi Arabia, Iran before the fall of the Shah and Malawi would be examples of nation-states with strong ideological convictions who do not find any contradiction between the philosophies which govern their political organisation and their membership of the Non-aligned Movement.

All this has resulted in an enormous increase in membership between 1961 and 1981. Almost all the countries which have become independent since the Belgrade meeting have opted for membership of the Non-aligned Movement. In fact, there has been no country which has denied itself the advantages of such membership. Only one country has decided to withdraw formally from membership, Burma. This is, of course, a unique achievement and has led to justifiable self-questioning about the reality of the achievement. There is a feeling, for example, that this increase in membership has been at the expense of the rigid criteria laid down at Belgrade. There is also the feeling that the Non-aligned Movement has become more and more in effectual in bringing about minimum changes in the decision-making process which is controlled by the great powers on political, economic and security issues. It is suggested that while this may be true, it is also not exactly relevant. Never during its history before and after institutionalisation did non-alignment see itself or project itself as an alternative decision-making body. It has been functioning all along within the global institutions created after the end of the Second World War by the victor nations and thrown open later, as historical developments demanded, to the newly independent colonies and the countries defeated in the World War.

During this whole period, the Non-aligned Movement was mostly effective as a sustained campaigner for disarmament, decolonisation and the creation of a more just international economic arrangement. This campaign was waged within the limits of the United Nations and its specialised agencies, within the accepted norms of general International Law which give a vast area of manoeuvre to the nation-states and within the framework of the antagonism between the ideological-cum-strategic blocs across the North Atlantic and North Pacific which emerged in the immediate aftermath of the war. The story of decolonisation is the story of the United Nations slowly going along with the political realities within the old empires which had outlived their utility in their limited forms. The campaign has different tempos, accelerated paces sometimes, total stagnation sometimes and a generally steady pace in the case of British decolonisation during the last 35 years.

The Non-aligned Movement was a prime catalyst in precipitating this process, but it did not cause it; the causes were in the minds of men in the different

The author is a former diplomat. This contribution is based on a paper he presented at an India-Indonesia seminar (January 26-29, 1982) organised in New Delhi by the Institute of Defence Studies and Analyses in collaboration with its counterpart in Jakarta.

colonies. We should not, therefore, exaggerate the historical strength of non-alignment even in the earlier period. It has been the intelligent and sophisticated use of limited power with the skills acquired from the experience of anti-colonial struggle that enabled countries like India, Indonesia, Yugoslavia, Egypt and Ghana to lead the campaign for universal decolonisation. When compared with this achievement in the early years, the achievements of our times appear to be not so clear or concrete; but they are equally important. The important thing is that the methodology and the environmental realities accepted by the opponents of the establishment continue to be the same.

Also, at no time did the Non-aligned Movement have a total solidarity of outlook or ideology. In the first 25 countries which met in Belgrade, there was a variety in internal ideology and external attitudes, ranging from Saudi Arabia, Morocco and Ethiopia to Congo (Leopoldville), Cambodia and Cuba. This variety did not prevent many agreed decisions from emerging. At the same time, the proceedings of the Belgrade Conference brought out formally wide differences on problems like the relative importance of decolonisation and prevention of nuclear war even amongst the original founder members — India, Indonesia, Yugoslavia and Egypt.

This look backwards is not intended to minimise the seriousness of the differences within a much larger membership today. It would be undesirable as well as unwise to ignore them. There is, however, no reason to exaggerate them out of all proportion. Over twenty years, we have learnt to co-exist with these differences and managed to keep on functioning with a certain amount of effectiveness.

II

THE motivation and the power to influence world developments of the Non-aligned Movement is, however, only marginal. As a group and as individual countries, they are only reacting to major developments in the relations between the great powers. The last five years have seen a gradual increase of tension, first political and later strategic, between East and West, which has had its origins in their perception of their respective strategic interests. In the more important sectors of the area of divergence, the differences originate in the [redacted] profoundly influenced their economies, their political stability and their strategic vulnerability.

Within the Non-aligned Movement itself, there have been two developments, which have led to intensification of the East-West conflict with its essentially European origin. Firstly, there has been the Arab-Israeli problem which is unique since it is the result of the intrusion into Asia, into the developing world, into the newly independent countries, of a European historical tragedy, which has inevitably assumed the shape of a contemporary neo-colonialist phenomenon. Developing its own momentum because of the geological accident of the concentration of such a large portion of the world's hydrocarbons in this area, the Arab-Israeli dispute gave an opportunity to some non-aligned countries to use the classic instruments of imperialist persuasion or coercion against the "industrial democracies". This is the story of the energy crisis. Here, we get an intersection of two active, powerful, and entirely separate influences wrestling with each other.

The second development is equally significant. In Africa and in Latin America, during the last five years, new tensions have been created by the problems of delayed decolonisation by Portugal and intervention and counter-intervention by the great ideological groupings. It is the same need to protect one's own ideology or influence by either side that has been responsible for the unfortunate developments in some non-aligned countries in Asia. Afghanistan and Kampuchea have very specific objective, domestic reasons for their "present discontents": but what has given stamina to the protagonists in the two struggles, stiffened their determination to fight and prolonged the agony, is the linkage between these local conflicts and great-power antagonism.

Whatever might be the precise origin of various conflicts, central or peripheral, between the two great ideological and strategic systems, the most relevant fact for us in the non-aligned world is that we have to learn to function in a much more inclement atmosphere than even a mere decade ago. There was, quite recently, a rather fashionable idea that detente between the big powers meant less initiative and less capacity for initiating action for the non-aligned countries. It is a rather populist version of the older Chinese picture of the two world powers alternatively contending and colluding. In such a two decades. A new era of tensions was unwelcome to poor societies trying to get immediate support for their developmental programmes from the richer countries.

During the last two years, the situation has deteriorated dramatically. We are now in the midst of a new cold war. Old tensions are being revived in different parts of the world and the more recent tensions like the ones in South-East Asia, South-West Asia and Central America are being kept alive and intensified. There seems to be no realistic prospect, today, of the non-aligned countries profiting from all this, no likelihood, say, for an 'honest broker' role between gigantic adversaries or their surrogates. More than anyone else, we have a stake in detente.

III

A BRIEF survey of global developments in the last five years would illustrate these conclusions. The problem of decolonisation in its purely political aspect has now been almost completely solved. Apart from Namibia and freakish cases like Hongkong, the process of national liberation and self-determination has been almost completed. The central role played by the Non-aligned Movement within the United Nations and outside in speeding up decolonisation was clearly demonstrated in Zimbabwe.

The actual liberation of the former colony was the result of negotiations with the ruling power as had happened in earlier British instances. The difference in this case was that for a long period the members of the Non-aligned Movement took an active interest in the Southern Rhodesian problem and contributed in an ever-increasing measure to the liberation process both politically and in material support to the liberation struggle. In fact, the sixties and the seventies saw the emergence of a new alliance being forged between the newly independent countries, the progressive elements in the capitalist world ranging from liberals to socialists or from militant Marxists to clerical activists and the socialist countries. This alliance sustained and encouraged the physical struggle waged on the ground in Zimbabwe itself with support from the frontline states. It would be recalled that the previous phase of decolonisation in the middle seventies which had followed a domestic change in Portugal had also been assisted by the national liberation struggles in Mozambique and Angola. More specifically, the Organisation of African Unity took a leading role in canvassing support for the struggle in Zimbabwe which was actually waged by militant nationalists with logistical support from Tanzania and Zambia.

Apart from Namibia in Africa, where also this mix of conference diplomacy and guerilla warfare seems to be working towards a similar conclusion, the other purely colonial problems are limited to a few French settlements and colonies overseas, which have survived because of the peculiarities of France's constitutional arrangements, like Cayenne in Latin America, Reunion in the Indian Ocean and some Pacific and Caribbean Islands. Their size or significance, however, does not detract from the general conclusion that the age of the older political-cum-military colonialism is ended.

As someone said, every solution has its own problem. The newly liberated countries have now to face the problems of neo-colonialism in all its aspects, facing the bitter choice between conformity to big-power interests or economic stagnation or even retrogression and consequent political instability. The role of the Non-aligned Movement in its second twenty years will necessarily be more concerned with the identification of these new dangers and the devising of new methods to counter them.

There are some countries which necessarily do not fit into this analysis. Any investigation of colonialism in its contemporary phase has also to take into account the exceptional cases of Israel, South Africa and Taiwan. We have already discussed the specific problem of Israel but what has to be noted is its continuing and increasing aggressiveness. Because of the absolutely predictable, passive reaction from the United States and the absence of any reprisals of any kind from the other powerful nations of the world belonging to either ideological bloc, Israel has consistently flouted canons of International Law in general and specific modern agreements including the UN Charter in particular. It has proceeded on the assumption that safety or survival for it in its immediate strategic environment can only be ensured from a position of total military superiority over its unfriendly neighbours. The Israeli problem is thus one of the surviving links of the old imperialist pattern and the non-aligned countries have today fewer dilemmas than in the past in opposing it. In the sixties, there were many African non-aligned countries which were neutral in this conflict. Today there are very few. After the Golan Heights annexation, it is the non-aligned countries in the Security Council that have taken the initiative in demanding sanctions against Israel.

Equally unambiguous is the position of South Africa with its doctrine of racial superiority and permanent minority rule. Resolutions on apartheid and racial discrimination in South Africa have been some of the most widely accepted and non-controversial items in non-aligned conferences. Today, a new danger has been added to the role of South Africa by a clear change of attitude on the part of the new US Administration which sees in this Southern Indian Ocean and South Atlantic power, a possible ally in a new round of naval competition with the Soviet Union. Taiwan is a much simpler matter. Most non-aligned countries endorse Beijing's claim. Some few, who recognise Taiwan, would also endorse the concept that there is only one China. Here again, it is the new US Administration which has made a fairly conventional issue a live one.

The problem of old-fashioned colonialism is, therefore, important only in these exceptional cases. The role of the Non-aligned Movement will always be there as a vigilant guardian of the autonomy and sovereignty of the smaller and weaker countries, but it would not be unfair to conclude that the problem is not one of the future but one of the past. It is to the more contemporary version of colonialism in its subtler forms, political, economic and cultural, that we should address ourselves to appreciate the relevance of the Non-aligned Movement in today's world.

IV

THE most important and urgent of the problems which face individual non-aligned countries today are those concerning security. Any threat to the security of a nation-state in the developing world can be the result of linkage with incipient or actual conflicts between the super-powers or some big powers, or on the more familiar pattern of inter-state conflicts due to conventional causes like territorial disputes, border infringements, blurred ethnic loyalties, etc. All three types of insecurity can logically give rise to various forms of intervention by one state in another. The Non-aligned Movement has a role to play in containing and limiting the extent of these conflicts; it has not the capacity to solve them, but it can do a great deal in a negative fashion by refusing encouragement to the aggressor and mustering support in the world for the weak against the misdeeds of the strong.

Patterns of insecurity are, however, not limited to external danger. Because of the special circumstances obtaining in developing societies, because of the transitional problems involved in the incomplete change from feudalism to a modern industrial society, and from tribalism to an integrated nationstate, there are several internal problems produced by inadequate change or insufficient tempo of change. These also lead to changes of regime and to violent upheavals which spill over traditional borders. One near-universal phenomenon in the post-colonial age is the unsatisfactory nature of state borders. International Law, derived as it is from the age of imperialism, sanctified territorial changes by conquest. The arrangements after the Second World War are predicated on the assumption that no further changes would be allowed in a nation system controlled by the UN Security Council. Many of these arbitrary conventions have no real meaning for shepherds and cattle-herds who continue to move about with their livestock across modern frontiers. They would have to be carefully observed and imaginatively interpreted if unnecessary conflicts are to be avoided. These are much more complex problems than the easier colonial problems like Goa, West Irian, etc.

There are numerous examples today of conflicts of all the three types mentioned earlier. The continuing difficulties in Angola due to Namibia-based mercenaries, the trouble in the Horn of Africa between Somalia and Ethiopia, the difficulties between different groups in Chad and their patron states, the complex situation in Western Sahara and the residuary problem of Mayotte in the Comoros are examples of conflicts on the territories of non-aligned countries and between them, which are supported and encouraged by super-powers or the big powers. Specific examples of intervention by the super-powers can be noticed in Latin America and most recently in Afghanistan. The Chinese "punishment" of Vietnam is also linked with these instances in all of which a 'major' power is involved.

A specific example of a more direct bilateral conflict between non-aligned countries in which super-power interest is absent or at the most implicit can be found in the Iran Iraq conflict. The "intervention" by Tanzania in Uganda and by Vietnam in Kampuchea are analytically interesting because of the divergent reaction they produced in the world outside. The African episode was permitted to sort itself out not without a great deal of suffering because there were no specific great-power interests on either side. The Kampuchean problem is kept alive because not only are the regional states interested but also China and the great powers.

In all these cases, the non-aligned countries have a mediatory role which they can perform if the circumstances are congenial They can do it most naturally through existing regional organisations or ideological groupings like the Islamic Conference. They certainly cannot achieve anything by excluding them. Following a pattern established by the UN in the major conflicts of the last thirty years, it should be possible more and more for the Non-aligned Movement to take an activist role by forming peace forces as the OAU is trying to do in Chad or by a major diplomatic effort to find a compromise solution as they are attempting to do in the Iran-Iraq conflict. Even in difficult problems like Afghanistan and Kampuchea; the non-aligned nations have to go on plugging away at a political solution in preference to a military one.

All this is satisfactory enough, but neither the world system as a whole nor its non-aligned members have as yet found a solution to help the evolution of existing nation-states into more progressive, just and egalitarian models. This problem can be tackled more by crisis prevention than by crisis management. This means a much more intensive role for the Movement in the diplomacy of peaceful co-existence and economic co-operation among the non-aligned countries themselves and also in the multi-faceted co-operation between the developed and the developing countries.

V

THE campaign for the new economic order began on a formal basis with a programme of action launched at Lusaka in 1970. The next decade saw a certain maturity and sophistication in forming the campaign; results were, however, inevitably postponed by the energy crisis and the consequent disarray in domestic markets and in the international system. As the crisis developed, it became clear that the worst sufferers had been the most vulnerable, that is, the developing nations. It also made clear that apart from the earlier regional and national differences in the movement, there had now emerged a marked distinction between the direct beneficiaries of the petroleum scarcity and the most affected, least developed, oil importing countries. In between, there was a whole range of countries succeeding in somehow meeting the problem by economic developments over which they had no control, but which were useful to them, like the price increase in many cash crops and the new major factor of the remittances coming into the exchequers of labour-exporting countries. The developed countries were, after the first shock, not very much affected, mainly because of the recycling process.

The energy crisis came at the end of a 10-year-old campaign within the UN for more equitable terms of trade. The UNCTAD conferences and the sustained campaign in all UNCTAD subsidiary agencies by the Group of 77, represented the actual political power of non-alignment expressed institutionally. Outside the UN, in the crisis years after 1973, there came into being the independent North-South dialogue, which after the first semi-success at Paris has now gone on to a fresh start after the Brandt Report and the Cancun Summit. This is the area in which non-alignment has been most vociferous as a movement; however, we should realise our limitations. Much of the lobbying has to be done in existing institutions, like the Commonwealth, the Lome Convention meetings, and the UN Economic Conferences, both ordinary and special. More important, speeches at non aligned meetings should not become a rhetorical substitute for effective action through continuous diplomacy in New York and Geneva. It is also useful to remember that, as far as the crucial problem of collective self-reliance is concerned, the "non-aligned countries" are indistinguishable from the "Third World" or "developing countries". Earlier in the seventies, there was still some political sense in emphasising this distinction, depending upon which side a country belonged to. With the entry of countries like Pakistan into the non-aligned world, this distinction has lost all its significance.

Collective self-reliance in practice means increased cooperation, technical as well as administrative, between developing countries. The idea is to arrive at the maximum possible commonality of interest between the various countries, making allowances for special cases. Collective self-reliance is based upon the idea that our countries are fully functioning and responsible members of the existing systems, trying to change them by sophisticated diplomacy, if possible, and collective strength derived from the solidarity of the weak, if necessary, There is no unrealistic or confrontationist programme envisaged.

The economic independence of our countries is linked with cultural and intellectual independence. The links which elites in our countries continue to have with the old metropolitan powers have to be slackened, if not severed, and replaced by new links based on natural geographical factors. This is what is meant by the fight against neo-colonialism, It cannot be done on too simplistic a basis. Multinationals do perform a function in our imperfect society. They transfer technology in an efficient and rapid manner through tried institutions. Things can go wrong when the recipient country does not have the administrative experience, technological expertise or high political traditions of personal integrity in leadership, to ensure the maximum benefit of such a transfer of technology. It is necessary to fill this vacuum most appropriately by representatives and experts from similarly situated countries which are familiar with failures at home and who can appreciate the relevance of appropriate technology. Interventionist activity by the aid-giving power based on idealistic notions of social justice, anti-elitism and the attempt to incorporate a "basic needs" approach are suspect in the Third World as refined neo-colonialism either directly by the government concerned or through the transnationals.

Technical cooperation between developing countries should begin by supplementing existing links and, as the process becomes successful, take up a commanding position. It is not intended to be a substitute for useful relationships with developed countries or with efficient, self-reliant technology within the country concerned.

The same principles would apply, with equal relevance, to the exchange of technology, information and culture. In all these cases, it is the non-aligned countries which can help each other much more than the developed world. They would be less biased and more acceptable as partners to the weaker countries in the movement.

The immediate prospects of economic progress for our countries are bleak. The great Western nations are passing through a period of deep self-questioning and doubt. Economic theories accepted for the last four decades are being thrown out and replaced by dangerous doctrines which are most unkind to the most feeble. The Cancun Summit was institutionally anything but a success, but it did succeed in making President Reagan with his definite ideas of monetarism and supply side economics understand a little better the realities of the Third World. It is also meant that several of the other leaders of the industrialised West became more aware than before about our problems. It would be necessary during the next decade to convert these vague sentiments into hard economic action to benefit the poorer countries.

A connected problem is the role which can and should be played by the Socialist countries in the North-South dialogue. On the great political and strategic questions of our time, the Socialist countries have on the whole been on the side of the non-aligned world, though there have been some exceptions. They have been for decolonisation and against the neo-colonialist danger. For some time, however, they have become marginal or irrelevant to the North-South dialogue by their own choice. Their help is there but only on a limited bilateral basis. It would be one of the major tasks of the Non-aligned Movement to persuade the Soviet Union and its Socialist allies to take up a more active role in the negotiations between the rich and the poor.

In this particular context, China has also to play an important role. It has begun by asserting its identity as a Third World country. It has also behaved differently from the European Socialist countries by seeking membership and the available facilities in the world monetary institutions. In future discussions on a global level, China could play a positive role on the side of the non-aligned countries.

VI

DURING the next two decades not merely the Third World but the First and Second Worlds also will face economic and political challenges requiring organised effort on the part of individual nations as well as international organisations and movements. The concept of non-alignment arose from the feeling of newly-independent countries that without complete autonomy in economic activity and freedom from external intervention, it would not be possible for them to rediscover their lost identity as peoples. It was only gradually that these countries became aware of the need for acting as a movement within the framework of the international system with its hierarchy, with its definite apportionment of rights and duties and with its concentration of the decision-making power in a small number of countries. The effectiveness of united action in moments of crisis and peril was very early demonstrated during the Dutch Indonesian crisis in 1949. There have been many such experiences since them, the most recent being in Zimbabwe.

Today, there is no uncertainty at all about the *need* or the *role* of the Non-aligned Movement. It is necessary for supplementing, and amending also, the existing international order. Its function should be to educate first its own members and then the great countries of the world to the dangers inherent in an unequally organised world, for all countries, rich and small. Inter-dependence is a basic fact of international affairs today and, as the organised expression of the aspirations of a very large group among the countries of the world, the Non-aligned Movement has a specific role. The agenda of the Non-aligned Movement during the last years of the century derives from this role and begins inevitably with the linked programmes of disarmament and development. Resistance to such a programme is bound to come from vested interests in the powerful countries. It would, therefore, be necessary to carry on a campaign for this purpose within the existing security system of the United Nations in which the Security Council and the General Assembly play differentiated and supplementary roles. One of the objects of the campaign should be to democratise the world structure in a form acceptable to the custodians of authority. Parallel to this campaign for a more democratic international security system should be a campaign for a new economic order which also will have to function within the system.

For both these aims, what is essential is discussion, dialogue, and intelligent co-operation among the non-aligned countries. This is the essence of what is now beginning to be known as the South-South dialogue. The North-South dialogue is at the heart of the modern economic problem. The South-South discussions should be considered an essential element in our preparation for conducting that dialogue on a more equal basis. Another item of equal importance on the agenda of the Movement during the coming years would be a new look at the possibility of a South-East dialogue. The Socialist countries should be persuaded to play a more active part in the decision-making process in the world monetary system and help the developing countries from within rather than assume an attitude of detachment.

These are the major global issues of our time in which the Non-aligned Movement has a decisive contribution to make. An intelligent awareness of these great global issues should, however, not make us forget the more urgent role of non-alignment as a defusing instrument in the immediate security crisis of the day. In the Arab-Israeli dispute, in the unresolved crises in South-West Asia and South-East Asia, the Non-aligned Movement can exercise a positive, but not necessarily decisive, influence. As a movement, it has to be realistic and not be tempted into taking extreme rhetorical positions. For example, we have to build upon the reality of the Israeli state as well as the Palestine people's right to have a sovereign state of their own, in prescribing an optimal solution for the problem in the Middle East. In Southern Africa, the economic dependence of eight African countries on South Africa is also a fact which cannot be wished away, while we exercise all possible pressures, legal, moral,

Arms Race and Poverty

WORLD TODAY

- World's annual military expenditure=$ 500 billion =Rs. 4500,000,000,000 ($ 1.3 billion per day.)
- Number of under-nourished and hungry: 1000 million.
- Number of destitutes: 800 million.
- People who have no access to medicine: 1500 million.
- UNICEF estimate: 12 million children below the age of 5 died of hunger in 1978.
- Population of poverty belt areas: 1215 million. Fifty per cent of them live in absolute poverty.
- Children who do not go to school: 250 million.
- Number of illiterates: 800 million.
- India, Indonesia, Bangladesh and Pakistan contain two-thirds of the poor.
- Absolute poor in Latin America: 100 million.

INDIA

- Military expenditure 1982-83. Rs 5100 crores; Rs. 70.50 per head per year.
- Largest arms importing country in South Asia. Arms import from USSR amounted 70 per cent in 1970-74 and about 57 per cent in 1975-79. Rs. 4000 crores have been kept abroad for purchase of defence equipment.
- People living below poverty line: 35 crores.
- People at marginal level of poverty: 20 crores.
- 50 lakh people are drawn below poverty line every year.
- 43 per cent of the absolute poor of 36 countries live in India.
- Unemployment is highest; about 2 crores working man-years.
- Growth index is lowest.

—*Released by India Library Institute, Calcutta.*

political and economic, on the Republic of South Africa to give up its undemocratic, uncivilised and irrational principles of political organisation. Only the Non-aligned Movement can, by utilising its very diversity and the existence of widely divergent approaches, come out with a solution which could bring about immediate redress to the victims of apartheid in South Africa and at the same time be acceptable to the Western nations which are friendly to the Pretoria regime. Such dilemmas are present in most of the other crises also. It should be possible for non-alignment to attempt to solve these problems, or at least, when that does not appear to be feasible in the foreseeable future, at least mitigate them. It is only when all attempts through conference diplomacy, bilateral discussions and public campaigns fail, should the small nations take to the path of confrontation. In doing so, they will be able to depend not only upon themselves but also upon progressive elements in other parts of the world.

These elements include the uncommitted neutral nations of the developed world like the Scandinavian nations, and powerful liberal groups within the Western military alliance. On many issues, it would also be possible to count on the co-operation of the Socialist countries. The recent unilateral disarmament movement in Western Europe and the developments in Poland indicate that the opinions of the large majority of the populations in a country need not necessarily follow the pressure groups and the narrow interests represented in the ruling elites. This is, of course, true of the members of the Non-aligned Movement also. It is only by taking into account all such possible allies in our campaign for political independence, guaranteed national security and economic justice that we can succeed in the realisation of our aims.

VII

THE above survey shows that the Non-aligned Movement, in spite of some of its difficulties and problems, has an important political and significant economic role in the world today. It provides security and a substitute for defence for the very weak in a world where strength is unfortunately decisive. It also provides through time-tested instruments of solidarity and self-reliance, an opportunity for the newly-independent countries to claim a greater share in decision-making, at the global level. It also provides through summit conferences, the meetings of the foreign ministers in between summits and at meetings of the Bureau, a certain continuity of action on issues important to our countries. Still greater continuity is provided by the regular meetings in the UN capitals and by the groups of non-aligned representatives attached to the functional bodies in the UN framework. All this makes the existence of a secretariat perhaps unnecessary. In political and strategic matters a secretariat would really be something of a nuisance because it could be used by the incumbent leadership to influence policy more than to a fair extent. The hard inevitable work necessary in economic and connected negotiations could perhaps be better performed by the institutes or organisations of non-aligned experts who could provide the smaller countries with the necessary negotiating skills, factual information and expertise in advocacy which they themselves may lack. It is in these rather prosaic areas of detailed functioning that the Non-aligned Movement would be able to be more inventive in the immediate future so that it can carry out its role more effectively and meaningfully than it is doing today. □

Sikhs in Secular India

K.S. DUGGAL

SECULARISM is defined variously by various people. However, it is certainly not "rejection of all forms of religious faith". As understood by us in secular India, it consists in equal respect for all religions.

Mahatma Gandhi, father of the nation, was a staunch Hindu and yet he studied and venerated other religions whose hymns were regularly recited at his prayer meetings. These included Buddhism, Jainism, Christianity, Islam, Zoroastrianism and Sikhism. Jawaharlal Nehru professed himself a non-believer and yet he visited places of worship with the apparent devotion of his countrymen. He was invested with the sacred thread as a child and Vedic ceremonials were duly observed at his cremation. Indira Gandhi's spiritual thirst carries her to wherever she can find peace of mind whether it is a Hindu, Muslim, Sikh or any other place of pilgrimage or even to holy men or women.

As a people, we are wedded to secularism notwithstanding any faith we may subscribe to personally.

Sikhism is the most modern, the most recent and the most scientific faith amongst the great religions of the world. Its founder, Guru Nanak, had the advantage of having drunk deep at the founts of all the sacred religious lore. A life-long pilgrim, he visited the ancient Hindu temple at Puri in the east, Holy Mecca in the west, the ascetics at Manasarovar deep into the Himalayas in the north and Buddhist shrines in Sri Lanka. Venerated equally by the Hindus and the Muslims in the Punjab, he is still remembered as *Baba Nanak Shah Faqir Hindu da guru Mussalman da pir*. Guru Nanak's times had the harrowing experience of an invasion of the

The author, an eminent writer, was formerly Adviser (Information), Planning Commission.

Punjab by Babar, who indulged in murder and rape and destruction of property most recklessly. The poet in Guru Nanak condemned the barbarities committed by the Mughal forces fearlessly. For a moment, it seems, he revolted even against divine justice. Said he:

Aiti mar pai kurlanen
Tainki dard no aiya?
(Such suffering and such wailing!
Did it not hurt you?)

And yet never, never in his voluminous writings did Guru Nanak utter a word against Islam. He decried the Turks and the Pathans who attacked his country but never the Muslims who were as much his countrymen as Hindus and others On the other hand, while undertaking a pilgrimage to Mecca, he is said to have donned the blue robes of the Muslim pilgrims:

Neel bastar lai kapde pehre
Turk Pathani amal kiya
(He wore the blue robes
The way a Turk or a Pathan does.) *(Asa di var)*

Born a Hindu, communal harmony was a creed with him. All his life he propagated it vigorously.

Guru Gobind Singh, creator of the Khalsa, had the unique distinction of combining in himself the guru and the disciple. He baptised the Sikhs and then sat at their feet to be baptised by them. A democrat to the core of his heart, many a time he declared that he owed all his glory to his people (*Inhi ki kripa se saje ham hain*). At the close of his ministry, he invested his authority of a guru, both temporal and secular, in the Panth, the five elected representatives — *the Panj Piaras.*

The current tension amongst Hindus and Sikhs in Punjab, though unfortunate in the extreme, is no new phenomenon. It raises its head periodically when the mischievous elements have the better of it. A few decades ago, the Sikhs had to shout from the house-tops "We are not Hindus!" (*Ham Hindu nahin hain*). It was to ward off a real or imaginary attack on their identity. At that time so great a poet and patriot as Puran Singh said.

"The great Hindu culture and its innate influence on Sikh culture cannot be denied.

"The Sikh is in no sense an alien; he is born in India; he has the glorious heritage of Indian culture; he cannot be without Prahlad and Mira. Guru Gobind Singh sent his Sikhs to Banaras to study Sanskrit. He is said to have translated *Krishna Lila* himself.

"Our mother-country is India, our language is derived from Sanskrit, but we are modern in outlook, though also ancient as Prahlad and Krishna.

"In view of the political solidarity of India, it is mischievous for any to suggest that we are not Hindus, and not equally Muslims. It is mischievous to multiply the points of difference with the Hindus, which are not fundamental."

What seems to bother the Sikhs currently is again the question of their identity. There are not a few front-rank intellectuals in the community who fear that with the onslaught of modernism the Sikhs may be swept off their feet and lose their identity. Nothing could be farther from the truth. If the gatherings of the devotees at the Sikh Gurdwaras is any indication, faith in the Sikh way of life is growing every day. We have amongst the Sikhs today people who would be willing to make any sacrifice for the preservation of the Sikh tradition. Gurdwara Bangla Saheb in Delhi, which used to be a quiet shrine a few decades ago, is crowded these days with devotees at all hours. And this is true of other Sikh shrines in any part of the country.

The Sikhs have for the first time in history a State in which they are in a majority with Punjabi as its language, something which even the great Maharaja Ranjit Singh could not claim for the community. It is time to make the best of it rather than fritter away the fund of the community's energies in vain pursuits. It is a happy augury that the opinion-makers in the community have helped curb the mounting tension in Punjab starting with the Akalis' clash with the Nirankaris at Amritsar which then spread taking a communal shape on the familiar old pattern.

The Sikhs are a "spirit born people" belonging to a heritage of which any community can be proud. They are hard-working and enterprising. They are friendly and forward-looking, imbued with rare spirit of self-sacrifice. It is their endeavour mainly that has helped the country turn the corner in food production. Guarding a sensitive border, they are the virtual sword-arm of India. Their contribution in the freedom struggle was unique. Their sacrifices in various conflicts with the intruders in independent India, whether they were from the north-east or the north-west, are legendary. They are always in the forefront of every national endeavour. It hardly becomes a people with their great past and no less glorious present to tarnish their image with narrow parochial considerations. ☐

Higher Education : A Critical Look

ASHA RAM

HIGHER education in our country today faces the crisis of declining standards and increasing tensions in campuses. The usual reasons advanced — paucity of funds, proliferation of university education, dereliction of duty by teachers, neglect of studies by students, interference by Opposition parties in the affairs of universities — are only superficial explanations. These do not explain why the colonial features in our system of education persist. These deter the universities from making their own original contribution to knowledge (and helping society). If the universities are to discharge their functions properly, the old habit of copying from Western syllabi, teaching through a foreign language medium with the help of foreign text-books, and increasing bureaucratisation leading to alienation of the university community will have to be ended. Also, the relatively autonomous and democratic functioning of universities which has been undermined since Independence will have to be restored.

'Standards of education' is a relative term. Our national leaders aspired to achieve international standards but this has not happened. Under the system introduced by the British, this was not possible. However, the tragedy is that whatever limited standards had been attained under colonial rule are, with rare exceptions, on the decline.

The question of standards is closely linked to the objectives of university education and the methods employed to achieve those ends. The British who introduced the modern system of education in India had limited aims, namely, maintaining their imperial rule and continuing the process of exploitation. They were not interested in the spread of literacy, much less in the expansion of university education which could produce their grave-diggers. They encouraged the introduction of syllabi which were adaptations of their own: Indian subjects received little attention. A pro-British outlook was sought to be inculcated through different disciplines. Since they were not interested in the socio-economic, political or cultural development of the country, such subjects as science and technology, Indian art, literature and culture were not encouraged. Introduction of English as the medium of education not only discouraged the growth of indigenous literature and culture, but put Indian candidates for various elite services at a serious disadvantage against their European counterparts (who went on to occupy practically all important positions in administration, trade and commerce).

Our national leaders realised the weakness of this system. They asked for the introduction of industrial, technical and scientific education. The need for teaching Indian subjects, and above all, teaching through the mother-tongue so as to develop Indian languages, literature and culture, was stressed. It was the key to better and quicker understanding of subjects. They asked for the expansion of university education not only because it provided an opportunity for better jobs and satisfied the aspirations of the growing new middle class but also because this had become a political question. When our leaders asked for political reforms, they were told that India did not have enough graduates to work them, but when they stressed the need for the expansion of university education to produce graduates they were denied this on the ground that that would lower the standards; an argument which is often repeated even today.

The system introduced by the British led to a number of distortions. For one thing, instead of developing disciplines to suit our requirements and creating our own literature, we cultivated the habit of copying British syllabi and borrowing their literature, mainly text-books. Thus, we were only transmitting the existing fund of knowledge, and not extending its frontiers. With a foreign language as the medium, all that the teacher could do in most cases was to memorise the lecture and deliver it in the class As for the student, all that was required was to cram the lesson and reproduce it at the examination.

To overcome the difficulty caused by the foreign medium and the shortage of text-books, the number of lectures was increased, and occasionally, notes were dictated to serve as a substitute for books. Thus, most of the time which could be utilised profitably in self-study by the teacher and the taught, or in exchange of opinion through seminars and tutorials, was lost in lecture work. The habit of borrowing syllabi persists, and even those universities which have adopted the mother-tongue as the medium follow the text-book method. An unfortunate consequence of this method is that in most of the universities and colleges, the only point of contact between the teacher and the taught is in the class which may have as many as hundred students. The teacher fails to establish close relationship with the student, and thus loses the opportunity to communicate directly so as to influence him morally and intellectualy and to help in the resolution of his difficulties. Lack of personal touch is not conducive to discipline and promotion of understanding. This leads to bureaucratisation of the system.

English medium is responsible for another serious distortion. An impression has been created that all the knowledge of the world can be obtained through this single source. English is an important language and we have built up the tradition of learning it. This advantage should be preserved; however, sole dependence on it is not only inade-

The author was formerly Professor of Political Science in the Allahabad, Sambalpur and Manipur Universities.

quate but even obstructive of independent thinking. No country, howsoever resourceful, can translate all the important world literature into its language. Most often, it translates only that part of it which it needs. Scholars go to originals, they do not depend on translations. In our admiration for English we tend to close all other windows to the external world — something no self-respecting country would do.

The function of higher education is not mere preservation of the existing fund of knowledge and its transmission to the coming generations. The test of a university does not lie in how many graduates it produces, or how many of them succeed in competitive examinations, although this is certainly important. Universities are known by the original works they produce, the new ideas they develop. This implies research, a tradition which we could not possibly develop in the given system of education which inculcated the habit of copying and not of original and critical thinking.

Such has been the ignorance of the research function of higher education that even some of the prominent academics of the old and established universities thought that it was to be carried on only in the specialised institutes, though every university has in its statutes provision for the award of the highest research degrees. Some scholars did go abroad for research and came back with degrees — to cash in on them at the appropriate time and then forget about it. This can be verified from a casual glance at the libraries of even some of the oldest and established universities. Barring a few exceptions, these will be found to be no better than store-houses of text-books and secondary material. The authorities concerned often did not think it necessary even to have qualified librarians.

Many senior teachers did not do any research but tried to acquire this qualification by guiding research. Even the method of research was not always known. Thus, research became a leap in the dark. Scholars landed themselves in difficulties and ended either without achieving anything or by producing cheap compilations of secondary or archival material. Research, being search for truth and service to society, is a moral pursuit which should have an ennobling effect on the scholar and his guide. In our country the result may be the opposite, since degrees are often obtainable through manipulation.

Research did not thrive in the country because it was not functional: it was not organically connected with the process of teaching and promotion of social well-being. Of late, corrective steps to promote research on subjects relevant for the country have been attempted. Institutions have been established which impart training in research methods, offer liberal fellowships and other facilities for research. However, no dent seems to have been made in the method of teaching which remains dependent on text-books.

Wrong system of teaching is reinforced by the traditional system of examination which is based on distrust of the teacher concerned and his virtual isolation from the process of examination of his students. A correct system of examination is not only to assess the merit of the taught; it is also, in a way, a test of the capacity of the teacher to impart knowledge and develop the capacity for independent thinking in his student. Indeed, the teacher concerned can make self-assessment and improve his method. Our system hardly achieves these ends. On the contrary, its unpredictable nature makes it akin to a game of chance.

The system of examination, made up mostly of written examination occasionally supplemented by orals, has also been borrowed from Britain. On the continent, oral examination is predominant. In Britain the teacher in charge is associated with the process of examination at every step. The external examiner is associated only for the sake of objectivity and mutual exchange of experience. However, in India the teacher in charge is generally ignored unless he happens to be a senior one. It is true that a few institutions have adopted the semester system in which the teacher is also the examiner of his students. There are other institutions where up to two-thirds of the total number of examiners in a subject may be internal, but this does not necessarily mean that the teacher in charge will be one of these. The trend is to send more and more question papers and answer books to external examiners and to get back as many in exchange for the senior staff. In a third category of institutions neither the paper-setter nor the moderator is internal.

The traditional system of examination prevalent in India has many flaws. Often neither the paper-setter nor the moderator is an expert in the particular branch and is not always actively associated with the teaching of the concerned branch. Sometimes, the paper-setter does not have the time or the patience to go through the syllabus and includes out of-course questions which escape detection by the supposedly eagle-eyed moderators. Such mistakes cause additional strain to the already nervous examinees who stage walkouts or create disturbance. Generally the problem is solved by putting set questions which are repeated in alternate years with few variations. This system promotes little understanding of the subject and encourages cramming. Examination of scripts by one who does not teach the students concerned is of limited value to him. He is accustomed to set answers and has little time to search for any residual originality which may be there. The speed at which the voluminous and boring job of script-examination is carried out leaves a great deal to be desired. Mistakes occur leading to a demand for review of the result or a re-examination. A system based on distrust of the teacher undermines trust in the system itself.

The practice of set answers to set questions encourages the production of guess papers, cheap bazar notes, and cramming. To overcome the strain of unintelligent cramming the students resort to unfair means which is at times even claimed as a right by certain groups of students. The invigilators tend to overlook the practice in order to escape the wrath of the examinees, or at times even connive at it. Unable to cope with the situation, the authorities are increasingly inviting the police to help.

invigilate. This is the absurd position to which the system has reduced itself in the name of anonymity, impartiality and responsibility.

ATTEMPTS at reform have had only marginal effect. Reform is not popular not because it does not ensure impartiality but because it does not suit the establishment. It implies continuous work, periodical assessment, independence of the teacher in assessment and participation of the student in the process as a check. It undermines the importance of the senior teachers who act as paper-setters, moderstors, script examiners, tabulators, collators and scrutinisers and acquire influence in the process besides making some money. It implies loss of unnecessary and unacademic routine work which keeps them busy the year round.

Shorn of continuous research or genuine research guidance and with a minimum of teaching load, the seniors have ample time for petty politicking and doing petty jobs. It is they who man the various university bodies. Such as the faculty committee, academic council, court, executive council, and standing or ad hoc committees. They are also the external members of similar bodies of other universities. Most often, it is they who go to attend national and international seminars and conferences.

Many of these duties and jobs can be shared so that unnecessary and routine work load can be reduced to enable the seniors to do useful academic work; but this perspective is absent. It will deprive them of power and self which they prize. Lest it reduce their own importance in the department, they seldom like to appoint additional professors. Cases are not unknown of Professors retiring without leaving even Readers in the departments. They prefer to carry on with junior, temporary and ad hoc teachers who are likely to remain subservient. That academic work will suffer and the department will be paralysed does not bother them. Naturally, they promote incompetence and discourage talent. This does not mean that there are no exceptions.

Even during British days, the universities came to have some of the desirable features. They had fairly representative bodies — the courts or the senates to act as their supreme legislatures, enacting laws, receiving reports and passing annual budgets; the elective executive councils/syndicates to act as their cabinet, and broadbased bodies to discharge academic functions. The Vice-Chancellors were elected by the courts/senates which were dominated by the body of teachers, and so they were responsible to the university community. The Government gave them grants and left them free to manage their own affairs within the limits of the relevant Acts.

Since Independence, the universities have lost much of their autonomy: democracy in the campus is in peril. The Vice-Chancellors, whose powers have been increased, are no more the representatives of the university community (though in some cases they may belong to them) and are not responsible to them. The procedure for the appointment of Vice-Chancellors is such as to virtually ensure the selection of the nominee of the Government. Naturally, he looks to it for guidance and not to the university community. Finance officers are deputed by the Governments to look into the utilisation of funds. The Government nominees and officers such as the Directors of Education or even Ministers sit in their executives, senates/courts and selection and finance commitees to promote or protect their own interests. Some Governments have begun to appoint Registrars and even made them transferable. Thus, universities have become a section of the Ministries of Education whose approval is sought almost in all important matters. There are cases where Governments have been found to replace inconvenient Vice-Chancellors by administrators from the Civil Service.

Increased powers of Vice-Chancellors unresponsive to the university community and active participation of Government representatives in university bodies, besides making a mockery of university autonomy, determines their democratic functioning. There are some universities in which the heads, deans and most other members of the executive are appointed on the recommendation of the Vice-Chancellor. This reduce the university bodies to mere advisory status. In any case, such changes in the structure of the universities make them oligarchic.

The reason given for the vital changes is that autonomy and democracy had been misused; but the changes have only worsened the situation. In fact, misuse of power has become more blatant in the matter of appointments, promotions and award of various positions and favours. In the absence of moral support and rule in accordance with law, these are the only methods left to the authorities to administer the universities. They become authoritarian and bureaucratic, which makes it difficult to resolve conflicts in a rational and democratic manner through discussion and persuasion. In the absence of autonomy, the authorities, acting at the bidding of their Governments, tend to adopt an unbending attitude to even the most reasonable demands of the community, leaving the latter with no alternative but conflict, which spoils the academic atmosphere.

For all the evils of the educational system, it is the teacher who is usually held responsible. The public does not distinguish between the authority, the senior teachers who are in control of the system and the Government which acts through the Vice-Chancellors and its representatives on the university bodies, and an average teacher whose voice does not count and who is as much a victim of the system as others. It is not always merit which counts in appointments. Not even the most meritorious can claim appointment as a matter of right. All kinds of principles such as class record, research, experience, good teaching, usefulness for the administration, etc., have been evolved on the basis of any of which appointments can be made. Ultimately, it is the discretion of the authority which matters in appointments, promotions and award of lucrative offices. Therefore the aspirants have to try to remain on the right side of the authorities. This leads to sycophancy and positively discourages good work. There are even places where appointments are secured through bribes. However, the teaching profession is not altogether blameless. The attitude of the teacher to his job has changed. By and large, devotion to work is not what it used to be. There are reasons for it: financial constraint is one and the social climate another.

In the pre-Independence days also teachers were not as well paid as men in other services, yet the payment was adequate to meet their needs. Moreover, what they lost in terms of money was more than made up by the prestige they enjoyed in society as *gurus*. Today their emoluments, except in prestigious institutions, are inadequate. Remuneration is lower in the States and much lower in the private institutions run on commercial lines. The teacher is forced to save his energy from his duties and to resort to odd jobs including tuition, writing cheap notes, examining scripts of different examinations including those of the Secondary Board, and even undertaking business and contract work on the quiet. Earlier, a university teacher was freely available for consultation and considered it below his dignity to accept paid tuition work. Resort to any other business except academic was looked down upon. With the expansion of business and Government activity, the largest number of talented students go to join these services leaving the less talented for the educational field.

Today the only value which seemingly dominates society is money, whatever its source — profiteering, black-marketing, smuggling or bribe. The wealthy enjoy life and exercise influence.

Lack of promotional opportunities makes the situation worse. In Government service a person goes to the top by seniority, but most of the teachers in colleges and universities retire as lecturers or Readers. Degree-level teachers rarely get the opportunity to teach post-graduate courses or guide research. There is little incentive to improvement.

To attract talent to the profession it is necessary to improve the service conditions of the teachers and to the make them free from various institutional pressures. However, basic change in the system of university education alone will enable teachers to discharge their real function — development of the faculty of creative thinking.

BUREAUCRATISATION of the system leads to conflicts in the campuses which are often attributed to interference in their affairs by political parties, mainly the Opposition. The allegation allows the authorities to pass the buck and disown responsibility. This suits the Government in power, for it is not completely free from blame for the acts of omission and commission of the acedemic authorities who have to look to it for guidance. Out of ignorance a section of the academic community and the public agree with this charge, and a feeling is created that the educational institutions should be free not only from political interference but from politics as such. This creates confusion, making the resolution of conflicts even more difficult. We have already seen that educational institutions are not sufficiently autonomous and their authorities are not free from Government and thus political influence. Further, no party is likely to unilaterally give up its right to recruit its cadre from educational institutions and to influence the campuses. The huge sums which political parties, including the one in power, spend on student body elections and the interest which top political leaders take in their affairs is an index of their eagerness to use student power. Parties employ students, teachers and other sections of the academic community not only to acquire a hold on the campuses but to utilise this hold to influence the public and even the political apparatus.

Students in higher educational institutions are adults, more conscious and politically alert than the average citizen. They have not only the right but even the duty to take interest in politics. This is the practice in the advanced countries and this has been the tradition in India. Even during British days, teachers and students took part in politics. In our country teachers and graduates have special representation in the upper houses of the State legislatures, which implies their participation in politics. Teachers have held important political positions in different countries including ours. President Wilson and Henry Kissinger in the USA, Professor Laski in the UK and Professors K.T. Shah and Mukut Behari Lal in India are some instances.

Participation in politics becomes harmful when the teachers, students and other employees begin to neglect their duties. Authoritarianism bureaucratism, nepotism, favouritism and corruption of various kinds, coupled with lack of even the minimum necessary facilities for proper education such as libraries, laboratories, hostels, canteens and class-rooms, and administrative inefficiency, are ammunition enough in any campus for explosions. Any leadership, can exploit it at any time.

However, the conflicts are as yet few and far between because the university community is conscious neither of its rights nor of its duties. It is a victim of the idea of political neutrality and ivory-tower attitude which keeps it isolated from the public. As the community becomes more conscious, more activity should be anticipated. The solution lies not in headlong confrontation leading to strikes and violence but in the democratic method of permitting legitimate expression, discussion, persuasion and acceptance of reasonable claims.

Other solutions such as banning of students' unions and other such activities have been tried but have failed; indeed they had the contrary effect of uniting the student community against authority. The experiment was tried by Chancellor K.M. Munshi, the then Governor of UP, at very heavy cost to himself and to the Government.

When the students find the administration to be corrupt, inefficient and arrogant, completely indifferent to their problems, they naturally agitate. This is to be welcomed; for such agitation is for the improvement of standards, not for their lowering. Nor can the student remain indifferent to social and national problems. The university authorities should leave socio-economic and political

NUCLEAR SCENARIO

The Black Briefcase

A massive movement against nuclear weapons is sweeping the United States now — embracing a wide cross-section of public opinion — a loud and clear echo of the anti-nuclear demonstrations that have rocked Western Europe in recent times. The growing fear that humanity is facing total annihilation is real, and is not without basis. Talk of 'deterrence' — euphemism for escalation of nuclear stockpiling and sophistication by the two superpowers — has ceased to impress anyone. The first-strike syndrome and a slight mistake by the hand on the nuclear trigger — and, "the earth would momentarily flicker back at the distant stars, and then perhaps go out, the very life of the planet extinguished", to quote a grim report in *Time* newsmagazine of America (March 29, 1982).

The report, despite the inevitably distorted view of Soviet intentions vis-a-vis US global purpose, brings out sharply how precariously the world and its peoples are perched at the edge of the nuclear precipice. How much of the responsibility for the current human predicament lies with the USA is clearly brought out. With the present paranoiac President of America on the rampage the danger that faces the human race, as brought out in the *Time* report, is grave.

THE report says that Reagan's retinue constantly includes "a field-grade officer carrying a thick black leather briefcase," "staying near the President everywhere he goes, every moment of the day and night." There are four such officers working in shifts. "They are keepers of the keys to the US arsenal of last resort. Inside the briefcase are 'sealed authenticators', envelopes containing a variety of alphabetical codes called release messages. A series of a dozen or so code words, like TANGO ECHO BRAVO ROMEO NOVEMBER, once transmitted by the President ... to the Pentagon, would constitute an order to fire some combination of the nation's 9,480 strategic warheads, with a cumulative destructive force equivalent to 3,505 megatons (1 megaton = 1 million tons of TNT) at a pre-selected set of targets inside the USSR".

The order for destruction would be relayed, instantly to crews manning ICBMs in underground silos or to the fifteen or so nuclearpowered ballistic missile submarines or to the trategics air command bases, or to all three and other points. The report notes that "Soviet President Leonid Brezhnev does not have a briefcasetoting aide continually at his side. When he leaves the country, war-making authority remains with his comrades in the collective leadership ...:" But, says the report, in the case of the USA it is not as if there are no precautions against possible mistakes. "The procedures for authorising a nuclear attack are designed to involve as many high officials as possible, partly as a safeguard against the danger that any single madman, including a President, could start a war on his own."

The report notes that "compared with the US arsenal, the intercontinental warheads at the Kremlin's disposal are less numerous (8,040) but considerably larger, with more than twice the power of destruction — 7,868 megatons." Understandably, the *Time* report tends to make light of Soviet efforts to get the arms control talks going purposefully, and talks of "highly self-serving, largely spurious proposals for a moratorium on new missiles in Europe."

Fortunately, the report is not all prejudice: "But the blame for the decline in East-West relations does not lie entirely with the Soviets," it says, and adds that "the inconsistency and ineptitude of the Carter Administration made a bad situation worse" and then came "the Reagan Administration....with stubborn, simple-minded prejudices against arms control, unrealistic ambitions for massive rearmament, and a propensity for bellicose rhetoric that has frightened its allies and its own citizens more than it has restrained its adversaries." It refers to numerouss tatements by officials "suggesting a policy shift from the traditional imperative of deterring nuclear war to a new, or at least more explicit, preparedness to wage such a war if necessary." From deterrence to preparedness; and then?

What is happening now is clear in the report. "There is unquestionably a need to improve the nation's defences, but some of the weapons programmes in Reagan's new military budget suggest that the Administration is on a buying binge....This kind of warhead inflation, seemingly far in excess of what the US should need to deter the Soviets, tends to justify the question asked by those who want a weapons freeze: 'How much is enough?' Too often the Administration's answer seems to be simply: 'More, much more, as much as possible'." The difference between the US and Soviet attitudes to the questions of detente and arms reduction and peace — whatever the propaganda aspects—is too obvious to be missed.

"Now the fear of holocaust has taken root in the US, as exemplified in the numerous initiatives of the nuclear-freeze movement. It is as though the spotlight of public attention — and public anxiety —had finally focussed" on the briefcase accompanying the President of the USA all the time. "More intensely and skeptically than before, people are wondering about the briefcase, not so much what it contains as what it represents. Under what circumstances would the President call for it to be unlocked? And what would happen if the codes inside were unsealed and transmitted? And what then? And then?" West Europe, with NATO missiles all over the place, is totally vulnerable in the event of a crazy American President tampering with that briefcase. Is it surprising then that Europeans should have been the first to protest, long before American public opinion realised and became articulate about what Reagan and his fellow-hawks are doing? West Germany's Social Democratic Party leader Erhard Eppler is quoted as saying: "There is the feeling that the US is a greater menace to peace and stability in Europe than the Soviet Union".

After discussing the compulsions — like the proximity of US allies to the Soviet Union and America's own safe distance — that lead to the US Aministration doing everything to seem credible and to convince everyone that its nuclear deterrence is dependable, the *Time* magazine report does not see much ground for confidence that a nuclear war would "follow the scenarios developed by the planners and rehearsed many times by computers....Many fear that the detonation of even one nuclear weapon in a conflict (would lead to) a chain reaction of chaos and cataclysm, warheads flying back and forth with increasing recklessness and ultimately random, total destruction." Nothing can be predicted one way or the other, says the report; and "mirror-image uncertainties apply on the Soviet side."

Of course there are many in the United States, at the top, who would harp on the danger of a Soviet first strike either by design or by miscalculation; there was a reference even to a "nuclear Pearl Harbour". All this is "in keeping with the Reaganauts' generally demonological view of the Soviets". But "Raymond Garthoff, a leading expert on Soviet military strategy, ... believes that the Soviets would consider trying to get the drop on the US with nuclear weapons only if they were convinced that the US was about to reach for its own holster."

That reminds, one of cowboys and of Reagan: what price peace? The *Time* report quotes Harvard University's Michael Mandelbaum, author of a major work on the effect of nuclear weapons on international politics, as saying that "in order to get out of a nuclear war we would have to negotiate. In order to negotiate successfully, the national governments involved would probably have to be intact, and would have to have some means of communicating among themselves and with the other side ... The conclusion to which one comes is that the best way to prevent a holocaust is to prevent any kind of nuclear war in the first place."

Will the groundswell against nuclear warfare have a sobering effect on those closest to the trigger? "The Reaganauts, in their overreaction to the perceived naivete of their Carterite predecessors, have concentrated in their rhetoric and military programmes on war fighting at the expense of deterrence, rearmament at the expense of arms control ... If America's conventional defences were stronger, they would constitute a more credible deterrent ... thereby reducing US reliance on a nuclear last resort.... Some of Reagan's advisers acknowledge, grudgingly, that what they call 'real' arms control is as indispensable to national security as improvements in defence, programmes, since arms control can set rules of the road for both sides and thus lessen the chances of a collision ... The SALT (Strategic Arms Limitation Talks) process contributed modestly, marginally, but still significantly to the avoidance of nuclear war. Reagan has in effect suspended that process."

The report ends on a half-hearted optimistic note, expressing the hope that "the volatile human forces at work on the planet earth may be able to maintain their dynamic equilibrium indefinitely" though this would "require ever-increasing wisdom and skilful management, as well as luck." That however leaves the two most crucial questions facing the world unanswered. First, who will take the initiative for maintaining that equilibrium? Second, who will be able to stop the massive waste of resources on weapons of destruction that either cannot be used at all or can be used only to wipe out all life on this planet, at a stage of world development when vast millions are malnourished, poverty-stricken, dying of starvation while rich nations indulge in the luxury of nuclear weapons proliferation and encourage their satellites — Israel, South Africa, Pakistan for example — to manufacture and/or stockpile nuclear weapons?☐ *Press watcher*

CALL OF HIROSHIMA

The setting could hardly have been more appropriate for the purpose: last week, more than 100,000 Japanese converged on Hiroshima, the first city ever subjected to atomic attack, to demand the abolition of all nuclear arms. Even by relatively conservative police estimates, it was the largest anti-nuclear demonstration ever held in Japan. The country's anti-nuclear movement, it seemed, after years of political infighting which greatly weakened its' effectiveness, was determined to make itself heard.

The "1982 Hiroshima for Peace" rally was the culmination of three months of hectic activity by an ad hoc conference formed by Sohyo, Japan's largest labour organisation, the Chifu-Ren, a league of regional women's associations, and some thirteen other groups. The alliance has been waging anti-nuclear campaigns and collecting signatures for an anti-nuclear appeal to be presented to the United Nations disarmament meetings to be held this summer.

The conference has already collected some 10 million signatures, and other groups are forming to help the cause along. Writers, novelists and journalists have organised one "no-nuke" group, while more than 100 musicians ranging from classical composers to jazzmen formed another. The Hiroshima rally called on the US, the Soviet Union and other nuclear powers to end the "production, possession and introduction" of nuclear weapons throughout the world.

While recent anti-nuclear demonstrations in the West have undoubtedly helped stimulate the re-emergence of Japan's no-nuke sentiments, much of the support is coming from people with a seemingly spontaneous anti-nuclear drive. That, in the only nation that has experienced the horror of nuclear warfare, is hardly surprising.

—*Asiaweek*, April 2, 1982.

This is a moving but remarkably restrained appeal by a son to the friends of his father. Tariq Ali, the well-known Left-wing figure in British Politics, has written this about the plight under Pakistan's martial law regime of Mazhar Ali Khan, the renowned editor of the fearless Lahore Weekly, Viewpoint. This is reproduced here from Sunday (March 28-April 3, 1982) as the readers of Mainstream are sure to respond warmly,in defence of this intrepid fighter. He stands like a beacon in a land which has for too long been plunged into darkness but is sure to reach a new dawn of freedom thanks to men and women of the calibre that Mazhar Ali Khan represents.— *Editor*

The General and the Editor

TARIQ ALI

THIS is not an easy thing to write about for it involves a close relation: my father. Knowing him as I do, I know that he will not be happy that I have chosen to go into print. He is a very modest man, dislikes any fuss being created about him and treasures his privacy: So I know that he will be cross, but my patience has run out. I can no longer remain silent. My father's name is Mazhar Ali Khan and he edits a liberal-democratic weekly in Lahore called, *Viewpoint*. He suffered a mild heart attack in 1978 and has not been well since that time. In addition he has been in prison for two brief spells, which did not improve matters. His doctor suggested that he go abroad for heart surgery and he applied for permission to do so in 1979. The martial law authorities dillied and dallied. He applied again and the response was to ask him to submit himself for inspection before an army medical board. He complied. The army doctors were unanimously of the opinion that he should be allowed to travel abroad for an operation. The longer the delay the greater the chance of deterioration. The regime ignored the advice of its own doctors. Permission was not granted. Repeated requests and letters to civil servants, cabinet ministers and the chief martial law administrator himself were, in the main, unanswered. It is now nearly four years since the day that permission was first requested. As many others have been permitted to travel abroad (including active political opponents of the regime) I am beginning to think that the General has embarked on a personal vendetta against the *Viewpoint* editor.

If this is the case then I wonder at the reasons for such a vendetta. *Viewpoint* is vetted every week by the censor, who deletes all passages which are not acceptable. In any event, Mazhar Ali Khan is not the sort of journalist who lards his prose with vituperative personal abuse. That has never been his style. It could be that he is being punished for my political views, but surely a regime so intensively based on a hierarchy of competing intelligence agencies must know that though we are father and son and feel close to each other our political views are very different. Friends sometimes tell me: "You are naive; for that gang you're all the same. You're Reds." This is probably true of the Jamaat-e-Islami, but I cannot believe that military intelligence operatives are as stupid. For one thing they have been trained by people who have been educated in the United States. Philip Agee's expose of the CIA does not reveal a bunch of fools. Knaves, certainly, but not fools. So General Zia must be aware that our politics are not the same. It is true that my father has been a long-standing member of the World Peace Council, the Pak-Soviet Friendship Association and has visited Moscow many times. If Islamabad is worried that he might visit Moscow they could easily be reassured that he will undertake to have the surgery in New York or London. That is all he is interested in at the moment.

My father is now approaching his 66th year. I have not seen him since 1977, though sometimes we talk briefly on the phone. He has not had an intellectually stimulating relationship with military regimes. I recall vividly one morning many years ago in April 1959. My father was then the editor of the *Pakistan Times*, then owned by Mian Iftikharudin and, as *Time* magazine sourly noted, "the best-edited leftwing daily in Asia." The *Pakistan Times* was part of a chain of newspapers (Progressive Papers Limited) and excercised a progressive and enlightened influence on the country. Ahmed Nadeem Qasmi edited the Urdu daily, *Imroze*, and Sibte Hassan the weekly, *Lail-o-Nahar*. But I mustn't digress too much. In October 1958, General Ayub took over Pakistan. His advisers soon reported that all was well, except for the existence of Progressive Papers Ltd. When every other daily had published editorials welcoming martial law, Mazhar Ali Khan had written the main leader on "soil erosion." There was no way in which the *Pakistan Times* was going to welcome a military regime. Which brings me to that pleasant April morning in 1959. It was about 6.30 am and I was getting ready for school, when a large limousine drove up, flying a flag and bearing a cabinet minister. It was Zulfiqar Ali Bhutto, Ayub's Minister for Commerce. He asked for my father, was shown in and disappeared into his room. I left for school. When I returned, my mother told me that Bhutto had dropped in out of courtesy to tell my father that the military government was taking over Progressive Papers Ltd. The police had surrounded the offices on Nisbet Road and CID men were removing letters and files. They appeared particularly triumphant when they uncovered a letter from Mr Dula Sarabhai as it had an Indian postmark. The next day the *Pakistan Times* carried an editorial written by a bureaucrat, Qudrutullah Shahab, entitled, "The new leaf." The hack proclaimed that the newspapers had become "strangers in the house" and were the recipients of Moscow gold. The same issue of the newspaper carried a brief report announcing that the editor had resigned. Bhutto and other emissaries of the military regime had persuaded my father to stay as chief editor of all the publications. He had not even considered the idea for a minute before rejecting the offer with contempt. The once proud stable of newspapers became the tame voice of any government in power. Mian Iftikharudin died of a broken heart in 1962. Journalism in Pakistan became a hazardous occupation. "At least prostitutes sell only their bodies," people used to say, "but our journalists have sold their souls."

For the next ten years my father lingered in an intellectual limbo. He missed writing his editorials and he never got over the loss of the *Pakistan Times*. Not that he used to say much, but one could tell. For a brief period during 1972-73, he edited the Karachi daily *Dawn*, but Bhutto (now in command of a truncated Pakistan) was never happy with him. Mazhar Ali Khan argued in *Dawn* for a rapproachement between Bhutto's PPP and the National Awami Party (NAP) of Wali Khan and Bizenjo, Neither side liked him for it, but he was aware that if the PPP and the NAP fell out the beneficiaries would be those who disliked all forms of representative government. He accompanied Bhutto to Simla as editor of *Dawn*. It was his first visit to India since Mahatma Gandhi's funeral and he was delighted to meet old friends. Most of his friends had migrated after partition. Bhutto did not like the fact that my father had so many friends in India. He ensured that his days in the *Dawn* were numbered, but as a concession he allowed him to produce a new weekly, *Viewpoint*. During the Bhutto years *Viewpoint* became a critical, but constructive voice and was read avidly in Islamabad. He opposed Bhutto's execution as vigorously as circumstances allowed, though *Viewpoint* was muffled by an increasingly strict censorship.

I don't know about him, but my patience has run out. Since the military regime has so far ignored all requests from within to allow him to travel for medical treatment, I think the time has come to do all that one can from outside. I hope the editor of SUNDAY will not regard it as misuse of this column if I appeal to many of my father's friends in India and others, to mount a campaign in order to pressurise the regime to allow an old man to travel abroad before it is too late.

Survivors of Genocide in Americas

MARIO DE CAUTIN

SOME 600 million people inhabit the American continents. Thirty million of them are native to this land, survivors of what has been characterised as 'the worst genocide in human history'.

There are few detailed statistics concerning the problems of native peoples in the Americas. Some Latin American countries proudly proclaim their racially mixed heritage but for the most part, there is a general reticence when it comes to racial minorities.

To discuss the situation and needs of indigenous people would open the subject of their annihilation and the expropriation of their lands, not to mention contemporary racial discrimination and cultural subjugation.

It would also be difficult to do more than estimate the native population of four and a half centuries ago, when the European conquerors began to arrive.

The Europeans came first to Mexico, Central America and the Caribbean, later to South America and finally to North America.

Archeologists today are astounded by the accomplishments of, for example, the Maya people of Southern Mexico and Northern Central America in the fields of architecture, mathematics, astronomy, irrigation, etc.

In what is now the valley of Mexico, home of one of the largest metropolises of the modern world, the Aztec people lived before Colombus came. They maintained a high order of social organisation and were masters of metal working, jewelry and trade.

The Inca civilisation of what is now the countries of Ecuador, Peru, Bolivia and part of Chile built 5,000 kilometres of highways seven metres wide which were better and longer-lasting than those built in Europe a century later.

During the conquest and colonisation of America, native people were hung as 'heretics', worked in Mexican and South American silver mines until they died, and in North America they were simply massacred in large numbers and steadily backed into the most remote and often least desirable land. But, virulent European diseases, to which the native Americans had no immunity and for which they had no medicine, took the largest toll.

There were at least 13 million native Americans in what is now the United States and Canada when the white man came. Now there are about a million left in the United States and 175,000 in Canada. The Mapuche people of Chile were never fully conquered, although they are now beginning to mix with the European descendants. Of the over one million native people in Chile, there are some 450,000 left. In Brazil, native people today are legally considered as 'minors', and they can take no part in legal or contractual proceedings without being represented by a government-approved counsel. Four centuries ago, there were at least a million native people in Brazil, today there are scarcely 150,000, most of them hidden deep in the Amazon. The United Nations Human Rights Commission in 1979 admonished Brazil for the frequent massacres of indigenous people carried out by plantation owners' private armies and government forces.

In the past the usual reasons for killing the natives were gold, silver and fertile land. Now most of the gold and silver is gone, but on reservations set aside for indigenous people, if the land is fertile it must be fought for. Today, uranium, oil, copper and lumber are frequently the background of clashes between native people and business or state interests. The seventh US cavalry massacred almost a whole tribe of Sioux people at Wounded Knee, South Dakota in 1980. Gold was at stake then. In 1980, the US army returned to Wounded Knee, again to attack the Sioux people, this time over uranium in South Dakota's Black Hills.

The Auca people of the Ecuadorean Amazon area were forced off their land when a Texaco-Gulf consortium discovered oil there. The land of the Campa people in the Peruvian Amazon is now being sold off in lots to European descendants, after the Campas were chased away.

When gold and tin were discovered in the Uraricaa valley, on the border between Venezuela and Brazil, the Yanomami people began to die from bubonic plague and food poisoning; both, say investigators, the result of chemicals sprayed from helicopters by the white men.

Of the 15,000 Nambiquara people living in the Brazilian Mato Grosso forests at the turn of the century, only 200 survive today. Reports in the 1960's indicated that 'someone' had dropped candy bars from planes into Nambiquara lands. Once the native people had decided the candy was safe to eat, the planes began to drop poisoned candy bars to them.

Quiche Maya people went to Mexico last year to testify at the Bertrand Russell Tribunal, where they would only appear with their faces covered. The jails of neighbouring Guatemala, where they live are filled with Quiches, they explained. Sixty per cent of Guatemala's population are indigenous people. According to the Quiches' testimony, the Guatemalan army has begun regularly to raid their communities 'in search of guerrilas'. The real reason, the Quiche people say, is that they live on top of the largest oil deposit in Central America. Since its discovery, the Quiches have been interminably harassed, they testified.

In Bolivia, where 3.3 million Quechua and Aymara people make up 60 per cent of the population, tin is the backbone of the nation's economy, and almost all the miners are indigenous people. The mines are the focus of civilian opposition to the military government and consequently the focus of government repression. The Ayamara and Quechua people live high in the mountains, and the mines are at a high altitude as well. A frequent punishment for native people who have transgressed the white man's law is banishment to the tropical lowlands of Eastern Bolivia. Physically unaccustomed to living in the lowlands, the highland people contract pneumonia and other respiratory ailments, often dying in that unfamiliar land.

But there are still 30 million native people in the western hemisphere, five per cent of the population. In five Latin American countries, they are the majority: Guatemala, Bolivia, Paraguay, Peru, and Ecuador.

In Mexico there are some seven million Nahuatls (descendants of the Aztecs), Mayas, Otomies, Zapotecs, Mixtecs, Tzoltziles and other native peoples. In Venezuela, a million. In Honduras, over 350,000, and an undetermined number in other Central American countries. In Argentina, there are a few indigenous people in the North and East. In Uruguay, the indigenous people were either wiped out or assimilated into the mainstream society.

But this genocide was not carried out without cost to the dominant culture. The revolts led by Lautaro (Mapuche), Caupolican (Araucanian), Tupac Amaru (Inca), Cuahutemoc (Aztec), Hatuey, Sitting Bull, Geronimo and Red Cloud from the United States plains region, Wovoka, Cajeme and countless others are a symbol of native Americans' continuing resistance.

As the Russell Tribunal said in its final statement, 'the Indians of America confront the machinery of economic exploitation and cultural castration with the civilising message of an ancient, unvanquished people'. — *IPS Feature*

Indian Business Community and Capitalism

V.I. PAVLOV

THE Indian business community came to be predominantly composed of the traditional business sections — Marwaris, Chettiars, Gujaratis and others. Colonialism hampered and retarded the development of capitalism in India, but could not stop it entirely. During the First World War, when imports from Europe dried up, the Indian business community got an opportunity to make money. However, after the war they found few avenues for investment. This led to a sharpening of the contradiction between the Indian bourgeoisie and imperialism and to the eventual transformation of the business bourgeoisie into the national bourgeoisie.

The transformation of the business bourgeoisie into the national bourgeoisie during India's freedom struggle gave it a representative character as also an identification with the whole country. Therefore the imperative impulses for the evolution of a capitalist bourgeoisie were removed or at any rate moderated, and the need was not felt to transform the traditional world-view, behavioural norms and moral values. In any case, the creative potentialities of class self-creation are fully developed only when the bourgeoisie participates in administering a sovereign state. This is also necessary for establishing contacts with the external environment.

In Western societies, colonial expansion and protection at home accelerated the development of capitalism and the upper strata of bourgeoisie and brought to them higher culture, social and national horizons, hierarchical claims and prestige. The Indian business bourgeoisie skipped the pre-bourgeois stage, but limitation of sovereignty retarded the process of its growth, especially in universalising itself.

One of the results of the European advent in India was the destruction of the traditional unity of "production - distribution-exchange - consumption". This happened due to the introduction of foreign capital into all four spheres. However, even before the advent of the British, the Indian social system was under heavy strain, for, unlike Europe, India (and most of the East) produced more of the economically parasitic class.

Development of Indian feudalism was interrupted by the colonial conquest at the early stages of its historical formation and the confrontation of the feudal and peasant elements did not take place on a radical basis, with sharp divisions. The caste system too not only did not substitute the estate structure but was historically opposed to it. Without breaking down the caste system and overcoming caste pluralism in the religious consciousness of the Hindus an estate society of mature feudalism could not form, and what is more, the business community could not transform itself into proto-bourgeoisie class. The traditional city as it existed in the West, did not exist in India — that could have provided a favourable medium for the formation of the bourgeoisie. Religious separation undermined national and state unity and impaired the consolidation of business sections. When class delimitation appeared later it could not overcome religious, communal, caste, ethnic and other archaic barriers.

Technology became the object of wide trade relations between town and countryside in Europe, but not in the East. Up to the 18th-19th centuries the wealthy strata of Asian society had no need for orderly and precise measuring of time, a precondition for the capitalist mode of production.

Long existence of business communities in mediaeval feudal societies is itself a phenomenon common to both East and West. Even in Western Europe, when merchant capital claimed relatively greater independence, the merchant, as Engels put it, "did not act as a conscious revolutionary but, on the contrary, as the flesh and blood of this world. A mediaeval merchant was by no means an individualist, he was in essence a community member, like all his contemporaries." Thus European merchant community had to go through the revolutionary stage in the *group aspect* and the stage of associative communalism in the *personal aspect* to come on to the "launching pad" of the bourgeois.

Reflecting on the role of the Reformation in recapturing the mass consciousness of the people of Europe, one can say that Indian reforms merely created philosophical systems without capturing the consciousness of the masses. The only exception was Sikhism. Others created religious and philosophical schools or educational trends of the elite without capturing the consciousness of the masses. But even Sikhism did not have a consistent anti-feudal programme, while the European Reformation was fully anti-feudal, paving the way for bourgeois culture. In fact, what developed in India were conservative trends of religious reformism in the bourgeois nationalist movements. Another reason for retardation in the development of the bourgeois class in India was lack of national consciousness.

An important precondition for social consciousness is the separation from theology of ideological forms such as jurisprudence, philosophy and politics which were joined to it at the early stage of feudalism (as in Europe) or were not separated from it at all (as in Asia). Concepts like "God's judgement" are examples of these prevalent feudal forms. The singling out of jurisprudence from theology as an independent branch of mundane science was of

Prof. Pavlov of Moscow University is a well-known Indologist who has done pioneering work on the genesis of capitalist development in India. This contribution is a summary of the paper he presented at a seminar organised by the Indian Institute of Management, Ahmedabad. (March 4-7, 1982).

great importance also because it influenced both the elite and the common people. Civil legal proceedings caused considerable changes in the system of behavioural norms and evaluations — the emergence of a system which would be parallel to the religious-ethical system. The pre-colonial East experienced nothing of the kind.

With the establishment of the British administration in India, the norms of British law and legal proceedings began gradually to be applied. But up to the end of British rule they failed to become universal or systematic either in practice or, what is most important, in the consciousness of society in which a reformed religious, or even more, a secular world outlook had not become predominant. A sort of dualism formed in the legal being and consciousness of the common man: on the one hand, institutions of family, caste, clan, village or business community sanctified by religion, and on the other, norms of the bourgeois secular law in property, business dealings, etc.

If we include the history of the Indian bourgeoisie in the general historical framework of the ascendancy of the capitalist class, we have to single out three or four independent stages of this process:

First stage: Features of the pre-class existence of the Indian bourgeoisie as a totality of business communities; at this stage there were both general and particular features of its social being. In my opinion, the social status of some groups of European bankers, merchants and even artisans in the 11th-16th centuries was close to the status of the Indian mediaeval business community in such an indicator as ethnic or religious estrangement. The European business community was as opposed to a merger with the social environment as the Indian communities and castes were. However, by the Middle Ages the process of absorption and assimilation of the ethnic business groups of Europe by the surrounding feudal structure had begun. In India no similar process can be observed.

Second stage: The Indian boureoisie's pre-class existence was not marked by the convergence and merger of proto-bourgeois communities, groups and sections into a citizen's proto-bourgeois class-social estate with its special rights, privileges and normatives; the dialectics of this process lay in a simultaneous formation of individualistic consciousness of a bourgeois personality and its awarenese of membership of an estate-class and nation-wide unity, which was coming to replace communal isolation and seclusion. Understandably in Western Europe these processes of consolidation of the proto-bourgeoisie into a class-social estate ran against the adherence of some of its groups to local and corporative privileges. In any case, in the sovereign absolutist states of Europe the first elements of the bourgeoisie, consolidating on the basis of expanding capitalist production, united in national business estates, the initial material for forming the bourgeoisie as a class.

Third and concluding stage: Formation of the bourgeoisie as a class presupposes, in its classical variant, its full and comprehensive experience of the two preceding stages and especially consolidation as a class-social estate of late feudal society. Full or partial skipping of this important process resulted in the bourgeoisie appearing without completing its "gestation period" with some functional capacities, both individual and group, impaired. Such inadequacies marked, for instance, the "late" bourgeoisie of Russia and Japan, which had not accumulated historical experience and culture at the stage of class-estate.

Thus, even in today's India the process of maturing and consolidation of the national bourgeoisie is not complete in several important respects, above all in the socio-psychological and world-view ones. India's historical development provides further confirmation of the fact that capitalist production is the initial premise but not the final condition for business groups being transformed into the dominant class. This process can be complete only when a systematic and comprehensive character is acquired encompassing not only economic, but also institutional, world-view, legal, behavioural and cultural shifts.

Such shifts have taken place in history when the bourgeoisie had to advance from its midst or attract to its side greater thinkers, reformist heretics; artists and writers, military commanders and administrators, martyrs and heroes, in order to accomplish the historical process. ☐

Heikal's View of Arab World

(Continued from page 6)

like the one they did when some people took over the Grand Mosque in Mecca, what would the Americans do? Lend their troops to fight in Mecca? Supposing something similar happened in Riyadh, what could the Americans do then? Go and occupy Saudi Arabia?

But all the oil is in Hasa province, in a small area. The Americans could easily occupy it.

Why should the Americans move in if they are already there — as the employees of Vinnell Corporation which has security contracts with the Saudis, there are already about 12,000 armed in the oil region. They are there, and the oil wells are well protected. I don't think the danger lies in the oil-producing area; it lies in the cities with large populations: Riyadh, Jeddah.

Does the recent signing of bilateral security agreements between Saudi Arabia and its neighbours signify fresh awareness by the rulers of internal threats to their regimes?

Yes. The stress in the Gulf cooperation concept is on domestic matters. One of them is about the movement of nomadic tribes, the problem of passports and identity cards. The other is about contraband, smuggling. But the most important problem is internal security. The only external factor in the cooperation concept is the wish to try to unify arms purchases. In this don't think the Gulf rulers will succeed. There are lots of personal interests and international interests involved. In this sphere there are elements of conflict and coordination.

Is the Fahd peace plan dead and buried, or is it likely to be revived?

I think the Fahd peace plan may be — can be — revived after April. What happens from now until April 26 is important. The shape of things to come after that day is being moulded now. I think Israel will try until the last moment to make it impossible for Egypt to return to the Arab fold, so that Egypt would be left to deal only with Israel on the basis of a long-cherised Israeli proposition.

What is that?

To divide up the spheres of influence: Egypt can do what it likes in the African Middle East while Israel will do what it likes in the Asian Middle East. The most dangerous period is up to April 26, not afterwards. I know that Mubarak is not going to change after April 26 what he signs with Israel before that date. I don't know what's going to happen.

Seven weeks is a long time.

So many things can happen. After all, the decision to annex the Golan Heights was taken by the Israeli Cabinet in one hour.

How do you see the position of Syria today?

Syria is in the most important strategic position in the arc around Israel. There is no doubt about that. Yet one is left wondering about the Syrian policies. For example, I didn't understand why the Syrians did not go to Fez. The Israelis were not going to accept the Fahd plan. It was difficult to see even the Americans accepting it. Yet it was a very important chance for the Arab world to put the Saudis in charge of the plan they had themselves produced.

Some people argue that the Syrians are being made to pay for their refusal to attend the Fez summit.

No. I don't think so. To understand what is happening in Syria today one has to go to the roots, to the nature of some elements in the regime. Nonetheless it is the duty of every Arab to try to protect Syria, because it is in a most important position now. It is really heart-breaking to see that Syria's internal politics are not making it easy for all the Arabs to rally round Syria. The regime in Damascus should try to expand its communications with the rest of the Arab countries and with all the elements in the Arab world.

It seems the Americans want to destroy the Assad regime.

Correct. But if the Syrian regime feels that, it should not (inadvertently) help the American designs. If it thinks (rightly, in my view) that it is the cornerstone of resistance to Israel, then it should not allow itself to be isolated — either internally or on the Arab front.

Before the Fez summit there were reports that Yasser Arafat was carrying messages between Moscow and Riyadh. Do you think diplomatic dialogue is continuing between these capitals, and is it likely to lead to formal relations being established in the near future?

To be frank, I don't accept at face value the Saudi declaration that they don't want relations with an athiest regime — because the Soviet Union was the first country to establish relations with Saudi Arabia in 1926. Saudi Arabia accepted aid from Stalin. The Saudis got money and wheat from the Soviet Union. They sent an official delegation headed by Prince Faisal (later to become king) to Moscow in 1932. But I must confess that I don't understand exactly what is their point of view in this matter.

Could it be that the Saudis raise the possibility of relations with Moscow to put pressure on America and the West?

That won't do. It's time the Saudis realised that they have got power. They need not blackmail the Americans nor be blackmailed by them. If only they would exercise their will and build their bases well inside their country, there would be no need to threaten the Americans with relations with Moscow. In any case, the Americans know very well the limits of the Saudi regime.

The Saudis have more power than they imagine, and yet they are not choosing to exercise it. Maybe they used it once, during the October 1973 war. That was a practical effort along with the rest of Arab world. Maybe, with the Fahd initiative. That was a political attempt too. I think at Fez the Saudis could have induced the Syrians to go. But there was somehow not enough persistence on the part of the Saudis.

Doesn't the prime weakness of the Saudi royal family in its lack of experience in statecraft?

I think first of all you should have a concept. A country is not a concept. A country like Saudi Arabia should have a strategy and a concept, even one based on simple geography. It is a pity to see Saudi Arabia flounder without a concept, waste its natural resources, allow itself for several reasons to be blackmailed, and feel inhibited from exercising its power and fulfilling its role.

We are living in a Saudi era in so far as revolutionary ideas are receding in the Arab World, and in their place is advancing the petro-dollar. Yet Saudi Arabia is unable to play its role in an era which is Saudi by definition.

But petrodollars are no substitute for the kind of history and experience in statecraft that countries like Egypt possess.

Given its financial resources, Saudi Arabia can mobilise practically the whole Arab world. I think many Arabs loyal to the Arab national cause would be ready to give what they have to Saudi Arabia if they know that by so doing they have a chance of protecting and preserving the Arab national dream. We Arabs are going through a difficult period: the Arab nation is now forced to entrench itself inside a foxhole. The Saudis ought to be asked to protect the Arab nation while it is in this state.

Now that President Mubarak has opened certain doors at home and abroad, is there a possibility of rapprochement between Egypt and Libya?

I hope so. Libya is a neighbour. It has a regime which was in line with the Egyptian experience and thought. The inspiration of the Libyan people was Nasser. It was a pity to see misunderstanding arise between Egypt and Libya and lead to that unnecessary clash in July 1977. Unfortunately I have not seen Qaddafi since 1973; I haven't been to Libya since then. I wish and pray that relations between the two countries return to normal.

For Qaddafi, Nasser was the hero.

Obviously. ▫

Sahitya Akademi

(from p. 4)

subsidised rates by the Akademi are sold in its regional offices and in the show-rooms of some publishers who condescend to sell them for the paltry commission that the Akademi is in a position to offer. There can be no two opinions about the high quality of these publications but for them to secure a place in popular places like the railway platform is well-nigh impossible, what with oppressively high rentals and the reluctance of established book-vendors to accord these unprofitable books a place among the fast-moving glossies. However hard the Akademi may try, it cannot act as an independent entity unless the state has a cogent cultural policy. □

Locating Roots of Corruption

(from page 14)

is not recognised that this transformation into contributions for one's welfare is not, beyond a certain point, meant to satisfy one's own creature comforts or for fulfilling one's industrial and/or commercial empire-building aspirations. Not that there are no instances of successful or unsuccessful attempts of the latter type. But basically, a politician remains one throughout and with this money converts himself into a political entrepreneur.

The returns the political entrepreneur obtains have to come, of necessity, from businessmen and private economic entrepreneurs. Even if indirect elections and a political Chief Executive independent for his tenure of the mercies of the electoral college, do not have heavy and pressing need for political uses for money and wealth, will the need of the large industrial, trading agricultural and service sector entrepreneurs and businessmen to twist and turn economic and social regulations cease to exist? If they remain intact, will they not find ways of worming into the system and help initiate processes of perversion of the 'reformed' political system?

To say that "not even the most powerful leader can stop the advance of corruption" after describing in detail the new "demonatic culture" of money power as the basis of all political power appears incongruous. The power of the most powerful is not independent of the system which is presided over. Hence it will not do to point out the inability of the most powerful to stop the advance of the system which has produced this power.

To win elections in an indirect electoral college, money power can be and has been used with far greater effectiveness and more frequently. Not only the stories of tycoons getting into Upper Chambers, but the experience of indirect elections of zila parishad chiefs and panchayat samiti pradhans is well known. Even at such an innocuous level as elections of the Delhi University Students' union, it is well known how the system of indirect elections led to wild abuses of plutocracy.

Corruption is a phenomenon of the political economy. Business seeks returns which are feasible and attractive. So long as ways are not found to curb this fundamental trait, constitutional and narrowly political moves cannot go far. What Bagehot said of the late 19th century British businessmen is no less true of India of today: "The English capital runs as surely and instantly where it is most wanted, and where there is most to be made of it, as water runs to find its level." Either one has to give up the hope of combining social goals with private enterprise, or one has to organise, articulate, mobilise and radicalise the masses in order to intervene for their rights.

An indirect, presidential form of governance cannot give rise to such radical, mass politics. On the contrary, it is more likely to lead to palace politics; it would make politics all the more exclusive and elitist. But radical mass politics will change the form, content and modus operandi of the arena in which the 'large political contributors' — local or alien — operate more directly, and clip their wings. Naturally, the present political structure cannot be left untouched and it has to be modified. But I am afraid not the BKN way — at least not in its essentials.

The roots of corruption are embedded in the political economy of betting on the strong with a view, paradoxically, to benefit the masses and build up an independent, national economy. These roots can also be found in purely electoral politics which demobilises the masses. They can also be seen in a culture which debunks traditionality in the pursuit of imitative modernity and piles up layers upon layers of false consciousness. One ends reading the well-thought out account of B.K. Nehru with a feeling that the battle for a truer consciousness has to be fought on many fronts. □

Higher Education

(*Contd. from 26*)

agitations to be dealt with by the Governments at the political level. They should not become partisan.

But it is difficult to prevent the spread of university education so long as university degrees remain a passport for easy and better paid white-collar jobs, and a status symbol for the class which has grown since Independence and which is politically powerful. Backward regions will also continue to demand more and better facilities nearer home: this demand cannot be considered unjust.

Problems which face the universities are not unknown, particularly to those who are in control of the system at higher levels. Commissions have gone into them and have produced voluminous reports making elaborate recommendations for improvement, but barring some marginal changes nothing tangible has been done to overcome the colonial features of the system, namely, looking to the West for guidance, copying of their syllabi, use of foreign medium, borrowing text-books, communication of only the existing fund of knowledge and not adding to it for the benefit of society, and following a wrong system of examination which reinforces the present system of education. Attempts at overhauling the system face resistance from vested interests. The tensions which the system generates are attributed wrongly to autonomy and democracy in the universities which have been seriously curtailed. But only a radical change in the system can ensure standards and stability in the campuses. □

REPAYMENT OF COMPULSORY DEPOSIT

INCOME-TAX PAYERS

Have you made any deposit under the Compulsory Deposit Scheme (Income-tax Payers) Act, 1974 during the financial years 1975-76, 1976-77, 1977-78, 1978-79 or 1979-80.

IF SO

You are entitled to repayment of the amount deposited with interest in five equal annual instalments, commencing from the expiry of two years from the end of the financial year in which the deposit was made.

THUS

DEPOSIT MADE DURING	REPAYMENT IN FIVE EQUAL INSTALMENTS WITH INTEREST ON
1-4-1975 to 31-3-1976	1-4-1978, 1-4-1979, 1-4-1980, 1-4-1981, 1-4-1982
1-4-1976 to 31-3-1977	1-4-1979, 1-4-1980, 1-4-1981, 1-4-1982, 1-4-1983
1-4-1977 to 31-3-1978	1-4-1980, 1-4-1981, 1-4-1982, 1-4-1983, 1-4-1984
1-4-1978 to 31-3-1979	1-4-1981, 1-4-1982, 1-4-1983, 1-4-1984, 1-4-1985
1-4-1979 to 31-3-1980	1-4-1982, 1-4-1983, 1-4-1984. 1-4-1985, 1-4-1986

HOW TO OBTAIN REPAYMENT?

Apply in Form E to your Bank alongwith your pass book. Form E will be available with your Bank.

HURRY

Claim the repayment already due on 1-4-1978, 1-4-1979, 1-4-1980 & 1-4-1981.

ALSO DO NOT FORGET

To claim repayments in respect of the subsequent instalments falling due for repayment on 1-4-1982, 1-4-1983 and 1-4-1984 etc.

REMEMBER

From 1st April, 1981 the depositors will have the option not to withdraw the instalment amounts and interest thereon on their becoming due. In that event, the amount not withdrawn shall earn interest, so long as it remains in deposit, as if it were a compulsory deposit and the provisions of the Compulsory Deposit Scheme (Income-tax Payers) Act, 1974 will continue to apply in relation to such amount or interest thereon. The depositor is not required to file any option for this purpose.

VOL XX NO 32 SATURDAY APRIL 10, 1982 Re 1

EDITOR'S NOTEBOOK

Gilbert & Sullivan in Town

A Gilbert & Sullivan opera is always an enjoyable treat, but when politics resembles one, it becomes rather disconcerting for the future of the country.

The Maneka affair has become a first-class issue, and there is no sign of Indira Gandhi's aides playing it down: rather every move from the Prime Minister's camp brings grist to her truculent daughter-in-law's mill. Right from the beginning of this unseemly controversy, the Indira camp has been behaving in a manner which hardly enhances her stature: if anything it has helped to provide the widest possible publicity for Sanjay Gandhi's widow.

The entire controversy has shown up that the Prime Minister's establishment prefers to wallow in the trivialities of a family squabble instead of keeping out of it. That the mother-in-law's letter addressed to the daughter-in-law should find its way to the press through the official channel bears testimony to the fact that ridiculous, personal issues are being treated on par with affairs of state. The resort to the so-called "informed sources" to sell a story to rebut Maneka through the UNI has only boomeranged, because it was not difficult for any observer in the Capital to identify these "informed sources", while it has strengthened the suspicion that the Prime Minister's side is not averse to playing this game of mutual mudslinging, projecting domestic bickerings into the political arena. It has become an ugly squabble in which Indira Gandhi's establishment has been shown up as being no better — nor more dignified — than Maneka Gandhi's backers.

This episode has brought out that instead of egg-heads and think-tanks, Indira Gandhi's present establishment is composed of third-class footmen. What has come to replace the Sanjay mafia is a bunch of good-for-nothing busybodies for whom politics is nothing more than an endless series of pettifogging intrigues. Amidst all this sits the Prime Minister's eldest son, fondly meant by his mother to be groomed for leadership, but is found, from week to week, as being eminently eligible to be entitled Unready.

The Prime Minister's Secretariat has long

ceased to be the hub of governmental and political activities. Today, its two major preoccupations are how to deal with Maneka, and, how to enable the Congress-I to fight the coming poll in the four States of Kerala, West Bengal, Haryana and Himachal Pradesh. From the Principal Secretary downward, they all seem to be het up over Maneka Gandhi's movements and the spectre of Opposition ganging up for the election.

A pathetic spectacle of an emasculated establishment.

Can any country be governed in this fashion? Policy issues are shelved except for occasional dusting. Major decisions are deferred, crucial appointments are delayed for months: there has been delay even in naming the nominated members for the Rajya Sabha, as if this is a back-breaking exercise. If the Government has not yet cracked up, it is mainly due to the fact that the civil servants run it on their own momentum.

If the Maneka episode has shown up the shocking weakness of the Indira establishment, the Opposition is in no better state. The devaluation and fragmentation of political parties continue. The latest to crack up is the Lok Dal. Its President, Chaudhry Charan Singh has announced his retirement but this has come only when he has been faced with the virtual revolt of his two State-level satraps, Devilal of Haryana and Biju Patnaik of Orissa. What is intriguing is that the Chaudhry has made it clear that he is retiring only from "active politics" leaving the door open for speculations and alluring offers. One story is that he may have established his hot line with Indira Gandhi to try for the Presidential election later in the summer. After all, it was the Congress-I support in 1979 which had enabled him to become the Prime Minister, however short-lived the tenure might have been.

With elections to four State Assemblies only six weeks hence, neither the Congress-I nor the Opposition presents a picture of bouncing self-confidence. The measure of the Congress-I morale could be gauged from the UP Ministry's scandalous suggestion that the Garhwal Lok Sabha poll — where the Congress-I has to face Bahuguna — be deferred till December, a suggestion which has fortunately been vetoed by the Chief Election Commissioner.

While it is generally taken for granted that CPI-M with its allies would come back with a stable majority in West Bengal, no such hope is discernible in the Left camp about the likely outcome of the Kerala poll. In Haryana and Himachal, the tug-of-war will be between the Congress-I on one side and the projected three-party unity (comprising Janata, Congress-S and the Devi Lal-Biju Patnaik contingent of Lok Dal) which is expected to emerge after their joint rally on April 15. If this three-in-one Opposition conglomerate actually emerges, it will no doubt be a formidable challenge for Indira Gandhi's party. However, there can be no certainty of such an Opposition unity until it actually materialises, because the Indira establishment is known for its infinite capacity at keeping its opponents apart: it has its conduits in practically every party.

It is worth noting that there is no overture from the three-party unity sponsors to BJP which claims to be emerging as the national alternative to the Congress-I. With all the sophistication at his command, Vajpayee could not but feel the isolation of his party from the mainstream of the Opposition. From all this move for Opposition unity, the Communists have kept away. Despite CPM's exchange of polemics with CPI on the question of BJP's role, there is no perceptible move for any open electoral understanding between CPM and BJP.

All this however does not mean that BJP is kept in the cold throughout: the Rajya Sabha polls have shown that the Opposition parties were having quiet adjustments and understanding not only with BJP but at places even with the Congress-I; and this is true as much of the Left as of the Centre and the Right. The logic of election politics is inexorable.

Meanwhile, a comic-opera situation is developing in Punjab. While Indira Gandhi is having rounds of plainspeaking with the Akali leaders, her Home Minister has no compunction in placating the more menacing Akali leader, Sant Jarnail Singh Bhindranwale, whose blessings for the separatist Khalistan move led to a veritable storm in Punjab politics. The Punjab Chief Minister Darbara Singh has not hesitated to condemn Bhindranwale's depredations as "criminal", but Gyani Zail Singh was reported to have touched Bhindranwale's feet during his last visit to the Capital. During his current visit, Bhindranwale's followers are claiming to have established rapport with the Congress-I. Whether this is correct or no, his militant followers have been found to be roaming the streets with unlicensed firearms without being touched by the police which in this Union Territory of Delhi is directly under the charge of the Gyani as the Home Minister of India.

A disconcertingly Gilbertian scenario.

FOCUS

Opposition Unity Moves

ANALYST

THE move for unity of non-Communist Opposition parties minus Charan Singh and the BJP has been initiated, in the immediate context of the forthcoming Assembly elections in Haryana and Himachal Pradesh.

A number of leaders of the Janata Party, Congress-S and Lok Dal dissidents met at breakfast at Janata Party General Secretary Ramkrishna Hegde's residence on April 6, to work out a common strategy. They decided to hold a joint convention in Chandigarh on April 15 and 16.

This move was primarily initiated at the instance of Janata leaders and Lok Dal dissidents. The understanding was that no Opposition unity could be brought about without a split in the Lok Dal. This in essence means that no such unity is possible as long as Charan Singh is is at the head of the Lok Dal; neither Janata nor Congress-S is prepared to accept Charan's control over a united party.

The dimension of the split in the Lok Dal is not clear at the time these lines are being written, for the weight of the dissident Lok Dal leaders like Devi Lal, in Haryana and Kanwar Durga Chand in Himachal has never been tested among the Jats and other backward caste peasantry.

Moreover, nobody believes that Charan Singh would long stick to his declaration of retiring from active politics. It appears that he would allow the pressure to be built on him to lead the Lok Dal, and then rescind his declaration. But, the fact that a Jat leader Devi Lal is openly challenging Charan Singh in the Jat belt assumes significance. This is bound to influence the type of electoral combination Charan Singh has been trying to build for Haryana elections. Charan Singh has been for an understanding with the BJP on one side and Jagjivan Ram on the other.

The BJP has been anxious to have rapprochement with Charan Singh. On the other hand, keeping in view the friction between Charan Singh and Devilal, BJP has also been trying to keep Devi Lal on the right side. Haryana BJP leader Mangal Sen negotiated with Devi Lal while Vajpayee at the central level kept contact with Charan Singh. Immediately after Charan Singh's announcement that he would retire from politics, Delhi BJP leaders Vijay Kumar Malhotra met Charan Singh to persuade him not to retire from politics. A tentative understanding was reported to have been reached between the BJP and Lok Dal leaders that in Haryana the BJP would contest 25 seats. This understanding was reached by keeping both the Janata Party and Congress-S out of the picture.

The split in the Lok Dal and three-party decision to hold a joint covention at Chandigarh would create a new situation, if their present plans go through successfully.

First, Charan Singh-Jagjivan Ram accord will be under added strain. Secondly, the BJP will have to choose between the three-party combination and Charan Singh's Lok Dal and will not be able to quietly negotiate with both Charan Singh and Devi Lal separately. Thirdly, this sudden development, just on the eve of the announcement of the election schedule would create confusion in Opposition ranks.

This development has also to be seen in the light of the fact that the Janata Party and the BJP have been at loggerheads in Karnataka and Gujarat — the two important States of Janata's influence. The BJP had outwitted the Janata in Gujarat Assembly byelections last year. The Rajya Sabha biennial elections have created further estrangement between the two parties. The Janata leaders privately accuse the BJP of having deliberately defeated the Janata candidate Indubhai Patel in Rajya Sabha election from Gujarat, and Janata leaders saw to it that the BJP leader Sunder Singh Bhandari was defeated in the Rajya Sabha biennial election from Rajasthan. It is also a fact that the RSS-wing of the BJP is unhappy with the Janata Party as well as the Congress-S because of the anti-RSS stance of some of their leaders.

In this context, the BJP is likely to go further close to the Lok Dal split; Charan Singh would be more amenable to accept BJP conditions. The Janata Party and dissident Lok Dal leaders are all for merger. This is putting Sharad Pawar in a quandary.

In the April 6 meeting, all leaders agreed to contest the forthcoming Assembly elections on a common symbol. With Charan Singh staying out, the Lok Dal Symbol will now not be available. The Congress-S symbol will be of no use in Haryana and Himachal, for it has no base. Adoption of Janata's election symbol is the only feasible proposition. This would mean merger of identities in practice even if a formal decision is not taken to merge.

The immediate problem facing Pawar, therefore, is what the Congress-S would do in Kerala and West Bengal. Neither Unnikrishnan of Kerala nor Priya Ranjan Das Munshi of West Bengal favour merger with Janata and Lok Dal. (*April 6*).

Reagan and Third World: Blinkered View

M. SHANKAR

Two ideological streams combine to make up the wellspring of the Weltanschauung of Reagan's America—(i) a commitment to 'the mystique of the free market' and (ii) a global anti-Sovietism, derivative of the primitive anti-communism that imbued American politics at the time when Reagan was cutting his political teeth on Hollywood unions. The validity or logical consistency of the two ideological categories is not our concern here. Flawed they may be, but they determine how the present administration shapes its domestic and foreign policies.

Internally, Reagan's avowed commitment to minimising government, the alacrity with which he has dismantled the social welfare apparatus to balance the budget, his tax cuts to stimulate growth — in short, the combination of monetarism and supply-side economics—are based, as Galbraith has pointed out, on a vision of the pristine market unsullied by corporate manipulation. And in foreign affairs, Reagan's panacea of restoring American superiority and dealing with the Soviets from a position of strength presumes that the growth of Soviet power accounts for the relative shrinkage of American power: if America can turn back the tide of Soviet power, unquestioned global primacy would be America's. That the world is no longer bipolar, politically or economically, is forgotten. In American perception, the world exists for the two superpowers. The other countries are merely a theatre for the contest between the two giants and all developments are read in black and white: they are either a gain for America and loss for the Soviet Union or vice versa.

This wellspring of current American ideology — a simple belief in free market and anti-Sovietism — expectedly circumscribes its world outlook. Impinging on this, more specifically in the context of America in international institutions since the mid-sixties, is the growth of what a truculent Moynihan described as the "brute majority". The growing UN membership — concomitant of hastened decolonisation — has made it increasingly difficult for the United States to presume UN support for its policies. Add to this Third-World attempts to use the UN and its agencies as forums to articulate demands for fundamental restructuring of the global system, and the picture of an America chafing under the new conditions is complete. Tension is bound to occur when a global system intended to subserve American interests is sought by the majority to be remoulded and made more responsive to their concerns.

Between the fifties and end-seventies, for example, America has clearly lost out to the world. Fifty per cent of the world's financial reserves, two-thirds of the world industrial output and 50 per cent of world military spending were America's in 1950. Politically, leaving aside a few non-aligned countries such as India, Egypt, Yugoslavia, Indonesia and Burma and of course the Soviet bloc and China the rest of the world was unmistakably with the West. The Nato, Cento, Seato and Anzus pacts embraced Europe, Asia and Australia; the Rio Pact and OAS covered South America. Africa was yet to be decolonised from western control. No wonder that the US could muster an overwhelming majority in the United Nations and could gain international legitimacy for its policies — the uniting-for-peace resolution on Korea, stationing of the Seventh Fleet in the Taiwan Straits, denying China a seat in the UN, landing troops in Lebanon and preventing Soviet intervention in the Congo crisis.

Compare this with the picture in the end-seventies, when the USA accounted for less than seven per cent of the world's monetary reserves, less than one-third of the global industrial output and only 25 per cent of world military spending. The pacts to contain communism in Asia — Seato and Cento — had collapsed and most of the Asian and African countries, choosing not to align themselves with either superpower, had joined the non-aligned movement whose ranks had swelled to over 90. Closer home, Latin America witnessed the birth of radical movements in response to socio-economic conditions as well as the espousal of non-alignment by some countries there.

The shift of the majority in the United Nations, decisively, was in favour of developing nations. The increasing US impatience with this change found expression in Moynihan's petulant accusations of anti-Americanism and in threats of a return to Fortress America. The dominant mood was self-righteous indignation — if the UN could brush aside American sensitivities then America had no use for the UN. For a while, the tone changed somewhat under Carter, and his representative at the UN, Andrew Young, symbolised (while he lasted) America's attempt to come to terms with Third World nationalism. But this experiment proved shortlived and towards the end of his tenure Carter himself increasingly gave short shrift to the liberal stance initially projected by his administration. Under Reagan the pendulum has completed its swing away from the global humanitarianism espoused by Carter, albeit tentatively and for a brief while. "Hard-nosed pragmatism" rates much higher and America's representative today, Jeane Kirk-

patrick, is a professor of politics, a Democrat turned latter-day conservative with an avowed preference for authoritarian (read right-wing, anti-communist) regimes to totalitarian (read left-wing) ones.

CIRCUMSPECTION is a stranger to American policy, more so to the current administration. A deliberate choice has been made to project a more "muscular" international profile; a brazen insensitivity to Third World concerns is its badge of honour, amply displayed in its stand on baby foods. At the 33rd and 34th World Health Assemblies in May 1981, agreement was reached on adopting a code relating to the sale of baby foods. The code was non-binding but merely recommended, inter alia, a ban on advertisements claiming superiority for artificial foods over natural milk and the use of samples and gifts to promote sales. The USA alone opposed the code — because it interfered with the manufacturers' right to free commercial activity! Nothing was to interfere with private enterprise, not even the lives of infants in the Third World who were victims of their mothers' illiteracy. That the American vote was out of tune with public opinion inside America itself is another matter. (The US House of Representatives, on June 16, approved, by 100 to 30 votes, a motion condemning the government position. Two days later the Senate also voted, by 89 to 2 votes to urge Reagan and American infant food manufacturers to adhere to the new code.)

Similar is the Reagan Administration's attitude towards evolving an international regime for the seas. The agreement, which had been almost finalised under the Carter Administration, is once again in suspense. The complex negotiations of the UN Conference on the Law of the Sea, which began in 1967 with more than 150 nations attending, were successfully concluded by the end of 1980. The signing of the convention was scheduled for September 1981, in Caracas. But the new US Administration abruptly announced, in March 1981, that it wanted to thoroughly review the draft convention including the compromises agreed to, in August 1980, by Carter's government. Later the leader of the US delegation to the Conference, James L. Malone, rejected major portions of the draft as being incompatible with US interests. US opposition was particularly to provisions relating to the International Seabed Authority, which were characterised as stumbling blocks to treaty ratification. The fact is that the proposed provisions for decision-making in the Authority and rules on mining metal-bearing seabed nodules beyond national boundaries do not allow scope for America or other western countries to dominate the Authority or influence its decisions. The USA has also passed domestic legislation to the effect that it would set its own terms and conditions to assure the protection of US miners, going against the principle of 'common heritage of mankind', which treats the riches of the oceans as a universal resource, and which has been accepted by the Law of the Sea Conference.

As things stand the Conference will hold a final bargaining round in March-April this year and hopes to have a document ready for signature by September. Whether the US in view of the strategic gains it has made in the conference, such as the right of transit through international straits for submarines and warships, will moderate its stance and forgo marginal profits the mining consortia may make in the absence of a treaty, remains to be seen. Failure of the Conference forebodes anarchy in the oceans with developing countries seeking to restrict the use of ocean space and plunder of the oceans by a few who have the technology and resources to do so, an era of unilateral claims and gunboat diplomacy. Surely the American definition of its interests cannot be so narrow; or is the development of an interventionary capability through the Rapid Deployment Force intended to prepare for such a possibility?

Reagan's approach to what is popularly known as the New International Economic Order, again, is hardly any cause for enthusiasm. American reluctance to entertain Third World demands for a radical restructuring of the global economic system is not new. What is new is the missionary spirit with which the Reagan Administration is preaching its domestic economic policies as the economic salvation of the Third World: keep a tight check on money supply, encourage private investment, thrift and hard work and do not hark about redistributing global income through an increased transfer of resources from the developed world. The Third World must pull itself up by its own bootstraps using Reagan's remedies, which have already sent Britain on a downward slide and which are adversely telling within the USA itself. Reagan's policy thus contrasts with the pleas now being made by influential sections of western opinion for a Marshall Plan for the Third World which would aid not only development of the latter but open for developed economies a way out of recession by generating fresh demand for their products. Initial policy statements by the Reagan Administration indicated a tough stance towards global negotiations, and in May 1981 the US official delegate told a committee meeting of the General Assembly that his country would like to defer consultations till October as it was reviewing the whole question of US economic relations with developing countries. Repeated prodding from western countries such as Canada and France brought about a slight shift in the US position and Reagan, at the Cancun Summit, detailed the conditions under which his government would agree to global negotiations on the issue. But a specific structure for talks could not be agreed upon at Cancun mainly because the US wanted existing western-controlled institutions such as the World Bank and IMF to be responsible for negotiations while the developing countries wanted the UN to be the main forum.

With its penchant for making its entire foreign policy hinge upon its rivalry with the Soviet Union, American attitude on a host of related economic issues affecting the Third World has become far more inflexible. Thus aid through multilateral organisations gets low priority and bilateral aid, which

COMMUNICATION

Doctors in the Dock

MANJULIKA DUBEY has let the AIIMS and its doctors off the hook by plugging for basic health care: "the question raised by the AIIMS affair is not fundamentally whether Doctor X or Y is a good guy or a rotten egg, but how we intend to develop health services in the country" (*Mainstream*, March 27, 1982). This is too charitable. She has probably never been a patient at the AIIMS or been privileged enough to hear about the intrigues that the politician-doctors revel in at that hallowed institution

First, the subject at hand. The Gopinath-Venugopal affair has certainly not ended yet. A huge wall poster in the lobby of the AIIMS declares: "Flashback One: Jan 81 — An extra MCh seat was created for a particular student (he however chose to go to Bombay). July 81 — Two MCh seats were advertised but later cancelled. When approached by RDA the Director expressed his inability to do anything thanks to Professor Gopinath.

"Flashback Two: 6th December 81, ward AB7 — A senior resident was kicked by Dr Venugopal. His stethescope was thrown out of the ward. Next day he had to pick it up from the roof of the hospital kitchen. 24th March 82 — Director asks Residents of Cardio-Thoracic and Vascular Surgery Department to issue a statement and deny the fact they are maltreated. They sign it. Because if they don't they will be further maltreated, threatened, abused and kicked."

Who's telling the truth? No one seems to know. However all are certain that almost everyone is lying — at least partly. Dr Gopinath may be an excellent surgeon but what has happened in the Institute could not be just due to his 'tyrannical insistence on standards'. Most studies in the area of education show that strictness in instructors cannot in isolation cause problems for them. The infamous M.P. from Bihar is alleged to have called Gopinath 'blind' and Venugopal 'an epileptic'. The Institute has bent over backwards to deny these allegations. But the rumours persist and the MP's allegations are believed to contain a grain of truth. If this is so, then AIIMS's official denials are unfair and unprofessional. If Professor Gopinath has had an operation for a detached retina and Venugopal is an epileptic, then the AIIMS should admit it and support the doctors at the same time.

There is nothing wrong in Dr Gopinath operating if his eyesight is alright now. There is nothing wrong in being an epileptic provided proper medication is taken regularly. The AIIMS could have used this opportunity to educate the public and remove the stigma against epileptics. But it chose not to do so. Why? Because the malaise is deep and the AIIMS as sick as the patients that flock to it.

We should realise that the attack on the AIIMS could not be just the result of a single MP's wrath. After all, he must be receiving information from within the AIIMS. So it is a battle between different factions in the Institute being fought in the halls of Parliament. And this is not the first time either. It is also not the only unsavoury happening in the AIIMS in the last few years. The animosities between various groups within the institute are well known. Each group has its own ringleader. Whether a doctor supports a colleague or not depends very largely on which groups the two belong to. Merit is seldom important. After all why are there two facilities for physical therapy at the AIIMS? In spite of the fact that both of them offer similar treatment, some doctors send their patients routinely to one facility and other doctors to the second one. If you thought the choice was made on medical grounds, you would be wrong.

This time the AIIMS community wants its honour upheld. What happened to that honour when the last Director's services were unceremoniously terminated at a Governing Council meeting, even though the item was not on the agenda? A new Director has still not been appointed. Everyone believes that Dr Gopinath was one of those involved in the sordid proceedings. There was not too much of an outcry — not even on the violation of the dignity of the Director's office. It was one clique against another. One does not have to be a supporter of the last Director to admit that the means used to remove him were very unfair.

This brings us to the crux of the matter. All senior doctors in the AIIMS have a few MPs and Ministers in tow. And they use extra-institutional means to achieve their institutional ends. It's an accepted game, professional ethics be damned. So if AIIMS doctors can play medicine with politicians, what is wrong with politicians playing politics with doctors.

This is not all. There is more wrong with elite institutions like the AIIMS than meets the layman's eye. The cockroaches and monkeys, the rudeness and filth, the carelessness and callousness are just some of the more visible annoyances. What about the deaths due to negligence? The stories are legion. What about secondary infections? They are never admitted. What about *iatrogenesis?* No one seems to know the word. So what is this research institution about?

It was supposed to have been a trail-blazer in evolving new and unique methods for teaching medicine in India. What happened? It got a fancy new workshop from Australia and was supposed to be the model for inhouse equipment maintenance and development. The number of instruments out of order is anyone's guess and the number of instruments imported everyone's

Indian Ocean : Who Dominates ?

INDIAN *Ocean is very much in the news. The naval presence of the two superpowers, USA and USSR, has a direct bearing on the security and sovereignty of the littoral states. In a document prepared by the Organisation of the US Joint Chiefs of Staff for the year 1982, captioned "United States Military Posture" a map is attached showing the location of "Facilities Available to US and Soviet Navies —1980". According to this map which is reproduced below, while the Soviet Navy commands 12 points, the US Navy has just double that number, namely 24. Thus while the element of super-power rivalry is not to be ignored, the preponderance of US naval facilities in this region is emphatic, and that is why the Reagan Administration's obstinate refusal to agree to a conference on the Indian Ocean under UN auspices assumes ominous significance.*

This map also shows that notwithstanding official Sri Lanka denials, there is no doubt in the American perception, that Trincomalee offers facilities to the US Navy.

In view of the growing importance of the Indian Ocean region for the security of India and her neighbours, **Mainstream** *is reproducing this map prepared by the highest official agency in the United States.* — Editor

A CIA Forgery

PATRICK JONAS

WERE the American public taken for a ride as far as America's involvement in the Vietnam war was concerned and will El Salvador go the Vietnam way? Well, if a former CIA officer Philip Liechty is to be believed the Johnson Administration faked evidence to prove that the Viet Congs were receiving large-scale arms supplies from Communist countries thus making it necessary for the United States to intervene in Vietnam.

Way back in 1963 according to *Washington Post*, Liechty joined the CIA and was put in charge of searching "personality files" of individuals for other branches of the Government. It was by sheer accident that he chanced upon a misplaced file that contained the documents relating to Vietnam. It included an operating plan for a new agency proposal to fabricate evidence of outside support to the Viet Congs. Since the document was a carbon copy it must have been a reply in response to a directive from White House.

The CIA had in possession a large number of Communist arms. The plan was to load them in a Vietnamese coastal boat, engage it with fire-power and get it sunk and later on show to Western journalists the captured weapons as proof of outside aid. The second plan was to print a large number of North Vietnamese postage stamps depicting the shooting down of a US helicopter by Vietnamese forces, which Liechty alleges were printed in CIA presses. If Liechty's contentions are true then we have to believe that the CIA succeeded in its mission because an enlarged version of such a stamp was published by *Life* Magazine on its cover on February 26, 1965 — a couple of days before the Johnson Administration published its White Paper

DISCUSSION

The perspective of Indian development is fast becoming a matter of crucial concern for the polity of the nation. Taking into account the need for serious discussion on the state of our political economy and the options before the country, *Mainstream* (March 20, 1982) published a contribution from a distinguished observer of the economic scene It has roused considerable interest among opinion-makers. We publish here a response to that article from Dr C.H. Hanumantha Rao, eminent economist, who is at present member of the Economic Administration Reforms Commission. The discussion continues, and readers of *Mainstream* are invited to participate. —*Editor*

Indian Development: Options and Choices

C.H. HANUMANTHA RAO

IN the article "Indian Development: Options and Choices" (*Mainstream*, March 20, 1982), a 'Student of Political Economy' has raised certain important issues concerning the alternative paths of development in India and the role of the Left movement. These issues have been debated ever since Independence and they seem to be eluding clarity even to this day. The Indian situation is so complex and unique that the received doctrines cannot provide ready-made answers and this is at the root of the so-called 'ideological crisis'. The author of this article has made a significant and timely contribution by throwing fresh light on several pertinent issues.

For the sake of convenience, let me summarise the main contents of the above article as I understand them before proceeding to offer my own comments on the formulations contained in the article.

The author argues that there is an inherent tendency for large industrial houses, monopolies and oligopolies to perpetuate and strengthen themselves, within the prevailing socio-economic framework, if there are no restraints on them through public regulation. These monopolies may perpetuate high prices despite the continuous adoption of new technology, with a view to maintaining a high rate of profit. Owing to the limitations of domestic absorption at such high prices, they may increasingly find outlets in the markets abroad with the help of export subsidies. This may inevitably involve them in collaborations with multinational corporations on the one hand, and with surplus producing large farmers in the countryside on the other, with all the adverse economic and political consequences on the domestic front. According to the author, such an 'export-dependent' growth is to be distinguished from 'export-led' growth: the former is the consequence of a particular pattern of growth associated with monopolies whereas the latter would be characteristic of a situation where exports become a leading sector because of the inherent comparative advantage.

The author makes a basic point in this context when he observes that in view of the large size of the country with a large segment of affluent population, general deficiency of domestic demand cannot be a constraint to overall growth in India, although this may be so for particular sectors. The author, therefore, suggests that a reasonably high rate of economic growth is possible through domestic absorption provided costs are reduced with appropriate regulations and development is made broad-based. The author underlines the crucial role of public sector not only as a countervailing power to the private monopolies and multinational corporations but also as a means for widening the industrial and agricultural base and for reducing inequalities.

Such a pattern of development, according to the author, is necessary for furthering the goals of independent foreign policy of peace and non-alignment, economic self-reliance, and reduction of poverty. As against this, 'enclave development' which would inevitably emerge under a neutral economic policy with a weak public sector, would generate socio-political forces which would work against an independent foreign policy, rapid economic development and wider distribution of benefits. Here is an opportunity for the Left to intervene and contribute towards the consolidation of the forces working for national goals of self-reliance, speedy economic growth and social justice. The failure to perceive and seize such an opportunity by the Left and other progressive forces could well lead to a major setback for the national endeavour to achieve the above goals and, therefore, for the future of the Left itself.

It is interesting to reflect on why the line of independent foreign policy, self-reliance through planned economic development and wider distribution of benefits of growth with accent on the removal of poverty, has come to stay. I would like to place these goals as national imperatives for a developing country like ours, which became free from colonialism. The goals of peace and non-alignment, democracy, secularism and socialism emerged out of the very process of our achievement of independence. These goals, which are in the nature of national imperatives, are also indivisible in the sense that one cannot be achieved to the exclusion of the others. A clear perception of imperialist manoeuvres and dangers to national independence is probably the most vital element contributing to the effectiveness with which leadership is provided.

India's survival as a strong nation-state capable of preserving its integrity is the foremost requirement on which depends the prospects of all development — whether of the capitalist or non-capitalist type. Indian history is full of instances when the rulers and society at large got lost in narrow internal grooves and became completely complacent and insensitive to external threats until the doors were knocked. Even those who subscribe to 'internationalism' as one of the principal tenets of their ideology have a tendency to become occasionally insensitive to external dangers and imperialist manoeuvres. In the Marxian analyses pertaining to the developing countries emerging to freedom from colonial rule, the primacy of the role of the nation-state in its survival and development has been highlighted. Lenin was in the forefront in the debate on the role of nation-states, especially in the Asian countries, in preserving their freedom and integrity as a necessary condition for development. It was also recognised in those debates that imperialist manoeuvres would continue in various forms to destabilise these young nation-states so as to keep them economically weaker. It must, therefore, go to the credit of our present national leadership for perceiving clearly the imperialist manoeuvres to keep India weaker and for showing the necessary courage to face the challenge. The resulting foreign policy of non-alignment and active cooperation with the socialist countries, especially with the Soviet Union, were bound to have implications for our efforts at achieving self-reliance through planned economic development and the removal of poverty.

To give primacy to foreign policy and to consider internal policies in an integrated framework, has been part of our tradition handed down from the national movement for independence. This tradition has been very much marked in the case of certain Leftist parties committed to 'internationalism'. However, it is surprising to find the tendency to see the internal policies as being distinct from and unaffected by foreign policy. There can be some inconsistencies here and there for some time between the anti-imperialist postures and internal policies. But for a developing country like India, there cannot by any basic inconsistency between the two in the long run. It is always possible to work on the one for overcoming the incompatibilities, if any, with the other.

As pointed out by the author, deficiency of internal demand is related to the pattern of development itself; a broad-based industrial and agricultural development with adequate emphasis on the generation of employment would have a redistributive bias and would generate the necessary demand for goods and services. Enclave type of development, on the other hand, can yield a certain rate of growth, but would soon face an internal absorption problem and can be sustained only through export promotion. As rightly pointed out by the author, such a situation has to be characterised as export dependency rather than reflecting inherent comparative advantages that underlie spontaneous export-led growth.

Whereas the author believes that even under the existing socio-economic framework, growth need not be constrained by the deficiency of internal demand, he does concede that enclave or elitist type of development can result in deficiency of demand and exports may become increasingly necessary to sustain such a growth. This would mean that improved income distribution is indispensable for durable and viable development. It is, therefore, necessary to emphasise that there would be a complementarity between improved distribution of income and growth in our situation rather than a trade-off as is often believed. The author seems to concede the existence of a trade-off between growth and social justice in our situation, when he says that under the alternative path of the maximum spread of growth involving increasingly larger number of people, "the overall rate of growth of gross national product may not be as high as the model of monopolist-capitalist growth outlined above, but it can still be a reasonably high growth with social justice, with increasing emphasis on providing subsidies and incentives to the weaker sections and generating indigenous capacity for self-reliance."

The proposition that improved distribution may result in slow growth because of a decline in savings rate rests on static considerations. Diffusion of development in so far as it draws in larger sections of society into the growth process may contribute to the deployment of part of the savings for productive purposes which would otherwise be frittered away in consumption. Moreover, absorption of new technology and improvement in labour productivity through improved nutrition, health and diffusion of skills may be facilitated better in a pattern of growth where benefits are widely distributed. A more equal distribution of income and wealth can facilitate the acceptance of alternative institutional arrangements for mobilising larger savings, for increasing labour productivity and for disseminating new techniques.

The experience of agricultural development in India in the recent period fully bears out the proposition put forward by the author that the elitist pattern of development may cause a deficiency in domestic demand necessitating export orientation and that such a development may unleash forces which may articulate demands of the rich to the detriment of the interests of the rural poor and may eventually lead to political formations supporting obscurantist tendencies. The Green Revolution in India has been concentrated in a few prosperous pockets and among large farmers. Although the achievements have been substantial and we have achieved near self-sufficiency in foodgrains, per capita availability of foodgrains has not increased significantly because the gains represent essentially import substitution in respect of wheat. Despite the per capita availability remaining nearly the same, we had piled up foodgrain stocks of about 20 million tonnes for two to three years and it was seriously felt that it would be difficult to sustain agricultural growth without finding export outlets. This is because the growth process failed to generate necessary purchasing power for the rural poor, particularly in the less developed regions. The rural rich emerged as a powerful lobby during this period, pressing for higher prices and subsidies. Politically they have increasingly sought alliance with those forces in urban areas who pose a major threat to the movement for speedy economic development and the removal of poverty. Public investment in agriculture, particularly in irrigation, and for providing essential inputs to small and marginal farmers, especially in the less developed regions, would raise employment, productivity and purchasing power among these large sections of rural population, and would thus serve to counteract the power of the rural rich.

This brings me to the crucial role of the public sector in giving a proper orientation to the pattern of development. The author has rightly emphasised the need for stepping up public investment so as to expand the activities of the public sector. Such a strategy can contribute to stepping up the overall rate of growth because of the essential complementarity between the public and the private sectors at the present stage of development in India. The benefits of growth under such a strategy would be distributed widely by drawing in less advantaged sections into the growth process.

However, it is important to emphasise the need for a major reform of public sector management in India. Without ensuring proper autonomy for public enterprises, and without improving their managerial capabilities through training, proper recruitment methods, etc., the public sector in India cannot play its crucial role as a countervailing power vis-a-vis the monopolies and multinational corporations. In fact, the continued neglect of managerial reform has only contributed to strengthening the bargaining power of the big industrial houses and multinationals. A mere expansion of public sector is not sufficient. It is equally important to make it function more efficiently.

From the operational point of view, the most important point made by the author is the convergence of interests of the Left in India and the forces led by Indira Gandhi for the achievement of the common goals of peace and non-alignment by resisting imperialist manoeuvres, rapid economic development and the removal of poverty, within a secular democratic framework. This, I think, is the crux of the problem. While the national goals, which in my view are in the nature of imperatives, remain the same as were handed down from the national movement for independence, the organisational apparatus working for such goals has been under severe pressure and has weakened gradually in the course of the last 30 years. This was, perhaps, inevitable because a multi-class political apparatus inherited from the pre-Independence period cannot survive the pressures of new challenges which have brought out sharply the clash of interests. Secondly, the corrupting influence of power enjoyed over a long period in a social framework like ours cannot also be ignored. The goals can remain pure and fresh, but the apparatus working for it can get rusted and polluted. A continuous renewal of such forces by drawing in the fresh and progressive elements who have the greatest stake in the fight for such ideals becomes necessary.

There is today a large organisational vacuum between the wide masses of the poor whose expectations have been aroused, and the leadership. Bureaucratic machinery cannot fill in this vacuum which can be filled only by political forces. I think the author has sharply posed here a challenge to the Left: whether they would be willing to muster their resources of patriotism and commitment to the betterment of the poor and come forward boldly to help fill this vacuum. Given the necessary imagination and courage, the Left is poised to play a historic role in the furtherance of the goals of national integrity, planned economic development and socialism. Failure to perceive these opportunities on the part of the Left could well turn out to be a tragedy for the democratic, secular and socialist movement at this point of time in our history. Such a set-back can and must be avoided.

Having fully endorsed the author's plea, I would however like to ask the question as to why the Left has time and again missed such opportunities, especially in the course of the last 30 years. This is an extremely important question from both the intellectual and practical points of view. Unless there is a frank debate on this question, it would be difficult to understand the tragedy of missed opportunities and in the absence of such understanding the appeals to the Left may have only sentimental value without any practical solution emerging.

I am afraid the Left has been groaning under the weight of its received doctrines, which do not permit it to see the realities of the Indian situation with a clear and open mind. The absence of a breakthrough on their part is explained by this doctrinal tradition. In almost all the socialist countries the success of forces of socialism represented the culmination of an anti-imperialist or an anti-fascist struggle, where such forces actually spearheaded the anti-imperialist and anti-fascist movements. In our situation the bourgeoisie held the hegemony of such a movement, although the Leftist parties have had a strong base among the working class and peasantry and some sections of the middle classes in certain parts of the country. The 'economism' of sectional approach has probably been a handicap, as against a national approach that would, as a rule, result when one has the hegemony of the national movement. However, it has been in the tradition of the Left that in ideological debates pride of place is given to foreign policy and the characterisation of the government of the day. This highly desirable approach, nevertheless, does not get translated into a practical line for building up the mass movement for the achievement of the objectives. Attention gets focussed on whether to support or to oppose the existing Government rather than on continuously striving for the goals by mobilising the maximum possible support, including from the ruling groups. In the latter approach, the onus would lie on those ruling groups which are opposed to such goals. The existing approach of the Left, on the other hand, prejudges the attitudes and the role of the ruling groups and thereby runs a great risk of alienating those who can be potentially mobilised for the furtherance of these objectives.

Preoccupation with the characterisation of the existing ruling groups may have been reasonable in certain countries where the correlation of forces was such that capture of power by the Left was in the realm of possibility. However, for the Leftist movement in India, the major task would appear to be gradually and patiently build up the mass movement in furtherance of the objectives of secularism, socialism, democracy and national independence. In this task, certain progressive policies of the Government and the mass support that is already created around such policies can become a great asset for the Leftist forces. What is needed is a modest and positive approach of building up the movement rather than of characterisation of the ruling groups into a certain fixed frame. The existing approach of excessive preoccupation with the characterisation of the Government to decide one's attitude towards Government has several dangers. First and foremost, it runs the great risk of misjudging the ruling class and, therefore, of mis-directing the whole movement based on wrong characterisation. Secondly, even if one comes out with the characterisation that the existing ruling groups need to be supported, the whole policy is focused on supporting the rulers rather than patiently building up the movement around the common goals.

For the reasons mentioned above, I think it would not be an easy task for the Leftist movement in India to play a positive role at this historic juncture without shaking off the weight of received doctrines and looking at the realities of Indian situation with a clean and clear mind. What is needed, above all, is a deep commitment to the solution of the day-to-day problems of the masses of the people and a good deal of modesty in approach. It is surprising that in a country with such problems of mass poverty crying out for solution, the ideological debates for decades together do not bring clarity. In many of the socialist as well as West European countries the Left has learnt to shed much of the doctrinal weight and think creatively by responding more to the felt and crying needs of society rather than getting bogged down in theological debates. The Indian Left has lagged very much behind other socialist movements around the world in moving towards ideological independence.

In the case of the Left in India, one finds a coexistence of sophisticated ideological debates, though unresolved for decades together, with their ready involvement in parliamentary politics as well as in the genuine trade union and peasant movements. It is their dedicated and untiring efforts and the sacrifices made in building up trade union and kisan movements over half a century that have contributed not only to raising the consciousness of the masses of the poor but also to strengthening their organised power. This constitutes a great asset not only to the Left but to the whole national movement for achieving the common objectives. In view of their declared policies, the ruling groups cannot afford to remain indifferent to the vast organisational potential that the Left can offer in large parts of the country for furtherance of the national objectives. Given the necessary imagination and initiatives on the part of both the progressive sections in the ruling groups and the Left, it should be possible to build up a wide consensus in the country for achieving the national goals.☐

Women and Anti-HPT Drive

VIMAL BALASUBRAHMANYAN

IN the current campaign by socially conscious doctors and women's groups against the 'hormonal pregnancy test' (HPT), two women doctors of the Voluntary Health Association of India (VHAI) have said in an article: "Our involvement is because of our concern for women who are passive recipients of many potentially hazardous drugs when low-cost alternatives may exist." The fact that the issue is not just a question of medicine and health but needs to be taken up by feminist activists becomes clear from the attitudes displayed by doctors — ranging from ignorance and indifference to what borders on contempt for the woman who, dismayed or desperate on missing a period, swallows a pill which nobody has told her is no longer a reliable test for pregnancy, can harm the foetus if it exists, and definitely will not cause the abortion she may hope for.

On this issue, as in many others, 'education' of doctors and pressure on drug companies are not enough to stop the misuse; these need to be reinforced by widespread awareness among women and as much adverse publicity as possible for the people who perpetrate the practice or turn a blind eye to it.

Briefly, HPT is an oestrogen-progesterone combination drug and the theory on which it is supposed to work is that if after taking the prescribed dose a woman does not menstruate, the diagnosis is pregnancy. Studies published in the last decade have shown that the test is false-positive in one out of five cases. Research at various centres abroad has shown that birth defects have occurred in babies whose mothers were exposed to these hormones in early pregnancy. HPT has been discontinued in the West and the WHO has said that the test should not be done. And there is a whole string of refeferences from research findings, medical journals and textbooks to convince any doubting medical Thomas to whom the information on HPT's risks has not yet percolated. Drug companies too are aware of the risk and some have recently started printing a brief warning inside the package, in language that may or may not be intelligible to the woman who takes the drug. Doctors campaigning against HPT say that a woman who has been exposed to it should terminate the pregnancy.

First, the attitude of doctors: One reputed woman gynaecologist is emphatic that HPT should not be done and adds that it is no longer done at least in the cities. She thinks the problem is only in the rural areas where there is possibility of many kinds of irregular and unethical practice. She also says, "I think the Government has banned it." Her responses are based on assumptions that are far from the truth. HPT misuse is neither merely rural nor merely urban. No systematic study has been done to assess which sections are most affected. But since it is a drug company product it is reasonable to believe that it has penetrated to every corner where sale is possible, and that includes urban and rural areas. Also, the Government has not banned it. Not yet.

Another doctor, elderly, sincere, with great sympathy for the poorer sections, does not know much about HPT or its misuse, but then he is neither a gynaecologist nor a practitioner. However, he has strong opinions about drug company rackets and often speaks at seminars and conferences against their malpractices. He could raise the HPT issue effectively on important medical platforms — if he knew enough about it and was sufficiently convinced. I show him the VHAI circular and he says: "Yes, this is important. But only a small section of women are affected...3 per cent...the kind of women in urban areas who buy lipstick and perfume..." Now, how does he arrive at a random figure of 3 per cent? Even if it were accurate it represents a sizeable number of women. And why should he assume that only the urban rich are affected?

For argument's sake it can be pointed out that for the urban rich woman, the alternative safe but expensive urine test is within her means and if she does not want a baby she can have MTP (medical termination of pregnancy) done at the poshest of clinics. On the other hand, facilities for the urine test may not exist in rural areas and misuse of HPT may be more likely. The fact however, is that the urban rich, poor and middle class too are exposed to HPT partly because of ignorance (theirs as well as that of doctors) and partly because the status of woman, whether urban rich or rural poor or urban poor or rural rich, has a common denominator when it comes to unplanned or unwanted pregnancy, legitimate or illegitimate.

Another doctor, young and alert, not a practising gynaecologist but who has a DGO, disapproves of HPT because she disapproves in general of 'unnecessary' prescription of hormone drugs. But she has not heard of the risks to the foetus and she thinks there is no danger. She is not aware of the latest findings. However, she is prepared to believe new claims if teachers whom she respects tell her so, — in other words, the VHAI circular citing half a dozen reputed international journals and bodies does not cut much ice with her.

A thriving gynaecologist with a posh nursing home in a well-to-do residential area quibbles when I ask him about HPT. "There are so many preparations, which one are you referring to?" he parries. I show him the VHAI circular and he realises that I am aware of the pertinent facts regarding HPT. Of course, he says, HPT should not be done, GPs prescribe it because they are ignorant, etc, but there is reason to believe that he too prescribes it "when necessary". Naturally, he does not say so directly but it emerges in the course of conversation. For example, I ask, "Don't you think the Government should make drug companies withdraw these preparations so that they cannot be misused?"

"No, that is not advisable because sometime it's necessary to prescribe it."

"When?"

"Sometimes a patient insists on it when she's very anxious to know if it's pregnancy or not, say, five days after a missed period when it's too early for a urine test."

The education of a patient is not the job of this doctor. He protects himself by telling the patient that if she is pregnant she should terminate the

DEFIANT DRUG FIRMS

Here is the gist of a report published in the *New Statesman* last year under the heading, "What mothers mustn't be told". It shows the lengths to which drug companies will go to push their products and how even in the West, medical opinion and recommendation alone are ineffective unless backed by strident public protest.

In early 1981 the Court of Appeal in London banned Thames TV from showing a programme about the drug Primodos on the ground that it was a breach of confidentiality. The *NS* managed to get a copy of the transcript which details how the German drug company Schering justified marketing and then refusing to withdraw a hormone pregnancy test (HPT) drug Primodos even though the drug was widely claimed to cause malformed babies. In the film, a former Schering UK research director reveals that one of the reasons the company did not wish to withdraw the drug despite criticism was that at that time it might have thrown doubt on the company's main product, contraceptive pills, which used the same hormones as Primodos. The producer of the film had earlier worked for Schering on a freelance basis and the film was stopped from being shown when Schering filed a writ claiming breach of confidence.

The programme refers to hundreds of mothers round the world whose babies were born deformed because of the drug. Aggrieved parents in the West who had filed suits for damages were quoted as saying that they "still could not understand how eight years could elapse between the first warning and the eventual withdrawal of the drug".

The *NS* report says that the findings of a 1967 study by Dr Elizabeth Gal were later supported in a report issued in 1975 by the Committee on Safety of Medicines. Further warnings from the same body came in 1977 but the drug was still sold. Primodos was not finally withdrawn until a vigorous campaign led by Jack Ashley brought a great deal of notoriety to the drug. —*V.B.*

pregnancy because HPT will harm the foetus. The way he describes his procedure, it sounds like the take-it-or-leave-it statutory warning on cigarette packets. It is not his job to insist that she wait a few more days and have the urine test, or a little longer and be clinically examined but he is shrewd enough to save his skin by giving her the 'warning' before the drug. Do such patients always terminate the pregnancy? "No, sometimes they change their minds. But they can't blame us if there's anything wrong with the baby."

Perhaps this doctor's style of functioning aims at motivating the patient to come back to him for MTP (such a kind and helpful doctor, he does everything you want). And the luxury look of his nursing home suggests that he may be getting a packet out of his patients whether they decide to ask him for MTP or they continue the pregnacy, to be delivered under his 'expert' care

The same doctor also describes cases where his patients were delivered of such abnormal babies that on questioning, the mothers eventually admitted having taken all kinds of pills (hormonal as well as toxic homoeopathic compounds) in their desperation to get rid of the foetus. This perhaps explains his notion that whenever a woman is keen on HPT it means she doesn't want pregnancy. He ignores the fact that she may want HPT because she does not really understand the risks, or she believes it to be a safe abortifacient. He also ignores the fact that often an unplanned pregnancy which causes initial dismay is not necessarily an unwanted pregnancy after it is confirmed. The unnecessary risk to babies of mothers who change their minds about termination is not his concern in the sense that he does not feel responsible for the 'irrationality' of the women concerned. His attitude is eloquent in the way he refers to "these women".

And here lies the crux of the matter: why should a woman remain so uninformed and why should she be reduced to desperate and dangerous efforts at abortion when legal MTP can take care of contraceptive failure and when there is every reason why she should bypass HPT? The secrecy needed from friends and family, the trauma of getting it done at a hospital or clinic, maybe facing the unsympathetic and self-righteous attitude of doctors and para-medical staff towards "these women" — all this can be too much. An overdose of the hormonal drug could result in the bleeding of threatened abortion and her life would be in danger. And if for any reason she cannot get the abortion done (opposition from family or husband) she has unnecessarily exposed the baby to risk. The attitude of society as well as of doctors is responsible for ill-informed women opting for a dangerous way out.

Now the drug companies. It is only in recent issues of CIMS and MIMS (the popular prescribers' guides) that some companies have included pregnancy in the contra-indications for these products. Some firms cleverly write "see literature" in this column. Since prescribing habits die hard, how many doctors have noticed the addition of contra-indications in the latest issues of the guides? How many bother to 'see' the literature and act?

Dr. A.R. Phadke, in an article on HPT misuse, quotes the detailed information running to a few hundred words that has to be statutorily provided with the products sold in the US according to FDA regulations. The brief warning in the brands sold by the same companies in India is so bland that the risk is underplayed. Also, the warning is printed inside the package so that a woman will see it after she has bought it and opened it. One brand has the warning printed in microscopic letters not even inside the package but on the aluminium foil and bright light and perfect eyesight are needed to decipher it. None of the brands has a clear bold warning on the outer label: "Don't use for pregnancy testing. May cause abnormalities."

What about the pharmacies? The owner of a nearby drug shop says he sells about a hundred packets every month of the two brands he stocks. (There are about 16 brands in the market.) About half are sold on doctors' prescription. Many who buy it are young girls. (Of course some of these prescriptions may be for genuine secondary amenorrhoea where pregnancy has been positively ruled out.) Sometimes the girls or their guardians ask for 'medicine to start menstruation' and he 'prescribes' these hormonal pills. How many buy the drug to test for pregnancy is not known. I point to the 'Schedule L Drug' marking on the label and ask how he can sell without prescription. *Kanoon* is one thing and *jo chalta hai* is another. But he thinks he is really helping these girls and women —when "all fails" he tells them, "Go to the nursing home". He knows nothing about the foetal risk. The information in the VHAI circular doesn't really sink in—so many drugs are dangerous, this is just one more. *Besides, doctors also prescribe it.* The only thing is he may be sincere in wanting to help, and if it were possible to enlist the cooperation of pharmacists it may be an important way of reaching the women who buy the drug. On the other hand, to counter a drive to educate the pharmacists, drug companies are capable of giving them inducements to sell the drug. While a multi-pronged effort to create awareness among all sections is needed, ultimately it is the woman who can protect her by knowing more about the pills she swallows and how these affect her body and her baby.

VHAI doctors point to the need for developing alternative, cheap, safe diagnostic tests for early pregnancy. Dr Phadke writes that pathologists charge between Rs 35 and Rs 80 for the urine test — while HPT costs less than Rs 10. It is argued that when so much money goes into contraceptive research surely some funds can be set aside for developing early pregnancy tests. Another alternative is a simple procedure called menstrual regulation which can be done in an outpatient clinic within 10 days of a missed period if pregnancy is unwanted. How many women know of this alternative and that it is safe and cheap? Is it easily available? Are women deterred because of the 'stigma'? Are they being turned away when they seek it in crowded hospitals?

The irony of the HPT issue is that so much propaganda goes into 'motivating' women to accept the pill, the loop, tubectomy, etc, but there is hardly any initiative from the same family planning bodies, official and non-official, to disseminate information on related matters which are of just as much relevance to the women concerned. Instead of the ghastly Nirodh commercials on Doordarshan or those terrible short films on population explosion why not a film in public interest on the risks of HPT? ☐

Bureaucracy, Development and People

T.K. MOULIK

OVER the years there has been a phenomenal growth in government bureaucracy in India both in its size and in its functional responsibilities. The following account of the district administrative machinery of Rajkot district is revealing:

> In Rajkot district, in 1973-74, this segment (government administrative machinery) consisted of 7,386 functionaries. On an average, there were nearly 103 paid functionaries for a group of 12 villages, or one functionary for every 21 rural households or every 40 male persons above 14 years of age.... In 1973-74, this segment of district administration spent about Rs 80 million, out of which 49 per cent was on famine relief works. Of the remaining amount of Rs 41.2 million, about 56.7 per cent, was spent on welfare services like education, medical facilities, health, family planning, community development, cooperative and social welfare. Only 17.6 per cent was spent on production-oriented activities like agriculture, irrigation, animal husbandry, industry, and forests, and 17.6 per cent was spent for infrastructure development such as construction of roads and buildings. Out of Rs 80 million, about 32.3 per cent was spent on salary and allowances. If the expenditure on famine relief works was not considered, the expenditure on salary, allowance, and contingencies formed about 62 per cent. (V.R. Gaikwad, and D.S. Parmar, *Rural Development Administration Under Democratic Decentralisation, 1979*.

The all-embracing presence of government bureaucracy in India becomes still more revealing if one examines its wide-ranging functional responsibilities. Today, there is hardly any activity of a private citizen which does not come into the purview of some part of bureaucracy or the other. There is certainly no welfare and development activity which is not controlled and regulated by the bureaucracy. It is therefore legitimate to postulate that, given the pervasiveness of government bureaucracy, one cannot but expect it to play the most pivotal role in India's development efforts. The question to be asked is whether the bureaucracy as it obtains today is capable of playing and willing to play the expected role, and if so, for what kind of development and for whom.

This question becomes crucial once we attempt to define the nature and task of development. At the outset let us not make the mistake in equating growth with development. Given the country's widely uneven and skewed socio-economic structure and its historical context, simple economic growth cannot be taken as a measure of development. Neither can we accept the theory of 'percolation' of growth-benefits. For, in actual practice the benefits do not percolate.

What then is meant by development? Development is the process by which the people's standard of living is raised, with equitable distribution and control of wealth and means of production by all sections of the people. In other words, what is aimed at is the establishment of production relations in such a way that not only is productivity increased and more wealth created but equitable distribution of wealth without minority-control over the means of production is also ensured. If we accept this proposition, it is clear that such a process of development is possible in India only if the people become conscious and confident in actively participating in development efforts, exerting all their energies and exercising their rights as a vital part of society. This means people's development in order to harness people's power. Again, under the prevailing objective conditions, since the vast majority of India's population are discriminatingly and exploitatively kept out of consciousness and confidence in exercising their social and economic rights, the immediate task of development should inevitably be directed towards this large majority of lower-rung people living in abysmal poverty and exploitative conditions. In terms of action, development in India means the development of this large majority of poor people, consisting of landless labourers, small and marginal farmers, workers (especially workers in unorganised sectors), who constitute more than 80 per cent of the total.

In essence, people's development in India has to have a deliberate bias towards the poor majority. This is a very important and crucial point, often deliberately overlooked. Let us not waste our energy in trying to wish away the stark social fact of class contradictions in India. At one extreme, there is the minuscule minority consisting of the comprador bourgeoisie and capitalists, feudal and semi-feudal big landlords, and on the other the huge majority of ruthlessly oppressed and exploited poor, hungry, naked, houseless and unemployed peasants, workers and petty-bourgeoisie. In our semi-feudal rural economy, about 80 per cent of the land is concentrated in the hands of the 20 per cent landlords and rich peasants, while 80 per cent of the rural population has no land or very little land. Added to this extremely skewed land ownership pattern are extortionate usurious credit, forcible eviction of tenants, exorbitant rent charged from tenants and share-croppers, continuing serfdom and bonded labour system, unabated miseries and oppression of Scheduled Castes and Tribes.

The role and capability of the bureaucracy in the process of people's development should naturally be examined in relation to this vast majority. For, the minority class owning and controlling all the means of production and socio-political power does not necessarily deserve any development assistance from the bureaucracy. It is irrefutable that an officially-sponsored development programme to be implemented by state machinery can have relevance only if it serves the interests of the large majority of the downtrodden and the exploited.

If we accept this premise, which is often conve-

The author is Professor in the Indian Institute of Management, Ahmedabad.

niently neglected in our debates, then we can easily identify the constraints and limitations of the bureaucracy. (see, for example, D.C. Korten, and F.B. Alfonso, (eds) *Bureaucracy and the poor: Closing the Gap*, 1981). Basically these constraints arise out of two historical factors: the class composition of the bureaucracy and the nature of bureaucratic functions.

Let us take the relatively higher echelons of the bureaucracy which determine the policy, implementation and general direction of development programmes. There are three distinct types of people manning this section:

(i) The most important — and large majority — is the group of nationally selected administrative service cadres (IAS, IPS, IFS, IEC, etc.) including state services cadres. These are the brahmins of the Government bureaucracy, an exclusive club, having largely generalist educational background without any specialisation (mostly graduates and post-graduates in arts and science). Apart from the basic formal educational background, their only other qualification is that they are selected in so-called national or State-level competitive examinations. In fact, it is the competitive examination alone which bestows them with brahminical exclusivity in government bureaucracy.

(ii) A very small minority group of scientists or technocrats or management experts catapulted into the bureaucracy at various levels. The process by which this category of people, often eminent in their professions, get into bureaucratic positions is characterised by various factors ranging from nature of job, political linkages and manoeuvring, to personal ambition. Be that as it may, this is still a minuscule group in the Indian bureaucracy, though ambitious enough to claim a share of the cake of bureaucratic power and political recognition.

(iii) Below these two groups is a huge/army of lower level bureaucrats. This is a mixed group of technocrats, generalists, scientists and subject-matter specialists (for example, extension workers, foresters. etc), who are basically deployed to implement and supervise the programmes initiated and imposed by the higher echelons, namely, the two groups mentioned above. In professional knowledge and field-level experience, this group of bureaucrats is probably far better equipped than the other two but has no decision-making power or scope to influence policies and programme content. Numerous though they are, there is a process of selection through stiff competition, and for most of them life's ambition is to rise in rank in the hierarchy.

Having characterised the hierarchy of bureaucracy, it is easy to examine their class background. It should be clear to even a casual student of Indian history that there could be hardly anybody in this bureaucratic system with a truly proletarian background, not at least in the first two critical categories. By the sheer weight of the historical process and given the prevalent skewed socio-economic structure, educational system and general political conditions, the working class is bound to remain excluded in the competitive process of selection. The classes which normally come into this bureaucratic stream are largely feudal or semi-feudal landlords, land-rich farming gentry, comprador elite bourgeoisie and capitalists. In other words, they are mostly people from the rich and middle class categories, and that too largely with an urban background. It is only among the third category mentioned above that one may find some from the petty-bourgeoisie class. It is often argued that the Indian bureaucracy is being increasingly representative of the poor downtrodden class by citing examples of the entry of some Scheduled Castes and Scheduled Tribes people under reservation rules. Not only they are negligible in number, but in most cases their class background is not truly representative of the large masses of the Scheduled Castes and Tribes. They are really brahmins among their caste and tribal groups in socio-economic terms.

Given the class background of the bureaucracy, it looks as if the normal bureaucratic roles, functions and responsibilities are tailor-made for them. To ask whether the class background of the bureaucracy determines the nature of its functions and roles or *vice versa* is only to look at to the sides of the same coin. In other words, both the hypotheses seem to be valid, irrespective of some of the radical politico-economic programmes and slogans enunciated by the Government more as a matter of political expediency than of ideological commitment. What then are normal bureaucratic functions and roles?

Since the modern Indian bureaucracy has its historical roots in British colonial rule of 200 years, its character in the post-Independence period is still largely determined by the colonial legacy. Thus, in the pre-Independence period the major thrust of bureaucratic functions and responsibilities was mainly concerned with law and order and revenue collection, while in the post-Independence era one more additional function is emphasised — that is, the regulatory and monitoring function in relation to various projects and programmes (governmental and non-governmental). In either case, bureaucratic roles and responsibilities are bound by a set of rules and regulations geared around definite time-bound targets and budgetary expenditure. Armed with financial and regulatory power, the bureaucracy, with its class background, easily assumes the role of 'giver' as against the vast mass of poor 'receivers'. This point needs to be explained.

Be it developmental or non-developmental, a bureaucracy is generally identified with an administrative hierarchy built around specific programmes/projects of activities. The objectives of these programmes/projects are normally broken down into some specific time-bound targets with budgetary outlays. Thus the state bureaucracy is essentially an administrative machinery to operate a delivery system through which time-bound targets are aimed to be achieved and the budgeted amount spent. So far so good. But in the process two distinct trends develop in the bureaucracy: first, undue concern about and over-emphasis of the delivery system at the cost or even to the detriment of the people's participation and interest that is, the receiver-system. Second, the bigger the target and budgetary allocation for a programme, the more conspicuously prestigious and powerful the concerned bureaucracy is perceived to be. The latter trend seems inevitable given the mobility and temporary nature of the bureaucrats in one particular position, and the emphasis on target achievement and expenditure of budgeted amount in evaluating the performance of the bureaucracy.

Thus the bureaucracy manned by a select group and class of people through competitive methods is again thrown into severe cut-throat competition in the operational field. Human nature being what it is, the response of the bureaucrats follows a predictable pattern. First, almost all of its energy and efforts are concentrated in regulating, monitoring and expanding the delivery system in order to achieve the most visible targets as quickly and as easily as possible. To the bureaucrats this means three types of action: (1) To follow mechanically the rules and regulations and precedents irrespective of what the situation requires. For, any change in the system involves a painful process of thinking, analytical study and prolonged persuasion at the risk of causing delay in target-achievement or even failure; (2) to work through the existing power structure and contacts—the path of least resistance. For, otherwise it would require a lot more effort and time to establish alternative structural contacts which may often lead to conflicts and confrontation with the existing power structure; (3) to concentrate on establishing linkages and contacts with the higher echelons of the bureaucracy and the political system in order to ensure personal rise in the hierarchy.

The second kind of response is a continuous effort to expand the empire in terms of subordinate manpower, control over increasing infrastructural facilities like cars, vehicles, office premises, etc., and lobbying for more and more financial allocations. For, only through such expansion of his empire can a bureaucrat gain in prestige and power. Thus, there is hardly any bureaucrat who does not crib about shortage of manpower and infrastructural facilities for the implementation of a programme/project. In fact, one of the constant items in project planning is the demand for additional subordinate manpower and other infrastructural facilities. It is interesting to observe that the pervasive zeal of bureaucrats in building their empires is such that even their offices assume an almost monotonous look in terms of furniture, interior decoration, exclusiveness, distance from subordinates and the general public.

The 'giver-syndrome' of the bureaucrats vis a-vis the huge mass of 'receivers' — that is, the people, particularly the poor—can be understood in view of the two types of response mentioned above. None of these responses can bring the bureaucratic nearer to the people. In fact, there seems to be a deliberate design to maintain a distance so that the bureaucrat can play the role of paternalistic feudal lord or a tyrannical 'giver' with unquestioned authority to act according to his own convenience. Since the receivers are largely illiterate, ignorant of their rights and unorganised, there is hardly any pressure to bring the bureaucracy to the level at which there can be meaningful, active participation by the people in the process of development. Neither is it in the interest of the bureaucrats that such pressure from the receiver-system should develop which will clip their own wings. To organise, to educate and to actively involve people means to share power and authority, and reduce the dependence of the receivers, that is, to be at the level of the people and be one among them. This is too high a price to pay for a bureaucrat who thinks he has earned his position of authority and power as a 'giver' through hard labour against severe competition. On the other hand, being addicted to power as 'giver', bureaucrats seem to privately enjoy and often publicly demand deference from subordinates and the public. A state machinery fuelled by public money and supposedly having public responsibility becomes almost the private fief of the bureaucrat. It is therefore not surprising to find a senior bureaucrat handling Rs 200 crores annually grumbling that he is entitled to a mere Ambassador car while a private owner or manager of a private enterprise handling the same amount of money or even less has a Mercedes car. It is striking that the bureaucrat conveniently forgets that not a single paise of the Rs 200 crores is from his pocket, that he is a mere public servant hired by the public to use public money as the public desires.

Another manifestation of the same empire-building phenomenon can be observed in the creation of the semi-government or semi-autonomous corporations. The only differences between a direct state bureaucracy or department and a semi-autonomous corporation are the perks and facilities enjoyed by the bureaucrats in the corporation and the flexibility in terms of rules and regulations followed in the normal government bureaucracy. In other words, a corporation is one step ahead towards the coveted image of a bureaucrat's private empire. In recent years there has been a mushroom growth of such corporations in India headed and manned by bureaucrats. This phenomenon is partly based on the oft-repeated argument that the bureaucrats perform most efficiently in crisis-management. It is implied that in the absence of restrictions of normal rules and regulations and provided there is freedom of action a bureaucrat performs better. Thus it is made to appear that the bureaucrat can be efficient only when there is a full play of his 'giver' role without much of restrictions and restraints. Crisis management like flood and famine relief provides the bureaucrat such unfettered and unbridled opportunities. The idea of semi-government, semi-autonomous corporations seems to work on the same logic. It was not surprising when the topmost bureaucrat of a State, the Chief Secretary, said he would prefer to be Managing Director of a prestigious Corporation rather than head the State bureaucracy because of the extra perks, facilities, foreign trips, power and authority — that is, the 'giver' par excellence.

It is in this context that the bogey raised about a 'committed' bureaucracy needs to be understood. When the bureaucracy is asked to be committed, it means commitment to the existing power structure, oiling the existing delivery system, not commitment to the people, to serve and to strengthen the receiver system. The basic purpose of raising this bogey is to reduce deviance and dissonance between the bureaucracy and the existing socio-economic structure — a structure on the maintenance of which the existence of the present political power arrangement depends. Fear of deviance and dissonance arises out of various legal and developmental programmes which, if properly implemented, may endanger the existing social order. By asking for 'commitment', the bureaucracy is given the signal that implementation of various developmental and legal programmes should be limited to the extent that it should not upset the apple-cart of the existing social order. The kind of commitment sought from the bureaucracy comes easily to most of the bureaucrats — after all they are only asked to sail with the wind.

This question of committed bureaucracy and the subtle campaign for commitment among bureaucrats by the political power structure, demonstrate the existence of or potentialities for deviance and dissonance among a section of the bureaucrats Such a threat exists for two reasons, often inter-dependent and inter-related. First, irrespective of class background, many young bureaucrats carry with them at the entry point various shades of ideological values and attitudes acquired consciously or unconsciously in their young days, mostly in colleges and universities. In many cases the pre-entry ideological consciousness and values are totally different from or even diametrically opposite to the ideological base (if any) of the ruling elite. Most of these young, newly-recruited bureaucrats who run headlong into ideological conflict with the ruling elite are the middle class bourgeoisie. Though their ideological consciousness is most often not steeled by social practice, their middle-class bourgeoisie background and linkages with the left out peer group keep their ideological consciousness alive for some time. Initially, these young bureaucrats attempt to implement various developmental policies and programmes with their pre-entry level of ideological values, thereby creating a dissonance in the system and socio-economic power structure.

The second reason lies in the very nature of some of the developmental policies and programmes which for some political reasons or other are promoted or perhaps are forced to be promoted, but are essentially aimed at changing the existing socio-economic order. Programmes and policies like land reform, cooperative credit and marketing facilities, various loans and subsidy schemes, SFDA/MFL schemes, Antyodaya schemes, removal of rural indebtedness and bonded labour, minimum wages law, MRTP Act, nationalisation of banks and similar other programmes (including "Garibi Hatao" and the Twenty-point programme) come to mind. Ostensibly, these programmes are promoted to benefit the downtrodden proletariat. Many of them are quite radical or revolutionary in the sense that, if truly and properly implemented, they can alter the socio-economic power structure considerably. Young bureaucrats with different (from the ruling elite) ideological constructs may use these programmes and policies in their delivery system true to their overt intent and purpose, defeating the covert purpose of the ruling elite. Hence the concern of the ruling elite for a 'committed' bureaucracy. Many of these policies and programmes are promoted by the ruling elites merely for consolidating the vote-bank. It is in fact naive to think that the ruling elite would like to demolish the very socio-economic structure that keeps them in power.

Few in number as they are, these recalcitrant bureaucrats do indeed pose a threat to the existing power structure. As a result, they attract all kinds of pressure and arm-twisting from the socio-political and administrative hierarchy in order to pull them into line. The pressure takes a carrot-and-stick, form – incentive promotion, coveted posting, foreign trips. study leave, etc., on the one hand, and the threat of punishment in the form of transfer, delay in promotion, posting to infrastructurally difficult areas or to not so-important decorative positions, official and non-official harassment, etc. Given the not-so-firm ideological commitment and the middle-class bourgeoisie or petty bourgeoisie background, most of these bureaucrats soon succumb to the pressure Many senior bureaucrats readily admit that within a short period (2 to 4 years) after entry, all their enthusiasm, motivation and ideological values in relation to bringing about basic socio-economic changes become steam-rollered into a stereotype. In other words, a young, intelligent person becomes a typical moron bureaucrat.

It is true that a few continue to resist pressure, unmindful of punishment or incentive. But the number of such bureaucrats is very small. But these is a relatively large number who, having succumbed to pressure, continue to feel dejected and disappointed but yet perform routinised bureaucratic functions like robots. This is the group of people who are perhaps sitting on the fence and, given the right kind of environment and socio-political development, would jump to the other side, but will not initiate the process of change by themselves. At the other extreme are a large number of people who easily and comfortably shift to or continue from the beginning to enjoy the stereotyped role of bureaucrats. A very insignificant few find the existing system in conflict with their ideological commitment and protesting get out of the service voluntarily.

There are two other important limitations of the bureaucracy. First, there is the age-old tradition of India's state administration, which has been and continues to be aimed at maintaining and safeguarding existing property relationship. In fact, all the procedures — civil and criminal laws and judicial procedures and practices — are oriented towards safeguarding property ownership and resultant production relationship. The bureaucracy is specifically trained in this basic traditional ethos of administration. This in turn strengthens the second but most important binding constraint, that is, the caste-class background of the bureaucrats. There is a clear tendency of coalescing of interests between the bureaucrats and the landlord-capitalist-comprador class. A very senior bureaucrat of a State in charge of land reform, for example, had no hesitation to say, "How do you expect me to implement the land reform measures which are going to hurt my father and several of my relatives?" Even when the bureaucrats have no connection with land — coming from urban middle class without any linkage with the landed gentry — they seem to maintain an attitude of either hostile neutrality or a conspicuous paternalism towards the downtrodden proletariat. At the other extreme, where caste-class feelings are traditionally strong and nurtured by feudal or semi-feudal production relationships, the bureaucrats fail to take an impersonal and officially legal stance in the event of caste-class struggle. A Rajput Collector in Bihar, for example, did not find it unethical to publicly assure the Rajput landlords of all official help and support against the minimum wage demand of low-caste landless labourers. The Adivasis and the Scheduled Castes are so increasingly victimised.

As a result, when the benefits of the special development projects (for example, SFDA, MFAL, land reform, cooperative credit, tribal development, etc.) specifically targeted for the downtrodden do not reach the target group and are instead grabbed by the richer class, it does not disturb the bureaucrats as it should. That most of the benefits of the target-group oriented programmes are going to be grabbed by the non-target group, that is, the socio-economically richer sections, is almost accepted both officially and unofficially as inevitable. In fact, there seems to be a "one-third syndrome" of efficiency running across the bureaucracy in the sense that there is a great fanfare of appreciation if benefits reach at least 30 per cent of the target group.

What then could we expect from the bureaucracy in relation to people's development? Given its nature and character, we cannot expect the bureaucracy to bring about any fundamental socio-economic change. Neither can we expect the bureaucrats to have empathy towards the downtrodden proletariat in order to encourage them to actively participate in the development process. It would be utterly naive of anyone to think that the bureaucrats, as they are, will have time, patience, willingness and empathy to organise the largely unorganised downtrodden proletariat in order to turn them from a mere receiving system to a demand system. For, the very process of organising the poor proletariat in an articulate and vigilant demand system defeats the interest and authority of the bureaucracy, though there may be and often is a general feeling among some bureaucrats and ruling politicians that it is necessary to organise the poor into a demand system. As explained earlier, much of these feelings and official utterances are the result of a vague hope that somewhere, somehow, somebody will do the job of organising the poor into a demand system without hurting or depriving the bureaucrats, own interests and power. On the other hand, there is clear historical evidence to prove that whatever so-called radical or liberal measures or poor-oriented development programmes the existing socio-economic-political structure has undertaken are direct or indirect result of some form of class struggle threatening the balance of political power. Most of such development programmes are at best ameliorative and at worst a simple mechanism of hoodwinking the unorganised poor with false promises in order to divert or diffuse the class conflict, without any change in the socio-economic power structure. In fact, the bureaucracy is usually found to take the side of the existing structure in any class conflict to the extent that it even promotes or instigates a counter-organisation of the rich to deal with the organised and legal demands of the poor.

It is often argued that what is needed for the people's development is a 'well-knit and well-ordered structure of administration'. Some people even think that there is no alternative to "this basic requirement". Having made the prophecy, the same people then argue that this so-called well-knit administration of bureaucrats will deliver the goods only when it is properly directed by the democratically elected political leaders. The fallacy in this argument is obvious. It is inconceivable that such political leadership with sufficient strength can come up from the existing power structure as to direct and compel the bureaucrats to organise and educate the poor into a demand system. On the contrary, with the coalescing of interests of the bureaucrats and ruling power structure, their basic aim is to resort to repression or urge the oppressed and the poor to be cautious in pressing for any basic change in the present socio-economic structure.

It is often pleaded by some that the only alternative approach for people's development without class struggle and basic institutional change is an approach of technological innovations and gradual incremental reforms. Among this group of people there are a few who wishfully believe that by the sheer force of history and democratic processes, the present political leaders will increasingly learn to align themselves with the downtrodden and to consider the proletariat as the stable constituency or vote bank. Once this happens, they would force the bureaucracy to implement the development programme for the poor and with the poor as a process of people's development in order to maintain their hegemony. Either the protagonists of this gradualist thesis are blind to the historical process or they refuse to learn from history. Apart from the inordinate delays with various interacting unknown forces in achieving this gradualist stage, people's development cannot and will not take place by merely forcing the giver-bureaucrats to streamline the delivery system. Attempts to push through such a strategy of development and change, in the absence of basic changes in the socio-economic power structure, only result in retardation, frustration, discontent through preventing large masses of latent productive forces from participating in the process of development.

The only way therefore is to turn upside down the existing pyramid of socio-economic power structure, with only 10 per cent of the ruling elite and urban white collar workers at the top, thus bringing the organised poor and downtrodden proletariat to the top. This is possible only when there is a genuine people's development programme in educating, politicising, and organising the poor with class solidarity and continuous class struggles.

For the present, it is sufficient to conclude that bureaucracy as it obtains in the present socio-economic order cannot organise people's development; at best they could operate as givers in a moth eaten and often corrupt delivery system. If the pyramid of power structure can be turned upside down, it is possible that a large part of indifferent and hesitant bureaucrats sitting on the fence will gain courage to join the proletariat for people's development. ☐

Politics of Protection : A Bihar Study

A.K. LAL

PROTECTIVE discrimination as a policy to steer the process of mobility among the depressed classes seems to have become a fact of life in India. It has profoundly affected the course of change among these communities and has helped cause a major breakthrough in ameliorating their condition. Giant strides have been made in laying the infrastructure to sponsor upward mobility of the historically disadvantaged through the policy of protective discrimination. In fact the 'coming up' of the exploited people "from the lowest estate into which any people have ever fallen anywhere at any time in human history" has been rendered feasible through preferment in both education and jobs.

In modernising society the relationship between mobility and education is an intimate one. Education is not only an effective means to social mobility but a prime mover of change so far as these communities are concerned. Protective discrimination has gone a long way in promoting spread of education among the scheduled communities. Special provisions to benefit such communities as have no tradition of education have led to steady growth in enrolment to various institutions of learning. The representation of the scheduled communities at various levels of education has been greatly helped by the parallel changes in the economic structure. The importance of education increased as it became an important agency to inculcate skills required for taking up career positions in the modern diversified occupational structure. Education no longer remained primarily a conservative and culture-transmitting institution. These people, lying at the base of the traditional hierarchical structure, have found in education the necessary avenues for status elevation through acquisition of particularistic traits of status elevation. A good number of the one-fourth population of Bihar described as the scheduled communities have found entry into Government, business, education and politics. This has led to the creation of an educated professional elite among them. Entry into Government service remains the primary avenue for the mobility of the educated among the weaker sections of society.

These professional elites as well as political activists and social workers are reported to have exerted effective influence on the course of changes within their community. They have turned out to be viable units of guidance and direction for their unschooled brethren. Functioning as a bridge between the bulk of the illiterate people and the larger society, these groups are often the modernisers in the process of social transformation, initiating, stimulating and accelerating it. They have operated as 'standard setters' and 'symbol builders'. As a demonstration unit or reference model they have been found capable of affecting the behavioural patterns and attitudinal dimensions of their community members in a significant way. As catalysts and sustainers in different types of organisations they set the tone and determine the direction of change. Such elites have provided leadership to various associative activities and collective strivings aimed at activating the community.

There are instances when these have been found to be integrated into the 'supra unit' of which they are an internal elite. In effecting the alteration of the socio-economic contours of a traditional society, oriented to modernisation, the elite through their resources, talents and links have made a significant contribution. They have been found to be experts in performing mediatory functions through action-sets and focussed networks. They are important links between the supplicants of the community members and the administrators. Their resource disadvantage has ceased to be cumulative. Redemption from defiling jobs, and participation in modern occupations have brought them in close proximity to the secular, egalitarian and 'ritually neutral work spheres' of city life. This has liberalised their relationship with the privileged commmunities. A natural outcome of this improvement has been lesser disabilities for financially and educationally better off members of the scheduled communities. With the cooption of these people with the elite of society, a move towards greater integration has been started. Elevated socio-economic standing of these community elites has enabled them to be closely linked to the middle class among the upper castes. This in turn is considered conducive to the integration of the emerging elite with the larger society.

This should not lead one to construe that the process of emancipation of the scheduled communities is complete. On the contrary, it is a long way off. Disabilities continue to exercise profound influence, especially in the countryside. The scheduled communities are more subjected to humiliation in rural areas than in urban areas. The antipathy towards neo-literates from these communities is pervasive. Urban heterogeneity may afford a relative sense of anonymity keeping the traditional ascribed status in temporary abeyance. In the long run, however, the 'dominant status' of these people remains the overriding status. There is also evidence to show that the mobility of the scheduled communities of Bihar towards higher ranks in Government service is very slow (Dushkin, 1972. — *Untouchables in Contemporary India.*)

Though politics in Bihar has come to be articulated in terms of the backward vs the forward,

Dr Lal teaches at the A. N. Sinha Institute of Social Studies, Patna. This contribution is based on a paper he presented at the All-India Sociological Conference at Dharwad (February 26-27, 1982).

leaders from the scheduled communities have remained the appendage of the dominant castes. While in power they tend to represent the apparent centre rather than the real centre of power. They act as a rubber stamp of the primary leader. Power marries better with wealth and ritual status than with number. The various units among them work at political cross purposes.

The greatest shortcoming of the policy of protective discrimination lies in its failure to ensure fair and equitable distribution of facilities among the different sections of the beneficiaries. Benefits meant for the scheduled communities have remained concentrated at the top. These have not percolated effectively downward in the hierarchy. Only those having a head start have increased their lead. Representation in politics tends to be confined to a few castes and tribes among the scheduled communities. Within the communities that have been successful in hogging the benefits of protection, a gap has been created between the masses and the emerging tiny elite. There are evidences to suggest that educated people lose their moorings and are cast adrift without any goal. They find solace in anonymous retreat. They move into what Isaacs in his book *India's Untouchables* (1965) calls a kind of 'semi-limbo' pulling up and away "from the sudden bleakness of their past estate, but do not quite get nowhere, but neither do they reach somewhere."

For those who are at the bottom of the heap, poverty is rife and there are fewer opportunities. Their mobility aspirations and achievements remain less spectacular. Thus the policies could not take care of the lowest among the lowly. Distribution of resources has been determined by the existing social class boundaries. The poor among them lead a bleak existence, always threatened by the uncertainty of getting their next meal. The benefit of Green Revolution which lifted the big and medium farmer to the orbit of influence have sent these people hurtling into an abyss of poverty. Many of them are dependent upon the caste Hindu patrons finding themselves in semi-indentured or bonded relationship. Since these communities provide the bulk of labour in the countryside they are seen as the highest threat to the existing semi-feudal mode of production. Nowadays they are being coerced to accept the exploitation of the upper castes through violence. Unabated atrocities on the depressed classes, their killings with frightening regularity and acts of reprisal are grim reminders of the futility of the policy of protective discrimination for the helpless among these communities.

The availability of reverse discrimination to other backward castes is only a recent phenomenon in Bihar. These constitute the latest addition to official protection. Included in the Janata Party manifesto (1977), the policy of protective discrimination for these categories was finally promulgated in late 1978. The provision of protective discrimination for the other backward castes include reservation of 20 per cent Government jobs for 128 such castes. All of these belong to the middle-range Hindu castes. Economically weaker sections of the upper castes have also been entitled to 3 per cent of Government jobs while the other 3 per cent are reserved for the weaker sex.

Extension of reservation to the backward castes after a bitter struggle signifies many things. It heralds an important landmark in the history of political modernisation in Bihar. It represents a situation wherein a number of castes inducted only recently from the periphery to the centre of political universe refuse to be the appendage of the main contenders in power politics — the upper castes. The retention of political dominance by the upper castes long after traditional sanctions for superior status have been impaired spurred the 'ascendant castes' to organised action to challenge the supremacy of the former. A number of cognate caste groups conglomerated themselves into a federation to stake their claims for their 'due share' in the modern diversified occupational structure. In order to compete with the upper castes who had a head start in capturing the modern sources of status because of their inherited superiority, the federation sought shelter under the protective umbrella of reverse discrimination. The backward caste people agitated for reservation of caste quotas for jobs in the administrative services and seats in arts, technological, medical and science courses. The coming together of these castes is not a simple exacerbation of the parochial activities of narrowly circumscribed lesser identities and undissolved residue of traditionalism. It marks a clash between the established and the emerging holders of power.

The collective strivings of the backward caste people (OBC) was oriented towards removal of discrepancy between the different attributes of their secular status. Their increasing strength in the legislature prompted them to seek parallel elevation in the hierarchy of modern diversified occupational structure. They did not claim and dispute rank precedences. Protest against their conditions of relative deprivation seemed to be the dominant theme of the backward caste movement. Exposure to egalitarian values and attainment of higher levels of education promoted awareness of the negative discrepancy between legitimate expectation and actuality. This realisation of their dominant political status made them capable of initiating the process of struggle. The 'substantialisation' was against their discrimination in the socio-economic field. The opposition reference group happened to be the upper castes who are the biggest appropriators of modern secular resources.

It represents a big leap to ensure distribution of resources in an egalitarian manner. It challenged bureaucratic manipulation of modern resources in favour of the privileged few. Dominance of the upper castes has led to the perpetuation of their traditional hold in the modern setting by acquisition of the new resources. In a bureaucracy which is not oblivious to caste, kinship and religious pulls, assertive discrimination in favour of those who are under-represented are bound to be sought.

It is true that the economic policies of the post-Independence phase have been highly in favour of the rise of kulaks in Bihar from among the 'Other Backward Castes'. But there are evidences to indicate the continuation of mass poverty among these people. Caste hierarchy has been and is still indistinguishable from economic hierarchy. Among the Hindu land-owners in Bihar in the early twentieth century, there were rarely found members of castes other than the upper castes. Even as late as 1951 about 80 per cent of all landowners in Bihar were from these castes. According to a recent estimate, the Other Backward Castes constitute the bulk of poor and middle peasantry, whereas only 3 per cent of the upper castes are in this economic group. Similarly 80 per cent of the 16 per cent population of Bihar holding 60 per cent of the cultivable land holdings are from the upper castes. Thus, in spite of the rise of the kulaks from among these communities, they are essentially a deprived lot. In Government occupations also they are far behind the upper castes who hold 80 per cent of the positions in the bureaucracy. They remain under-represented in spite of educational attainments. The demand for job quota for backward castes is further justified in a situation where merit, efficiency and virtues are coterminus with caste.

Since the facility is quite new for the backward castes, its implications for them are not exactly known. One can however predict that this too is likely to be distorted to buttress the rich and advanced people among these castes. It is likely to remain stuck with the four comparatively advanced backward castes — Kurmi, Yadav, Baniya and Koeri. The apprehension grows out of the fact that these four castes in themselves are the highest representatives of the backward castes in the legislature, bureaucracy and education. According to figures available in 1978, 91 of the 94 legislators belonging to the backward castes were from these castes. Similarly, of the 216 gazetted officers belonging to Other Backward Castes only seven belong to other castes. They have been the largest beneficiaries of the educational facilities, consuming as much as 98.6 per cent of the total provision for scholarships and stipends meant for the backward castes.

The scheme is against the upper castes. The rigours of reservation are to be felt by these people. The youth of these castes find themselves twice deprived. They had made a violent protest against the extension of this scheme to the Other Backward Castes. The scheme provoked the envy and ire of these people. It turned the whole of Bihar into a cauldron of caste tensions. The situation was highly inflamed. Trouble spread quickly and tension assumed frightening proportions — there was a wave of violence in Bihar. Though things have softened with the passage of time, there is still a strong backlash against the reservation policy. Misgivings against the scheme of protective discrimination have been accentuated.

To sum up, protective discrimination is one of the many measures aimed at reallocation of resources on egalitarian lines. It is affirmative state action to compensate the historically and structurally disadvantaged for their disabilities. It is a compensatory programme available to those who cannot hold their own. If the policy was initiated to correct the damage caused by the traditional ascriptive stratification, its extension to newer strata indicates the failure of the state to prevent continued appropriation of modern resources by the entrenched few. If the sins of the upper castes are responsible for its arrival immediately after Independence, its increased clientele is the product of upper-caste manipulation to keep others stagnant. The diminished political clout of the upper castes made them accept the increased applicability of reservation. Similarly, the increasing power of other castes has prompted them to successfully strive for corresponding elevation with regard to other status attributes.

The experience of the execution of the policy of protective discrimination reveals its ineffectiveness among the lowest of the lowly. They are in great number. The policy has helped the creation of a new schism and perpetuation of the old ones. It needs to be radically reoriented in favour of those who deserve it most. Among the depressed communities it should first go to those communities that have been left untouched. Among these also, the poorest should get first priority. Only then can the policy be justified as a measure of resource dispersal.☐

Should India Go Nuclear?

KRISHAN KANT

I must pay my compliments to the Rifle Association for holding such lectures for a number of years as a part of the military education programme. This is an area of education and knowledge which has not yet been integrated into a national framework as in many other countries. That is why no debates on different aspects of national defence take place in the country. We bestir ourselves whenever there is an attack from Pakistan or China or there are reports that their defence preparedness could pose a threat to our security, and after a few months the discussion dies down. This lack of sustained interest and knowledge is also reflected in the debates in both Houses of Parliament. Very few members — not even reaching two digits — have adequate knowledge of the changing strategic environment with which the country's national defence has to cope. So far no tradition for genuine national security debates has been built up. Another factor which inhibits such debates is the attitude and policy of the Government not to place before the public from time to time an appraisal of the strategic situation based on facts and an absurd concept of secrecy that has been perpetuated by successive administrations. In such a climate, the efforts of your organisation are praiseworthy. I do hope a new defence consciousness will grow out of efforts such as this.

It is rather unfortunate that even 34 years after achieving Independence, India needs a debate about its geostrategic and historical role and we are yet to define and discover what our national security priorities are. Our national mind hovers between our supposed national mission of peace and friendship on the one hand and the national imperative to keep the nation strong enough to meet all possible eventualities on the other. We do not seem to have learnt any lessons from our experience. Jawaharlal Nehru's role and image as world peacemaker and founder of the non-aligned movement suffered a serious blow when the Chinese marched into India and humiliated the nation. They are still holding on to 40,000 square miles of our territory. A national hero and a rising Ashoka passed away licking the wounds inflicted by the Chinese *bhai* and Panchsheel partner. The country showed deference to Nehru but will not forgive any ruler, political leader or party if he, she or it continues to waver between the two extremes and is not able to find a balance and there is to be yet another failure to safeguard our security in the fullest measure. A weak leadership cannot play any role in nation-building, nor can it keep the country together. Weakness is the biggest curse for any nation or leadership.

The nuclear debate in this country depicts a split mind. We started thinking about it when China had its first nuclear explosion in 1964 and followed it up with missile tests. The debate in India waxed and waned depending upon the frequency of Chinese tests. Recently a similar situation has arisen vis-a-vis Pakistan. Excepting for an infinitesimal minority, the Indian political, administrative, social and economic elite are united on one point, that if Pakistan makes a bomb, then there will be no option left to India but to make one also — as if India exists only with reference to Pakistan and has no independent regional or global identity and a role of its own. If India had developed its nuclear defence system and doctrine following the Pokharan test such a situation would not have come about. Yet various polls conducted by our media have revealed that our people have always been in favour of the country acquiring nuclear weapon capability.

This hesitancy to exercise nuclear option until today not only in the political leadership but among the economic, social, academic elite is attributable to our not being clear in our mind as a nation what is the destiny of India and how we should try to fulfil it in the geostrategic situation in which it is placed. It is time we brought some definition to it. Otherwise the drift may cost us very heavily.

Many among the elite feel that India has a natural role to play in promoting a climate of peace and friendship in the world by virtue of the Indian heritage and especially that left to us by Gandhiji who conducted the entire national struggle through the instrument of non-violence and satyagraha. Nehru attempted to extend the Gandhian concept to international relations through non-alignment and the concept of peaceful co-existence. The non-aligned movement helped in reducing the tension in the super-power confrontation and prevented it from escalating. Today the role of non-alignment is widely acknowledged. Given this background in which our perceptions and policies originated, it would be quite pertinent to analyse Gandhiji and the peace movements in the world. Here I may make it clear that I am not referring to the movement led by the World Peace Council under the leadership of the Soviet Union, which is itself a nuclear super-power. The Soviet Union, in order to safeguard its own security vis-a-vis the United States and to ensure its place in world affairs, decided to develop its own nuclear weapons. And I must say it was a correct decision in the interest of their nation. The Soviet leadership was clear about their national destiny and geostrategic situation.

The author is a former Member of Parliament. This contribution is the text of the Capt. G.V. Modak Memorial Lecture delivered by him under the auspices of the Ahmedabad Military and Rifle Training Association at the Military Education Campus, Khanpur, Ahmedabad, on February 19, 1982.

Gandhiji was no doubt a war resister but not a pacifist. He stood for abolition of war from the world by struggling against it and not by staying out of it. He was not a Utopian but a realist. He preferred violence to cowardice. He worked for inculcating a spirit of resistance against injustice, inequity and domination and for lifting entire mankind towards equality of opportunity and dignity. His basic approach was quite different from that of a person like Bertrand Russell. Russell refused to participate in war or war effort.

Gandhiji participated in the Zulu war in South Africa in the Red Cross. After his return to India he worked to persuade the Indian people to join the army on the side of the Allies in the First World War of 1914-18. He was decorated with Kaisar-i-Hind medal for his services which he renounced in the wake of the Jallianwalabagh tragedy. Even in the Second World War, he had no objection to the Congress taking up the reins of government and participating in the war effort against the Japanese. The Congress wanted an Indian to have the defence portfolio (in their negotiations with the Cripps mission). The defence of India, they argued, should be in the hands of Indians.

Bertrand Russell urged individuals to refuse to fight and said pacifists were justified in emigrating to a neutral country. Russell himself was in America during the Second World War, though it did trouble his conscience as he wrote to a friend in July 1940: "We constantly wish we were in England — it is like being absent when someone whom one loves very much is dangerously ill. But the children and the need for earning money make it impossible." Much of the pacifism amongst the intellectuals and so-called sane policy makers is similarly motivated by 'children and the need for earning money.'

Gandhiji's motivation was different. His ideals and practices were born out of deeply held idealistic convictions as well as realism based on the level of mental and spiritual development of his own people because he wanted the people as a whole to be elevated in their consciousness and norms through the struggle. He was also conscious of the inherent limitations of mankind. He would not prescribe his own standards and approach for which he had prepared himself by constant internal struggle, a kind of *tapasya*, to ordinary people, for he knew the populace was dominated by fear and anxiety and deeply devoted to comforts and pleasures of life and the Governments as they were constituted were essentially based on violence. His prescription would be to meet their short-term needs in a pragmatic way but at the same time in the direction where they could rid themselves of fear over a period of time and move the state from violence to popular cooperation and support which would enable the state to function progressively with lesser violence.

Gandhiji would never have left his post of duty with the people and moved to a neutral country. He would have devised a strategy for the people which would strengthen individuals and society morally and spiritually to resist an invader. He would have even defended and supported violence or war when individuals, groups or nations could not find any other way to resist evil, injustice and occupation. He would not adopt a holier-than-thou attitude as many pacifists do. Let me draw attention to some quotations from Gandhiji which will make my point clear:

> "Non-violence is not a mechanical thing. You do not become non-violent by merely saying 'I shall not use force'. It must be felt in the heart...When there is that feeling it will express itself through some action" (pp 506-507. *The Last Phase*; *Harijan*, March 9, 1940, p 31).
>
> A question was put to Gandhiji, "Suppose someone came and hurled an insult at you, should you allow yourself to be humiliated?" He answered, "If you feel humiliated, you will be justified in slapping the bully in the face or taking whatever action you might deem necessary to vindicate your self-respect. The use of force, in the circumstances, would be a natural consequence if you are not a coward (p. 506, *The Last Phase*; *Harijan*, March 9, 1940, p 31).
>
> Another question: "Supposing in the presence of superior brute force, one feels helpless, would he be justified in using just enough force to prevent the perpetration of wrong?" Gandhiji answered, "Yes. But there need not be a feeling of helplessness if there is real non-violence in you. To feel helpless in the presence of violence is not non-violence but cowardice. Cowardice must not be confused with non-violence." (*Harijan*, March 9, 1940, p 31).

The issue to be assessed is whether the people of India and especially the so-called peace enthusiasts and unilateral disarmers have developed that spirit of non-violence to an extent that they are not feeling helpless before superior brute force.

Gandhiji was an evolving man both in his search for answers and in preparing the nation for the ultimate goal, while being completely realistic in his perceptions of the situation he was living in and functioning.

Here are a few other quotes:

> A question was asked: "Is it possible for a modern state, which is essentially based on force, to offer non-violent resistance for countering internal as well as external forces of disorder?" Gandhiji answered: "It is not possible for a modern state based on force non-violently to resist forces of disorder, whether external or internal ... (but) *it is claimed that a state can be based on non-violence*, that is, it can offer non-violent resistance against a world combination based on armed forces. Such a state was Ashoka's. The example can be repeated". (p 510, *The Last Phase*; *Harijan*, May 12, 1946, p 128).

The issue is whether Indian rulers and people have renounced war as Ashoka had done. Have they reached a stage of moral and spiritual development when they are capable of renouncing war and violence? Or are these only academic or theoretical propositions propounded by those sitting in ivory towers of the Gandhian era when it was left to Gandhiji to thank and decide?

Gandhiji was aware of the lack of answers to issues arising out of the situation when India became independent and decided to keep an army. There is a relevant and interesting discussion between General Cariappa and Gandhiji. The General asked, "I cannot do my duty well for the country if I concentrate only on telling the troops of non-violence all the time, subordinating their main task of preparing themselves efficiently to be good soldiers. So I ask you, please, to give me the 'Child's Guide to Knowledge'.... Tell me, please, how I can put this over, that is, the spirit of non-violence, to the troops ... without endangering their sense of duty to train themselves well professionally as soldiers....” Gandhiji replied, “You have asked me to tell you in a tangible and concrete form how you can put over to the troops you command the need for non-violence”. Half closing his eyes he added, “I am still groping in the dark for the answer. I will find it and give it to you some day”. (*The Last Phase*, p. 524).

I do not know if the protagonists of peace and unilateral disarmament who advocate abjuration of nuclear weapons for India have been able to find the answer which Gandhiji thought he was still to find and hoped to give some time. He, unfortunately, did not live long enough to find the answer and give it. This question was with him earlier even in 1928 when he wrote in *Young India* of September 13:

> “If there was a national government, whilst I should not take any direct part in any war, I can conceive of occasions when it would be my duty to vote for the military training of those who wish to take it. For I know that all its members do not believe in non-violence to the extent I do. It is not possible to make a person or society non-violent by compulsion” (p 508, *The Last Phase*).

Whether it is a question of military training, keeping an army, or equipping the army with modern sophisticated weapons, the relevant considerations are the same as were before Gandhiji in 1928. I shall deal later with some of the considerations which should weigh with us.

Gandhiji did not ask Nehru or the Government of independent India to renounce war or not to keep the defence forces. It may not be out of place to refer to another aspect — the Pakistan question — while we are on Gandhiji’s approach. This might help us in reaching realistic conclusions. It is again from *The Last Phase* (p 476).

> “At the prayer meeting on September 26, Gandhiji remarked that he had always been an opponent of all warfare but if there was no other way of securing justice from Pakistan, if Pakistan persistently refused to see its proved error and continued to minimise it, war would be the only alternative left to Government. War was no joke. That way lay destruction, but he could never advise anyone to put up with injustice. If all the Hindus were annihilated for a just cause he would not mind it. True, his own way was different, he worshipped God which was truth and non-violence. But then, he was not the Government”.

Gandhiji in his private advice to Nehru and the Government of India did not disapprove of the Indian Army being sent to Kashmir and gave his best wishes when Brig. Sen went to Gandhiji for his blessings before flying to the frontline in Kashmir. He spoke publicly also about it, and here is an extract from *The Last Phase* at (p 502):

> “When the Kashmir invasion by the tribesmen was at its height and the invading army composed of Afridis and the like, ably officered, was advancing upon Srinagar burning and looting villages all along the route, Gandhiji remarked in one of his prayer addresses that it was difficult to believe that this intrusion could take place without some kind of encouragement from the Pakistan Government. He could not escape the conclusion, he said, that Pakistan Government was directly or indirectly encouraging the raid. The Chief Minister of the Frontier Province was reported to have openly encouraged the raid and had even appealed to the Islamic world for help. It was, therefore, right for the Union Government to save the fair city by rushing troops to Srinagar. He would not shed a tear if the little Union force was wiped out bravely defending Kashmir like the Spartans at Thermopylae nor would he mind Sheikh Abdullah and his Muslim and Hindu and Sikh comrades dying at their posts in defence of Kashmir. That would be a glorious example to the rest of India. It would make the people of India forget that the Hindus, Muslims and Sikhs were ever one another’s enemies”. Pyarelal continues: “Some people were shocked by Gandhiji expressing his appreciation of the Indian Union Government’s action in sending troops for the defence of Kashmir. His exhortation to the defenders to be wiped out to the last man in clearing Kashmir soil of the raiders rather than submit was even dubbed Churchillian”.

So the basic difference between Gandhiji and the pacifists must be properly understood to clear the confusion in the national mind. Writing in the pamphlet ‘For Pacifists,’ he said that he would “rather have India resort to arms in order to defend her honour than that she ... in a cowardly manner become or remain a helpless witness to her dishonour.”

Undoubtedly he would have liked India to become non-violent and brave — but after raising the citizens to that level. In reply to a question, “Will free India carry out total mobilisation and adopt the methods of total war?” Gandhiji answered, “I cannot say whether free India will take part in militarism or choose to go the non-violent way. But I can say without hesitation, if I can turn India to non-violence, I will certainly do so. If I succeed in converting 40 crores of people to non-violence, it will be a tremendous thing, a wonderful transformation”. (p. 508, *The Last Phase; Harijan*, July 19, 1942, p. 234).

Stephen Cohen in his book *The Indian Army* compares Gandhiji’s and Nehru’s attitudes. According to him, Nehru was a Fabian anti-militarist while Gandhiji was not.

It is for the rulers of Indian and the protagonists of the abjuration of India nuclear option to judge for themselves whether they have been able to convert the 70 crore people of India to non-violence. They should first ask themselves how much they have been converted to non-violence in their personal or societal relations in the country. As is obvious from the above, Gandhiji would have advocated and taken the country to the non-military way only after successfully converting the population of India to non-violence and not pacifism.

Bertrand Russell and many others of his way of thinking reached a point where they considered the survival of man to be more important than any other consideration — ideological, political, national or territorial. In his essay, “Inquiry into Meaning and Truth” he commented, ‘I feel the only thing I can do for the world for the moment is to try to preserve as much as possible of our persisting civilisation, in the hope of renaissance in a thousand years’. Many Indians took inspiration and approvingly quoted Russell at the time of the border conflict with China. Betrand Russell wrote, “This (great hour) is fateful for India and her friends. But unless every serious effort is made to prevent an extended conflict with China, and unless this is the first priority of Indian policy, even if territorial loss is involved, democracy in India is doomed. Democratic institutions will not survive even a few months of full militarism and economic advance will be permanently halted”.

Probably for him survival was more important than human dignity. If this argument is taken to its logical conclusion, Russell's life-long struggle becomes illogical. All struggles that the Namibian and the South African peoples are waging would become obsolete because the South African Government possessing atomic weapons may use them as a last resort to keep control over their territories and the system of Apartheid. According to the Russell logic, which he espoused in the last stages of his life, mankind must wait for inner contradictions to destroy the dictators and imperialists rather than wage struggles for freedom and human equality. Can the movement of history and people's urges for equality be curbed because of dangers of physical suffering and even threat of annihilation? Would Gandhiji have agreed to that? He was basically a resister against evil, dominance and injustice and would not give in, whatever the threat. He would not approve of the peace of the grave. Perhaps the pacifists would prefer that kind of peace for personal suruival!

At least one can understand those pacifists propagating non-nuclear as well as non-military course of action for nations. It is however difficult to understand others who support the acquisition and maintenance of defence forces but would not like India to go nuclear. Their arguments may be divided into four categories:

1. If nuclear weapons are used, there will be immense danger of destruction and annihilation and so India should not go in for them.
2. Nuclear deterrence is of no use. Nuclear weapons have not been used after the Second World War in any conflict.
3. India should not go in for nuclear weapons but try to have a nuclear umbrella or guarantee.
4. Even if neighbours or others make them, India should not. India can meet the challenge with unity and strength of will.

The first consideration brings back to our mind much of the debate of the thirties when air power came to dominate military affairs. Then predictions were made that the next war would be fought by aeroplanes spreading poison gas and disease germs. Bertrand Russell wrote in 1933: "If either side wins the next war (which is unlikely), it will be the side whose young men have shown the most intelligence in chemistry and bacteriology". Speaking to the Fabian Society in 1935 Russell prophesied that air attacks on big cities would mean destruction and panic, involving a total breakdown of food supplies, and launching of millions of starving desperate nomads from the ruined towns on the countryside. He predicted tremendous loss of life and said he was afraid the war would go on until Europe was in chaos, industrialism and ordinary government had disappeared and there were widespread epidemics. Therefore gas-masks were distributed and 'gas drills' were performed by the Army. It was assumed that air raids on London might lead to breakdown of the Central Government. England survived these raids, and so did many other European countries.

No doubt the destruction with atom bomb will be much more severe and costly to the human race. This scenario should be applicable to all and not merely to India. According to a UN report even countries which do not possess the weapons will suffer if there is a general nuclear war between two super-powers because of radioactive fallout. But one should distinguish between a limited nuclear war between two countries with a few bombs and a general nuclear war involving the super-powers. In the former case the destruction will be somewhat greater than in the Second World War but countries will survive. In case of nuclear war between the super powers, civilisation will perish.

Such arguments would lead one to assume that the objection would be met if nuclear weapons of reduced lethal power or capacities could be developed which come to more or less the level of conventional weapons. Continued underground testing has produced nuclear weapons of very low yield, down to 0.1 kilo ton according to some reports. It has also produced a variety of options between heat, blast, shock and radiation. In yield there are now available a range of nuclear weapons which compare with advanced conventional weapons. The conventional fuel air explosive has five times the explosive effect of TNT and an FAE dispenser with 0.1 kilo ton equivalent is possible. The closing of the gap has obvious significance in overcoming the so-called 'fire break' principle, which has been observed since 1945. Reduced radiation nuclear weapons have been developed since early the 1960s which enhance blast and heat and produce very limited radiation.

It should be remembered that the advanced conventional weapons are today as lethal as low yield nuclear weapons. Ten times more people than in Nagasaki and Hiroshima were killed in Manchuria in the Second World War. In Nagasaki and Hiroshima about 2,00,000 were killed. Hitler killed six million Jews. In the 1000 bomber raids on German cities and fire raids on Tokyo more people were killed than in Hiroshima and Nagasaki. There is no immorality in nuclear weapons themselves if we decide that we will not be the first to use them but have them only for deterrence. This is the position in regard to poison gas under the Geneva Convention. As a Major in the Army told me: "The country has decided to keep an army, an air force and a navy. It means the nation has decided that our forces will kill if necessary to defend the country. The question is what is the best strategy to maintain the sovereignty of the country and dignity of its citizens. If you have decided as a policy that we will go and kill our enemies at the risk of our lives, then the risk to our lives must be minimal. Only then the defence forces can remain strong and face any danger. If the defence forces know that the enemy has the ultimate weapon of the present times, the morale of the forces cannot be kept".

It will be unpatriotic and stupid of the Government and the country's elite to throw our forces into the jaws of death knowing full well that they have to face the ultimate weapon on the other side. The honest course in such a situation would be for the Government leaders and the so-called intellectual elite to lead the fight against the enemy and demonstrate their moral courage and not ask the jawans to face sure death and defeat. Therefore, the political and the intellectual elite must search their hearts first and come out honestly and say that they are asking our jawans to take impossible risks with the odds totally against them. An army will fight only when it is confident that the people of its country have done their best to equip it. If it develops doubts on that score, that army will not fight when the war starts.

The second argument that deterrence has no use may be looked at from the point of view of historical experience. Where only one side has the weapon the situation is very different from one when the two adversaries have limited nuclear arsenals. Threats in such asymmetric situations have worked:

1. After the Second World War in 1946 the Truman papers show the US conveyed a nuclear threat to the Soviets to withdraw their armies from Iran and it worked.
2. When the Panmujom talks were stalemated during the Korean war, Eisenhower is on record in his book *Mandate for Change* that he conveyed a nuclear threat to the Chinese and the talks did come to a conclusive stage.
3. Eisenhower conveyed a nuclear threat to the Chinese when they were bombarding the Quemoy-Matsu Islands with a view to annexing them. The Chinese wanted the Soviets to give a counter-threat in their support but the Russians dilly-dallied. The American threat worked and it was then that the Chinese decided to have their own independent nuclear deterrent.
4. During the 'Ussuri River Crisis' on the Soviet-Chinese border, it is said that the Russians gave a nuclear threat to China to stop nibbling at the border and it worked.

There were two other occasions when such a threat was considered or is supposed to have had its effect:

1. During the Vietnam War when the US troops were faced with a difficult situation at Khe Sanh, considerable discussion took place in the US about the possible use of nuclear weapons. Probably the counter possibility of use by the Soviets deterred them.
2. A section of the leadership in the US feels convinced that it was the USS *Enterprise* having nuclear weapons on board sent into the Bay of Bengal in 1971 that deterred the Indian leadership from dismembering Pakistan.

If in various conflicts during the last 35 years after the Second World War nuclear weapons have not been used, it is because both super-powers possess nuclear weapons and most of the industrialised countries believe that it was the nuclear weapon which stabilised peace in Europe.

The development of the new doctrine of limited nuclear war has great significance for the non-nuclear nations. US Presidential Directive No. 59 (accepted by NATO allies) regards nuclear weapons not only as a deterrent but also as a weapon to be actually used in a controlled or limited role. If they are used in Europe it will not limit the war. It is bound to escalate because both sides possess enormous nuclear striking power and the existing command and control system cannot limit escalation. So both the super-powers and their allies will think a hundred times before resorting to the 'mininukes' or a demonstration nuclear strike. The real danger is to the non-nuclear weapon states who do not have the capacity to strike back. The Reagan limited-war theories and demonstration strikes may be used only against non-aligned and non-nuclear nations. Also, such doctrines legitimise the use of nuclear weapons by countries like Israel, South Africa and Pakistan. It is in this context that a country like India has to take a decision about its strategy as a non-aligned nation.

Turning to the third consideration of India opting for a nuclear umbrella, it may be pertinent to refer to what Acharya J.B. Kripalani said in the Lok Sabha in November 1964 following China's first nuclear bomb blast. He warned India that it was useless to talk of China's peaceful intentions and submitted that in order to meet China's new threat India would have to look to the West. "We have to rely on the West and we must see that we are assured of their help. If we want to have a deterrent here, it may be necessary for the West to have even bases here as they have in European countries, and nobody has lost his sovereignty because America is helping them." This view of obtaining a nuclear umbrella at any cost from the West was held by many Ghandhians' and peace seekers.

Lal Bahadur Shastri on his first visit to the United Kingdom as Prime Minister probably discussed the possibility of a nuclear umbrella with Prime Minister Wilson. He did not succeed in getting the necessary protective guarantees. If he had succeeded, it would have been at the cost of non-alignment and independence. In 1967, Vikram Sarabhai and L.K. Jha went to the USSR, France, Britain and the United States and explored the possibility of an umbrella when the idea of a non-proliferation treaty was being discussed. But the response was negative. When the Western countries were unwilling to give us even conventional weapons against the Chinese because of their partiality for Pakistan, it was in fact total unrealism that made people look to the West for nuclear guarantees.

The implications of the umbrella have to be clearly understood. Can any guarantee to India and other non-nuclear nations, in general, either unilaterally or jointly, be more credible than the kind of guarantee built into the military alliance system? De Gaulle decided that France must exercise its independent nuclear option despite the NATO guarantee. This decision was based on the French perception that the US would not risk its cities to defend France notwithstanding President Kennedy's categorical assurance on June 25, 1963, that "the US will risk its cities to defend yours". Can India ever hope to get the kind of guarantee that the United Kingdom and France had? In fact, all that the nuclear weapon powers have undertaken under the non-proliferation treaty is to convene a meeting of the Security Council to consider appropriate action. India did not consider it as a credible guarantee.

Besides, such a guarantee would necessitate India to integrate its defence system with those of nuclear powers, stationing nuclear weapons on its soil to be manned by their personnel and having command and control infrastructure. In addition they will even ask that India should not take any independent action even with conventional military forces lest it should escalate into nuclear war. For the US, China and Pakistan are more important strategically and otherwise. They will therefore not give any guarantee against Chinese and Pakistani threats. Consequently we can rely only on Soviet guarantees, if at all any power would give such a guarantee. If De Gaulle did not believe that the Americans would risk their cities to protect France, can we trust that the Russians will risk their cities to protect us against China and Pakistan? The Chinese felt that the Soviet guarantee did not work when they were military allies of the Soviet Union. Incidentally, the Indo-Soviet Treaty does not give any guarantee that the Soviet Union will act in India's defence. It provides only for mutual consultations. When the Chinese attacked India in 1962, the USSR was involved in the Cuban missile crisis, and therefore it was not in a position to support India against China. In such circumstances was issued the famous statement that 'Chinese brothers' and 'Indian friends' should make up. Now the USSR has three more nuclear adversaries. Therefore, if at any time the USSR was engaged in a crisis and at the same time Pakistan or China were to threaten India, can India expect the USSR to come to its rescue?

So no guarantee can be credible. Can India's security be bartered against unsure guarantees? Seeking nuclear guarantees will not enhance India's prestige but reduce it to a laughing stock, especially if we are to look for guarantees against Pakistan. Can such a nation play any role in world affairs?

(To be continued)

Syed Ahmad Khan & Rationalism in Islam

ALI ASHRAF

Sir Syed Ahmad Khan's efforts to reconcile Islam to 19th century liberalism led him to the position of secularism where every human being was a Muslim inasmuch as he abided by the laws of nature, and Islam was only a reaffirmation of these laws. This universalism and freedom of thought which he preached could not go together with opposition to democracy resulting from his aristocratic class bias. The Muslims of this sub-continent had to pay the price for the failure to resolve this contradiction. They appear to be still suffering from its consequences.

— A.A.

SPEAKING on the occasion of 'Sir Syed Day' on October 17, 1954, Dr. Zakir Hussain had said: "Syed Ahmad Khan wanted to build a multi-faceted structure of the national life of the Muslims. He could not complete the whole of it ... He constructed a part from which he expected the future generations to appreciate the entire plan and carry it to completion. But those who came after him turned it into his graveyard ... And in this grave they buried his ideas."[1]

These are hard and bitter words from one who was not given to exaggeration.

The Mohammedan Anglo-Oriental College, Aligarh, which subsequently developed into a University, was but a small part of the comprehensive scheme which Sir Syed Ahmad Khan had prepared for the upliftment of Indian Muslims, and the reformation of their religious and cultural life. Explaining his aims and objects in the sixth issue of his journal *Tahzeebul Akhlaque*, Sir Syed mentioned the following items:

"First, freedom of opinion.
"Second, reforming of religious faith.
"Third, religious ideas and practices.
"Fourth, research and analysis of certain religious problems.
"Fifth, correction of certain religious matters.
"Sixth, education of the young.
"Seventh, making provision for education.
"Eighth, women's education.
"Ninth, promoting skill and the arts and crafts."[2]

The fact that education came sixth in the list did not mean that Sir Syed Ahmad Khan attached less importance to it. But it certainly indicated the kind of education that he desired to be imparted. Education had to be characterised by freedom of opinion, and the reform of religious beliefs and practices which were accorded top priority in his scheme of things.

The main difference between Sir Syed on the one hand, and his detractors among the Ulema and others belonging to various religious schools and sects on the other, related neither to English education nor to the question of joining British Government service.[3] In fact, his two most rabid opponents who took the lead in organising an edict expelling Sir Syed from the fold of Islam, Maulvi Imdad Ali and Maulvi Ilahi Bakhsh, were both in the service of the British Government, one a Deputy Collector, and the other a Sub-Judge. The roots of their difference lay precisely in Sir Syed's ideas of religious reform. They related not only to the relatively minor issues like that of Muslims eating with Christians and Jews, the fact of Christ having been born without a father (which Sir Syed did not accept), human slavery and polygamy (which, according to Sir Syed, Islam virtually prohibited). Differences on these questions reflec-

This contribution is a paper presented by the author at the All-India Seminar on Rationalism and Traditionalism in Islamic Thought (February 26-28, 1982), organised by the Department of Islamic Studies, Aligarh Muslim University.

ted more basic differences on questions of principle as well as of the methodology to be adopted in the exigesis of the Quran. The fundamental aim of Sir Syed's comprehensive plan of reform was to face the challenge of the West by adapting its main ideas to our needs, and to bring about an intellectual transformation among the Muslims of India. The fact that Muslim religious fundamentalism is once again raising its head makes the religious and philosophical views of Sir Syed not less but more relevant today.

Sir Syed's own understanding of his mission was characterised by a sense of continuity from earlier Islam, especially the *Mu'tazela*[4]. The latter, who constituted one of the earliest schools of rationalism among the Muslims, made their appearance as early as the later *Omaiyads*. The essential point of departure of the *Mu'tazela* was that they did not consider human reason to be irrelevant in matters of faith. Maulana Shibli Nu'mani relates that when objections were raised against the repressions and brutalities committed by the rulers belonging to the *Omaiyad* dynasty, the latter offered the plea that man does nothing except what God wills him to do. The victims of their regime of terror, however, found it necessary to tear off the facade of this theological defence of governmental misdeeds. The *Mu'tazela* insisted that blame and responsibility had to be apportioned. They, therefore, enunciated the principle that man, by virtue of his reason and understanding, is free to make his choice. Accordingly, they are also known in Islamic history by the name of *Qadriah*, that is, the sect which believes in man's freedom of choice.[5]

An important point to be noted here, incidentally, is the close relationship between theological and philosophical controversies, on the one hand, and social and political issues, on the other, even in those early times.

In fact, Maulana Shibli has noted that all the religious schisms that took place in Islam, for example, between the *Sunni*[6] and the *Shia*[7], between the latter and the *Khariji*[8], between the *Mu'tazela* and the *Asha'ira*[9], and the *Batinia*[10] were due primarily to social and political causes.[11]

As to which of these schools genuinely represented, in letter and in spirit, the real Islam, Shibli has an interesting theory to offer. He says: "Though like the other religious schools, *I'tezal* was born in the later period of the Prophet's Companions, it was present in an embryonic form in the early years of Islam. To assign the origin of any of these religious schools to this or that period is doing a kind of injustice to it. Either it should be said that in early Islam, that is, during the lifetime of the Prophet and his Companions, none of these religious schools ... existed, or otherwise, it has to be admitted that all of these had already emerged during the Prophet's time."[12]

In other words, Maulana Shibli Nu'mani concedes that the rationalist and the anti-rationalist schools of thought in Islam had both originated during the Prophet's lifetime, and, therefore, from the religious, Islamic point of view, on the basis of deriving their authority from the Prophet, neither of these schools can claim precedence over the other.

The development of *Ilm-e-Kalam* proper (rationalist theology) took place, however, only after translations of the Greek philosophers into Arabic had thrown open the floodgates of new ideas to Muslim society and made it susceptible to new influences. The efforts of Muslim thinkers, however, to reconcile the teachings of Islam, which, in itself, has never been a static concept, to the then-known propositions of Greek science and philosophy, were not unaccompanied by the most bitter controversies and often severe repression.

All this is relevant in an objective assessment of Sir Syed's religious and philosophical views because very often the categories were borrowed from the old *Ilm-e-Kalam*, and if not Sir Syed himself, at least his colleague Mohsin-ul-Mulk sought to justify many ideas of Sir Syed with reference to the authorities from olden times.

For example, Mohsin-ul-Mulk argued in support of Sir Syed by claiming that "the Muslim philosophers in the second century or at the latest by the fourth century (Hijri) had come to understand the reality of nature in the same manner as the philosophers of the present era, and they also said the same things which Syed Sahib says today.'"[13]

Thus, while Sir Syed sought to reconcile Islam with 19th century natural and social sciences, Mohsin-ul-Mulk was attempting a reconciliation between the views of Sir Syed and those of the early philosophers and theologians of Islam. Mohsin-ul-Mulk was a follower of the school of Asha'ira, and the most eminent among them — *Al Ghazali*[14] — had in his writings sought to bring about a reconciliation between the views of the rationalists and those of the orthodox school.

The *Asha'ira*, on the one hand, admitted in accordance with the orthodox position that the *Quran* was eternal in God. But, on the other, faced with the objection that the Arabic language used in the *Quran* showed — like the language spoken by the Arabs in those days — traces of Hebrew and Jewish influence, they maintained that its expression in words and syllables was created in time.

This, too, was the position of Shah Wali-ullah[15] who, in his book *Tafhimat-e-Ilahia* had maintained that only the meaning of the *Quran* was revealed to the Prophet by God, whereas the language used is the one with which the Prophet was acquainted because of his having been born in Arabia.

Sir Syed differed. In order to answer this question in the context of the intellectual milieu of the 19th century, he had to go beyond the bounds of this controversy and pose the whole problem of *wahi* (revelation) on a different plane.

Sir Syed argued that a dichotomy between the meaning and the word is not possible. Ideas always come into the mind clothed in words. But having thus restored the unity of content and form, the meaning and language of the *Quran*, Sir Syed gave an entirely original interpretation of the phenomenon of *wahi* or revelation. The prophets, according to him, were endowed with something like a sixth sense which is not given to ordinary mortals. This he called the trait of Prophethood. *Wahi* or revelation is the response of this extraordinary, Prophetic sense to the developing events in the world. And that is how Sir Syed explains the fact that the Quran was not revealed all at once but only in pieces as the situation demanded.[16]

Having thus bypassed the age-old controversy concerning the eternity or otherwise of the *Quran,* Sir Syed proceeded to lay down a more important and fundamental proposition that the Quran being the *word of God,* and the objective world, as we know it, being the *work of God,* there cannot be any contradiction between the two.[17] This implied that the *Quran* had to be understood not only through the medium of Arabic as spoken at the time of the Prophet, but also in the light of the latest discoveries of natural sciences and in conformity with them.

This, to say the least, was not only a highly unorthodox but also a very dynamic way of *Quranic* interpretation. In this the key, active role is played by human reason.

With Sir Syed reason is the supreme criterion, the ultimate test even of the teaching of religion. Thus in the very first issue of his journal *Tahzeebul Akhlaque,* by way of his testament, he wrote: "After all these considerations, I came to the conclusion that the only means of gaining knowledge, conviction or faith is reason."[18]

Making reason the sole guide in the cognition of reality, Sir Syed had to face the inevitable question: Since it is proved that reason is not infallible, and reasonings do differ, how can one distinguish between right and wrong and find one's bearing in this wide world?

Sir Syed tackled this problem with characteristic boldness and optimism — and faith in human reason. He wrote:

"Then I considered how to guarantee against mistakes being committed by reason. I admit that in reality there cannot be any guarantee against this. But when reason is applied in practice, then the mistake of the reason of one person is corrected by the reason of another, the mistake of the reason of one age is corrected by the reason of another age. But when knowledge, conviction or faith is not based on reason, then it is impossible to arrive at them in any age or period."[19]

It will, perhaps, be difficult to find in the whole of Muslim philosophical literature anything comparable to this.

Sir Syed had little direct knowledge of the latest trends in European philosophy of his time. It is, therefore, remarkable that he evolved a theory of cognition which, notwithstanding the many contradictions in his ideas, can be rightly considered among the most advanced for his times in India. With him reason is no more contemplative and abstract, but arises out of and is applied in practice, it is not the reason of one individual but the collective wisdom of society as a whole correcting each other's mistakes, not the reason of one age but the reason and wisdom of each age being corrected in the evolutionary process by the reason of the following generations. It is this concrete, collective and evolutionary concept of cognition and reason which Sir Syed puts forward as the sole guide for man in his long journey through his universe. Man's knowledge goes on ever increasing, and with this his practice improves and his control over nature expands and consolidates.

This bold venture in the realm of thought was bound to shake the foundations of all traditional faith. Because inherent in this concept of the ever-expanding contours of man's knowledge of and control over nature was another and a more basic concept — the concept of the immutability of the laws of nature. Sir Syed was a religious man. But his understanding of religion was objective. Defining nature as the work of God, Sir Syed believed that nature had an objective existence with its own regularities and laws which do not change. But if this be so, then what remains of the powers and functions of God? Here the traditional ideas about God were subjected by Sir Syed to serious modifications. This evoked protests even from some of his closest colleagues. Mohsin-ul-Mulk wrote: "The way you treat the (question of the) qualities of God...can only mean that God is a useless being and to ascribe will and power to him...is meaningless."[20] For if the laws of nature will take their own course and even God cannot do anything to change them, then prayer and application are also useless in so far as this cannot bring about any change in the conditions of man. Mohsin-ul-Mulk wrote that "to deny the efficacy of prayer in the achievement of material objectives is in practice heresy"[21]

Sir Syed's reply is interesting. He wrote: "God is omnipotent.... And if by virtue of being all-powerful he sent the hypocrites and the infidels into heaven and the Muslims into hell — then what will you do?"[22]

These discussions couched in theological terms were no exercises in abstract and abstruse scholastics. They had serious practical implications. By denying the role of prayer and supplication in mundane affairs, Sir Syed was, in fact, establishing the primacy of human action, man's conscious effort to improve his lot.

Moreover, some of these arguments had a logic of their own whose momentum carried them to positions perhaps not imagined earlier. If the *Quran* and Islam are in complete accord with nature and its laws, then, argued Sir Syed, every human being, irrespective of his attitude to religion, is a Muslim inasmuch as he can thrive and live a meaningful life only by observing these laws. But, concedes Sir Syed, a distinction has to be made between a Muslim and a Mohammadan.[23] While conscious religious beliefs, thus, come to be of little relevance in the struggle for material, social progress, Mohammadanism — faith in the prophethood of Hazrat Mohammad — is not held to be a necessary condition for salvation even in the world hereafter.[24]

It will be no exaggeration to say that these ideas of Sir Syed provided a basis for inter-denominational unity and a secular society in India. Sir Syed's vehement opposition to pan-Islamism is well known.

◆

Sir Syed Ahmad Khan was under strong pressure to recant his views publicly in the interest of the Anglo-Mohammadan Oriental College. He refused. Nevertheless he had to agree to close down the *Tahzeebul Akhlaque*, the powerful organ of freedom of opinion and free quest of ideas. He also had to promise to do everything so that his views on religion did not find their way into the AMO College[25]. He paid this price for the sake of this educational institution. In the end he found to his dismay that this institution was very far from what he had intended it to be.[26]

During his last days there came a final parting of ways between him and almost all his closest associates. Apparently the issue was a minor one — the election of his son Syed Mahmud as his successor. But for this issue to blow up into a major crisis could only have been due to the accumulated differences of a lifetime. A document denouncing him was signed by almost all his colleagues and sent to the press. If it did not see the light of day it was only due to the sudden death of Sir Syed. He died an unhappy man.

What went wrong with Sir Syed Ahmad Khan?

Various explanations have been put forward for this development. But the more important and significant cause from the point of view of both immediate and long-range consequences was the inner contradiction in which Sir Syed himself was involved. His ideas of freedom of opinion and expression, of rationalist interpretation of Islam, and his efforts in the cause of liberal education could not thrive on the basis of the old decadent aristocracy. Sir Syed was not only unable to make a break with this class but, in course of time, became more and more dependent on it. He based his movement of reform and education on the support of the Muslim aristocracy. His educational efforts, in the main, were aimed at spreading education among the aristocratic classes. Dr Syed Abid Husain has remarked that "Aligarh became the mirror of the desires and aspirations of that class of Muslims with whose help Sir Syed set up the AMO College and which controlled the Board of Trustees .... The college had almost nothing to do with the other aspects of Sir Syed's reform movement".

This was, perhaps, inevitable because of the anti-democratic sympathies of Sir Syed. He opposed the demand for holding the Indian Civil Service competitive examinations in India because members of the so-called inferior classes (even from among Muslims) would get an opportunity of joining the Indian bureaucracy and ruling over the members of the superior classes. It is wrong to say that Sir Syed's opposition to democracy arose because of his fear of the numerical superiority of Hindus. It was his concern to preserve the privileges of the Muslim aristocracy which made him oppose democracy within the Muslim community.

Rationalism and freedom of thought and expression cannot go together with opposition to democracy. Sir Syed and together with him the Muslims of this sub-continent had to pay the price of this contradiction which Sir Syed could not overcome. Even almost four decades after Independence and partition, the Muslims of India and Pakistan are still suffering from its consequences.

Today the situation is certainly very different from what it was during Sir Syed's time. Large sections of toiling Muslims — from among the peasantry, the artisans and the industrial working class, as well as the intelligentsia — constitute an organic part of the democratic movement.

A major task and challenge facing them is to carry forward the rationalist tradition of Sir Syed Ahmad Khan while, at the same time, overcoming his contradictions and class limitations.

Regan and Third World (*from page 5*)

can be used as a quid pro quo is being emphasised. America's friends — Chile, Argentina, El Salvador, Turkey, Pakistan, Morocco, Egypt and Israel — get large doses of military aid: others who will not join the US in "standing up" to the Soviets must learn to do without US aid.

More worrying for the Third World than this is the explicit American attempt to bring both the World Bank and IMF "closer in line with the administration's philosophy, on worldwide lending". A Treasury Department paper wanted borrowing countries to take more stringent measures to "streamline" their economies as a condition for receiving loans. Specifically, the multilateral institutions should require "among other measures that borrowers eliminate government price subsidies, ease import restrictions and cut the size of the public sector." Any loan not in line with the new tenets would be opposed tooth and nail by the United States. The threat does carry weight, because with its voting strength of 20 per cent in the IMF and World Bank the US can virtually veto all decisions at the Executive Board level of these institutions. The Treasury Department paper also included the demand that the institutions move away from soft loans and phase out better-off developing countries from the roster of those qualifying for special low-interest lending. It also advocated cutting back US financial obligations to the World Bank and other multilateral lending organisations and reducing US commitment to the IDA. Current World Bank and IMF policies reflect these recommendations; in pursuance of its budget cuts the US has stretched its contribution to the IDA.

American efforts to rid multilateral financial institutions of any "socialist tendencies" and to use them as vehicles for the propagation of its ideological preferences will profoundly affect developing countries who are the major borrowers from these institutions. And given America's growing neoconservatism, developing countries are likely to face an uphill task in what Helmut Schmidt called the struggle for "the world product".

It may be true, as a Rand study report says, that "nations like individuals do not divest themselves voluntarily of their accumulated wealth." But then, nations like individuals cannot reconcile themselves to a state of perpetual poverty either. The Third World struggle for a large share of the global cake will continue, as will its struggle to attain greater autonomy culturally, economically and politically from the great powers.

It is the wooden American policy again, of preserving the status quo, that brings it into clash with the Third World vis-a-vis South Africa. Here America's traditional postwar reluctance to support the forces struggling for decolonisation has been compounded by South Africa's strategic significance — its geographical position astride the Cape Sea route, its rich mineral resources and the heavy western investment there.

The racist regime in Pretoria could not have a better friend than Reagan. The spectre of an apartheid-induced political conflagration in South Africa did force earlier American administrations to nudge Pretoria towards accommodating, in some measure, the aspirations of its nonwhite citizens for political participation and equal status. Not Reagan however, who would not like America to abandon a country that has "stood by us in every war we have fought" and a "country that strategically is essential to the free world". High-level contacts between Pretoria and Washington have been resumed and economic sanctions against the former withdrawn.

The Reagan Administration's stand on Namibia's independence is unprecedented. Before the question can be considered, it says, the Cuban troops in Angola must be withdrawn. At the same time, the US administration encourages intervention by South African troops in Angola and supports the Unita guerrillas who are battling the Angolan government.

After the breakdown of the Geneva Conference on Namibia the UN General Assembly, in March 1981, called on the Security Council to urgently impose mandatory sanctions against South Africa with a view to ensuring compliance with UN decisions and resolutions relating to Namibia. When the UN Security Council met on April 30, the three western powers — the USA, France and UK — vetoed all the four draft resolutions which had received clear majority support. Mrs Kirkpatrick, the US delegate, argued that sanctions did not solve problems. And this at a time when the USA had embargoed grain trade and banned export of sophisticated technology to the Soviet Union and Iran.

Later, on August 31, 1981, the USA was isolated in the Security Council on the issue of the South African invasion of Angola. France voted for the resolution tabled by the non-aligned members of the Council condemning the South African action while Britain abstained. The US delegate conceded that South Africa's intransigence over Namibia was the cause of instability and tension in the region but also blamed the presence of Cuban troops and Soviet advisers in Angola and the alleged supply of arms to Swapo guerrillas.

The US Administration's policy on Angola, Namibia and South Africa has been criticised by influential Americans. A Rockefeller Foundation study for example, has concluded that changes in southern Africa are inevitable and has suggested adjustments in US policy. A failure to do so may grievously affect American interests in the long run and provide another target of opportunity to the Soviet Union, as in Angola.

US attitude on West Asia and Palestinian autonomy has displayed the same disregard of international opinion. Despite the UN resolutions seeking a solution of the West Asian problem on the basis of the right to self-determination and autonomy of the Palestinians, Americans have shown no inclination to extend the framework of the Camp David agreement or to restrain Israel. On the contrary Reagan's stress on evolving a strategic consensus to contain the Soviet Union and the agreement on strategic cooperation with the Begin Government, have enabled Israel to flout international laws with growing impunity. The confrontation with Syria in Lebanon, the bombing of the Iraqi nuclear reactor at Osirak and the Israeli annexation of the Golan Heights have met with little more than proforma protests by the United States and even these have been necessitated more by the US desire to avoid offending the oil-rich Arab states than by any annoyance with Israeli actions. Thus the US response in the UN to the Israeli raid on the Iraqi reactor was essentially an exercise in damage limitation. While supporting Iraq's resolution (which was moderated by the Iraqis to satisfy the US) condemning Israel, Jeane Kirkpatrick recalled "the strength of the US commitment to Israel and the warmth of our feelings". Reagan, in a press conference prior to the UN vote, went even further in providing an alibi: "Israel", he said, "might sincerely have believed it was a defensive move." On the annexation of the Golan Heights not only did the Americans veto, in the Security Council, a resolution calling for mandatory sanctions against Israel, but also lobbied openly to block support for a General Assembly resolution tabled by 56 nonaligned countries. The resolution, which was adopted by the General Assembly on February 5, 1982, called on all member-states to stop arms sales to Israel, suspend aid and sever all ties. It strongly deplored the negative vote by the US in the Security Council which had prevented appropriate action being taken against Israel.

The problem of peace in West Asia today stems, in point of fact, much more from Israeli intransigence and its perceived need to ensure absolute military superiority over its neighbours than from any Soviet designs. Any durable peace in West Asia would, therefore, have to be based on autonomy for the Palestinians and the return of occupied territory in return for Arab recognition of Israel. This is, in fact, the burden of Saudi Arabia's eight-point proposal.

THE problems that America today faces in interacting with international organisations, its sense of being under siege, stem essentially, as we have seen, from its inability to reconcile itself to the gradual erosion of its hegemony in the world system. These problems are likely to become more acute if the US seeks, as it does under Reagan, to hark back nostalgically to the postwar style of US leadership.

The world is far too complex for any one country or group of countries to impose 'order' and America must reconcile itself to a cooperative approach to global problems if mankind is to survive.□

CHINA REPORT

A bi-monthly journal for the study of contemporary China and related Asian affairs. Published by the Centre for the Study of Developing Societies, Delhi. Promotes empirical and theoretical studies of China's policies and behaviour. Also aims to develop an inter-disciplinary basis for analysing the Indian and Chinese societies. Now in the eighteenth year of publication.

COMMUNICATION

Railway Finance

THE review made by P.N.S. Bedi on the Railway Budget 1982-83 (*Mainstream*, March 13, 1982) and the debate on the same in Parliament is by far the best one has come across. Bedi has shown that improvement of productivity in railways is more urgent than increased investment, which "are needed more for education, health, housing and supply of clean drinking water, for example".

There was a time when modern management and costing techniques were not in vogue in this country. Yet all along the railways were compiling for managerial use a series of inter-related indices, in physical terms, on operating performance vis-a-vis utilisation of assets, both at zonal and apex level, periodically. These indices clearly showed the areas of malfunction and level of deterioration. Nothing was left out of reckoning. Even the state of affairs regarding repair and maintenance as well as use of track and rolling stock used to be focussed. Hence there was lesser call for investment in railways. What is therefore needed is better utilisation of the existing assets by way of "enthusing" railwaymen to "higher productivity", which however does not come on asking. Productivity is the product and index of quality in management. The discipline also is.

Bedi has however left from his analysis one vital point, also raised in Parliament. Should the railways go on its own, to raise institutional funds or for market borrowings? This leads to another question — should railways remain as a department of the Government of India or be converted into a corporation in the public sector? Both the questions are also being examined by the Railway Reforms Committee. For answer it is to be noted that the railways is essentially a functional apparatus of the government to help implementing its socio-economic policies and programme. In that respect the railways is an integrated part of infra-structure of economy and development Hence railways should remain a department of the Central Government; only this status allows the scope for rationalisation of the role and function of railways consistent with national goal and exigencies. Finding funds for investment in railways is again linked with the government's overall economic and fiscal policies which do not admit of any duality in approach.

pride. Even as an elite institution for high-level research it has produced nothing new even for the elite. How many drugs have been invented? How many groundbreaking diagnostic tools? How many vaccines, prophylactics and pharmaceuticals? How many new implants, surgical procedures and treatment methods? The answer is: hardly any.

This is not to say that there are no excellent physicians and surgeons at the AIIMS. Obviously there are some. We would be in deep trouble if there weren't. But they have to survive by working 'quietly' or by being loyal members of one clique or another. No, the AIIMS can't be let off the hook because there is no basic health care in India. The AIIMS must do some *original* work, whether for the poor or for the rich. At least for a start, it could get rid of the cockroaches.

(Dr) Piloo Khory

New Delhi

CIA Forgery *(Contd. from 8)*

on the Vietnam fighting, captioned "Aggression from the North." An account of a suspicious cargo vessel moored in shallow waters which was sunk by Vietnamese forces was also accorded space in the White Paper. This vessel carried arms of Communist origin and newsmen were allowed to visit the site and view the cargo. This happened on February 16, 1965. It was the publication of this White Paper which mobilised US public opinion on direct commitment of American forces in the war.

What did the Americans gain from the Vietnam war? While Vietnam became a testing ground for new American weapons the Vietnamese underwent untold misery, a misery that has no parallel in the second half of the twentieth century. With Reagan determined to show his might somewhere and with events in El-Salvador coming his way, it will not come as a surprise if we hear more of Vietnam type exploits down there by the Reagan Administration in the near future.

Rather interesting is the report that Liechty was forced to speak out because he fears that watching the present goings-on in El Salvador the CIA might prepare something similar for an American intervention in that country.

Manjulika Dubey Replies

MY intention was not to "let the AIIMS and its doctors off the hook" but to point out that the phenomenon of "medical politics" was an inevitable by-product of our system of health care. Dr Khory's remarks only strengthen my contention. The point he makes about the poverty of original research in the Institute is a valid one. But I should like to ask: if the protesters are so firm in their conviction that dirty work is afoot, why do they sign public statements defending their superiors and put up private posters attacking them? Doesn't that kind of morale cowardice perpetuate the system he criticises? □

Drift-wood Politics

CHARAN SINGH'S "retirement" from active politics announced with almost sonic bang has ended in a miserable whimper in exactly nine days. But the Lok Dal's old man of the sea is not the only politician who is engaged in enacting a farce.

The three-in-one unity convention due to take place in Chandigarh about the time these lines are to go in print, can hardly be a morale-booster for the Opposition. The utmost it may hope to achieve is to avert the splitting of votes among the three — the Biju-Devilal rump of Lok Dal, the Congress-S and the Janata — which is not expected to make any material difference to the outcome of the poll announced in the four States of Himachal, Haryana, Kerala and West Bengal. Far from achieving even an alliance of the three parties, it will not even bring about electoral understanding among the three: the Janata has already announced that it will go it alone in Kerala and West Bengal. Even in Haryana, this combine has little chance of wresting the majority from the Congress-I which is now reinforced by the appearance of a very active Bansilal.

The fact that BJP is left out of this Opposition combine means that triangular contests are inevitable in most of the constituencies in Haryana and Himachal and this is likely to help the ruling Congress-I. There are even reports of Charan Singh and Jagjivan Ram striking a deal with BJP — a prospect which may not be adverse for the fortunes of the Congress-I.

In the Left-dominated West Bengal and Kerala, marginal shifts may make a big difference; this will be particularly true in

Kerala and not so much in West Bengal. In fact, the mini-parties with their shifting loyalties may be holding the balance in Kerala, where a new element this time will be BJP, thanks to the growth of RSS in rebound to the CPI-M sectarianism. In West Bengal, while the Left Front is assured of a majority, the margin of its victory is likely to be thinner this time compared to 1977.

This kaleidoscope of Opposition fragmentation coupled with occasional attempts at unity, holds out no possibility of Indira Gandhi's party suffering a reverse in the electoral tally — even if Bahuguna manages to win the Garhwal fresh poll — as compared to that of her adversaries. The Left leaders would be making a grievous mistake if they came to the hasty conclusion that the Congress-I is cracking up or fading out. The creeping inertia in governance, the Antulay affair, the skeletons in the Bhosale cupboard, the Maneka episode with its mother-in-law-daughter-in-law dimensions — all these are grains of sand which do not yet make a mountain. No doubt these do not enhance Indira Gandhi's standing, but as yet there is no sign of her party having suffered sufficient erosion to think of a change in the balance of forces.

The international environment — particularly the developments in the region — does not in the least undermine Indira Gandhi's position at home. Rather the urgency of strengthening the country's security can only help her standing since she has never been afflicted with the Janata's appeasement propensities. This does not however mean that in the event of an actual conflict, Indira Gandhi can expect to reap the political harvest in the manner she did after the victory in the 1971 Indo-Pak war. Certainly the internal situation today is more complex and the morale less sustaining than these were ten years ago, but there is no room for Opposition hopes of a collapse of the Indira Raj. The Opposition, particularly the Left, has to guard against self-deception which passes off wishful thinking for objective appraisal.

Equally will Indira Gandhi be making the mistake of being complacent. Over the years, one has often noticed that she is in the habit of alternating between self-complacence and a sense of insecurity. Both take heavy tolls in terms of policy moves and performance record of her Government. The complacence born out of the electoral victories of 1971-72 led to drift in the next two years, followed by a sense of insecurity over the unrest in Gujarat and Bihar leading to Emergency and its excesses. If anything, Emergency was the product of panic in the Indira establishment, not certainly a demonstration of its strength nor of its sure mastery over the situation.

Viewed in this context, the present drift in our political life may give rise to complacence on the part of Indira Gandhi at the Opposition's imbecility, which may accelerate the process of drift followed by discontent — a scenario which in turn may lead to panic on the part of the ruling establishment. The Opposition prognosis that Indira Gandhi might in such a situation go in for something drastic such as imposing a presidential system of government or clamping down Emergency is not based on any dispassionate assessment of the existing trends and of the overall situation. While there is little to doubt Indira Gandhi's dreams of playing a De Gaullist role in the Indian context, there is no indication of Indira Gandhi planning a drastic overhauling of the present system which may only help her opponents to close their ranks to fight her. As for the possibility of re-imposition of Emergency, one can only venture to suggest that History does not really repeat itself; if anything, Indira Gandhi must have learnt that her Emergency misadventure was responsible, to a large measure, for her poll debacle in 1977.

It is futile at this stage to speculate about what Indira Gandhi might be doing tomorrow or the day after, as it will be to expect the Opposition to overcome its chronic bankruptcy. It may be a truism to say that things will get worse before they are better, but this seems to be the only truth warranted by the present drift in Indian politics.

COMMENTARY

Tinsel Politics in Telugu Land

A celluloid avatar turned at an advanced age into a real-life political avatar is novelty enough to keep the gossip mill well fed in Andhra Pradesh and outside. N.T. Rama Rao, with the rounded figure and Cheshire-cat grin associated for some obscure reason with most of Hindu divine incarnations, is said by some enthusiasts to be looked upon by the illiterate poor as a genuine avatar descended from the screen to save them in this life or their souls in the next. Others have a higher opinion of the discernment of the electorate.

A cinema star attracting crowds is common enough; but the crowds have a tendency of acting as heady liquor in the case of the ambitious and the vainglorious. Those two words would seem to sit well on Rama Rao who is mentally inadequately equipped to see that he is being used. No doubt he sees himself as the future Chief Minister *a la* M.G. Ramachandran of Tamilnadu. The difference is that MGR had been in active politics for well over two decades before he thought of Chief Ministership. He was one of the chief architects of the pre-split DMK, enjoying the confidence of its leader Annadurai by whom everybody now swears in that neighbouring State. MGR worked among the poor in many parts of the State, offering generous relief out of his earnings, apart from providing funds and a sizeable following for the party. Rama Rao has no such record, though his earnings too have been substantial over long years. That he has "jumped into the fray" as he is about to turn sixty is not without its point.

Of course the Congress-I is in a mess in Andhra Pradesh. The style of functioning of the central leadership has only left a lengthening line of disgruntled elements. N. Bhaskara Rao, a "Congressman" of four years standing turned defector because of frustrated ambitions, is considered the brain behind NTR. His plan seems to be to spread the net wide and get as many defectors as possible. That some have walked over should not be seen as the last or even penultimate scene in this multi-dimensional real-life screenplay with a heavily made-up tinsel-god as the centre-piece. Already there are signs that the play is not proceeding according to Bhaskara Rao's script which is said to have the blessings of some leading lights of the infighting in the Andhra Pradesh Congress-I. Anjiah was freely mentioned, not without reason; but he swears loyalty to Indira Gandhi and claims that his controversial Panchayati Raj Forum, newly floated, is no political platform but an instrument to consolidate Congress-I gains and improve on them. In politics one takes every utterance with a large dose of salt, but for the moment Anjiah may be expected to lie low or seek redressal for the humiliation to which he was subjected. Even Chenna Reddy, the undimmed nodal point of political controversy in Andhra Pradesh, was mentioned, but he has accepted a governorship, this time in Punjab, though he is noted for long-distance operations even if not for remote control. And there are others, including Brahmananda Reddy.

The Congress-I has neither organisation nor cadres nor discipline — something that is true not only of Andhra Pradesh. This situation is certainly a great help to the likes of Rama Rao and his mentor Bhaskara Rao. If Indira Gandhi, increasingly surrounded by topless advisers, imposes nonentities as Chief Ministers in States (even if, as in Maharashtra, to replace arrogant and unscrupulous upstarts), she and her colleagues in what passes for the central leadership must pay the price. They are paying it. Caste, regional and factional quarrels were never absent either in Andhra Pradesh or in some of the other States. Every senior leader has a background, often unsavoury, and this plus the presence of hostile groups makes the choice difficult, certainly. So the supreme leader resorts to nomination; and that leads straightaway to resentment and intensification of faction war based on caste, region or merely personalities. Politics becomes lively at least for the media if not for Indira Gandhi and her coterie at the top. Instability in many of the Congress-I States has inevitably become the rule, and this is what throws up Rama Raos and in another sense Akbar Ahmeds. And Venkatrams and Bhosales are no answer; they are perhaps new questions.

"Telugu Desam" (Telugu country) is rather an odd name for a political party; it doesn't even sound like a good film title. Nor does it offer the advantage of sounding impressive when abbreviated, as in the case of the DMK and ADMK. In any case the name does not reflect anything, least of all the reality of politics in Andhra Pradesh, where the Reddy-Kamma conflict has long been part of life, with each of these castes seeking to assert its supremacy. The other upper-caste groups have always resented the domination of these two caste groups, but have taken sides as convenient, while the lower castes with their miserable conditions have remained unaffected, except perhaps adversely in some areas. Thus the derisive description of the Bhaskara Rao-Rama Rao brainchild as "Kamma Desam" should cause little surprise. The chances are that before long Rama Rao will be left holding a Kamma baby, with other caste leaders moving away, and possibly the shrewder among Kamma leaders now looking benignly upon him will also have second thoughts. NTR fans are spread over all castes; but the way his political adventure is shaping, he cannot count on the majority of them, in contrast to MGR who could and does bank on their unwavering support. Whether he is proving to be a good administrator is a different question; but on that score NTR's promise is far dimmer.

Apart from the fact that like other new or splinter parties Rama Rao's set-up is also raising well-worn slogans and indulging in discredited shibboleths, his initial forays into political tub-thumping have shown him to be devoid of both historical and political sense — and of common sense as well. His vituperation against the ruling Congress-I, its inept administration, frequent ministerial visits to Delhi and so on, at first sight seems justified. The Congress-I ministers and even legislators do invite such criticism by their conduct; and the operational style of the central leadership adds weight to such criticism. But can it be overlooked that it is precisely from that same ruling party that NTR and his "Telugu Desam" seek to organise defections to strengthen themselves? It was when a whisper campaign began about his calculations vis-a-vis Indira Gandhi that he has come out with criticism of the Prime Minister. Andhra Pradesh Congress-I men have reacted angrily to the attack on their beloved leader. But from the press reports one hardly gets the impression that NTR was making any worthwhile point against her. His targets are within the State; his ambitions are also limited to the State. Some would substitute "his caste" for those last two words in the previous sentence.

One does not know if it is only ignorance that led to the vicious attack on that giant freedom fighter, T. Prakasam, who will not be judged by his brief and ineffective spells as administrator. Sanjiva Reddy has been an active politician for years and the attack on him will be seen as part of an attempt to whip up casteist chauvinism. The reference to Madras City and to the utilisation of Krishna waters is perhaps meant to rouse secessionist, or at least sectarian, feelings. It is doubtful if all these stunts will help the film star and the wire-pullers behind him; he will no doubt find his level before long, even if he and those who find his money useful will make much noise prior to the elections. Politics is in bad enough shape already, without having to be pulled down to the Bhaskara Rao-NTR level.

Rama Rao's party would have been dismissed as a passing freak but for the rumblings in the Andhra Pradesh Congress-I. Till now the other parties have not even reacted to what is projected as something of a phenomenon (no one has yet said however that the NTR party is a direct result of the recent planetary conjunction). It is the Congress-I with its changing personalities and vote bases that is somewhat worried. The party's central leadership is yet to learn the obvious — that it is not enough to change the face in the Chief Minister's office or to convert ministerial berths into musical chairs or to appease different groups at different times hoping that ultimately permutation or combination will turn out to be just right. Politics cannot be managed that way; nor can effective administration be ensured. To organise the choice of their leader by the legislators themselves, to prevent abject dependence on the central leadership or more precisely on one leader for survival in office, to help tone up the administration, to establish rapport between the ministerial and organisational wings, and to help build cadres and an organisational apparatus that will function as the people's watchdog — these are the tasks for the central leadership, and these precisely have been systematically neglected.

What is really regrettable in the Andhra Pradesh situation is not the glamorous entry of a film star into politics with a party of his own; in the nature of politics it cannot last long. The matter for regret is that the Left, democratic and secular parties and forces have shown lack of readiness to utilise the situation to further popular causes and interests or to mobilise a new popular alternative.

Rama Raos may come and go, but the warning implicit in the development needs to be heeded.

April 13

Punjab : Changing Contours

DAMPENING hopes aroused by the earlier round of talks between the Prime Minister and the Akali leaders belonging to the Badal-Longowal group — undoubtedly the major one of the two rival Akali Dals — their last round of negotiations in New Delhi have been completely fruitless. Those who had been expecting that some sort of realignment might emerge in Punjab, with the Congress-I and the dominant Akali group entering into some kind of entente, have now perforce to revise their thinking.

The Akali version is that the Prime Minister did not sustain even the assurances she had earlier extended with regard to several of their demands, such as the merger of Chandigarh with Punjab and live relay of *Shabad Kirtan* from the Golden Temple in Amritsar. As for the Prime Minister's award on the Ravi-Beas waters dispute, the former Chief Minister, Parkash Singh Badal, has expressed total rejection by the Akali Dal of the water-sharing formula as between Punjab, Haryana and Rajasthan.

Thus, the outlook has undergone complete change. Instead of an accord, the Akali Dal-L and Congress-I have found even the meagre common ground that was emerging in their relations, to be disappearing. In fact, the Akali Dal-L has launched a fierce (though non-violent) struggle, which they have been describing as an all-out 'war'. Mercifully, it is not a 'dharam yudh' this time but an economic form of struggle, in which the CPI-M has also lent a hand.

The change in the Punjab scene is being ascribed to several visible as well as subterranean factors. The Akali leaders themselves have attributed the Prime Minister's altered stance to the imminence of the elections in some States, including Haryana. Thus, this consideration will certainly apply to the demand for immediate merger of Chandigarh with Punjab. Equally, the demand for altering the award on the sharing of Ravi-Beas link waters and giving a larger share to Punjab can be considered impracticable, and all the more so because of the Haryana elections due next month.

But it would be unreasonable to take the view that the Prime Minister has to accept all Akali demands without question: such, for instance, is the case about live broadcasts from the Golden Temple of *Shabad Kirtan*, since acceptance has been given of such a broadcast on some outstanding occasions, while taped *Shabad Kirtan* is being broadcast at regular intervals. The same can be said about several other Akali demands that have already been accepted in substance. Among them is the demand, already fulfilled, for making Amritsar an international airport.

However, it would be fair to ascribe the new tenor of the Akali-PM talks to the altered situation in Punjab. One of the factors, even if not the most important, now in operation is the backdrop of the Congress-I factions and alignments. The point to be noted is that there is a discernible shift in favour of Chief Minister Darbara Singh, while the stock of Giani Zail Singh has slumped. It was the Giani who was arduously working for a Congress-I-Akali line-up, with himself at the helm. On the other hand, Darbara Singh has been far from enthusiastic about the linkage. The Punjab Chief Minister is among the group of staunch Punjab nationalists who have always stuck to the view that in Punjab; the main political rivals that the Congress has to face are the Akalis, in the first place, and the RSS in the second place. The rift in the Akali Dal has no doubt altered the situation to some extent. But which of the two Akali factions can be of greater value in terms of a tacit understanding vis-a-vis the Congress-I — on this opinions differ.

There is another sizeable change in the set-up in Punjab. Darbara Singh's men claim that the Chief Minister's staunch policies have led to isolation of the extremists propped from abroad, with the result that one hardly hears talk of 'Khalistan' even from extremist platforms. The Akali Dal-T's gathering in Anandpur Sahib is a case in point. "The World Sikh Convention" which the Dal sponsored there has been a tame show. Apart from the poor response it evoked — and the attendance at this so-called international gathering was not even a shadow compared to the massive gathering addressed by the Prime Minister not far away while inaugurating the Ravi-Beas link canal early this week — the speeches too lacked the earlier fire associated with the sponsors of the Sikh-a-nation theory.

Significantly, the expulsion of Ganga Singh Dhillon at Delhi airport itself, just as he landed from Washington with a well-prepared address for the convention, hardly aroused the type of protests that were expected. Dhillon's address read out on his behalf, as well as other major speeches, were on a low key. The secessionist overtones were being slashed and the character of State autonomy and Punjab-and-Punjabis was now being carefully played down.

While these developments have set the tone for a cooling of ardour of the extremist groups, the major Akali Dal-L is now gradually reorienting itself to demands which are being projected not only as Sikh demands but as those of all Punjabis. This will be seen as a welcome development, though the logic of power struggle introduces many a distortion into what might be a struggle for economic demands of the Punjab peasantry. The fact that the cotton price crash provides a distressing backdrop to these developments has not been widely noticed. But it does provide a major point for garnering peasant support by the Akali Dal under Badal's leadership, more so since Chief Minister Darbara Singh props up his image as a "Jat leader," basing himself on the Punjab peasant.

Badal and his colleague, Barnala, have not forgotten their days in office when they found their solid peasant votes slipping in the last Assembly polls, which coincided with an earlier cotton price crash. "*Uppar Jat, Heithan Jat, Narman Wikya Do Sow Sath*" (Jat on top, Jat below, but cotton crashed to Rs 260) — this is the chant which swamped the Badal ministry then. Cannot the scene be repeated? Surely, Badal and Barnala are asking this question now, while launching the struggle for more Ravi-Beas link waters.

To this must be added the behind-the-scenes activities of Giani Zail Singh, who rushed to meet Sant Jarnail Singh Bhindranwale in the Capital, movingly seeking his blessings while touching his feet.

FOCUS

Crafts and Cant

MANJULIKA DUBEY

WHAT factor could there be in common between the mammoth eight-month-long Festival launched in London last month by the Government of India at an estimated cost of ten million rupees and a modest four-day exhibition of assorted handicrafts organised in Delhi by a voluntary action group of five women at a cost of Rs 17,000? The answer, incredible as it may seem, is: the bottom line, in terms of net financial benefit to the craftspersons whose products in both instances was offered for sale. The *Dastkar* exhibition fetched the craftsmen and women an average of Rs 20,000 on each of the first two days, and the figure sagged slightly thereafter only because there was not enough stock to meet the demand. The balance-sheet of man-hours and money spent against profits made compares more than favourably with Selfridge's reported average daily intake of Rs 50,000 — which, when offset by substantial overheads and commissions, will easily whittle down profits to less than what five determined women have accomplished.

It will, of course, be argued that the impact of the Festival is not commensurate with that of a crafts-oriented body like *Dastkar*, that the spillover effects of the London extravaganza are of much wider significance, and that comparisons of this kind are inadmissible or picayune. Everybody enjoys a good *tamasha* and, after all, haven't handicrafts exports gone up as a result of promotional exercises of this kind in the affluent West? It's only a handful peevish killjoys who are trying to dim that comfortable glow of satisfaction ensuing upon the inaugural flourish by asking questions about cost-benefit analysis and other such niggling matters.

The debut of *Dastkar* and the Festival have many more implications for the country's future than are evident at first glance. The special place that handicrafts occupy in the life and psyche of the country was given symbolic weight with the spinning wheel as the motif during the feedom movement. Adrift as we are today on the cross-currents of old and new, East and West, the crafts in which the soul of India spoke through wood and stone, clay and metal, can signify either a lifeless talisman to parade and flaunt or a seedbed to restore us to an organic and harmonious connection between the land and its people.

The touchstone is the artisan, the craftsman himself. If he is able to work, if he can continue to make what he has been trained to produce with care and concentration over generations — whether it is to weave a grass mat or cut and polish a diamond — secure in the knowledge that his labour will be recognised and rewarded, then we can say with pride that we are doing something about restoring a heritage threatened by the mushroom cloud of plastic and terylene. If the craftsman is not respected and supported thus, our activities amount to just so much chatter, self-delusion and tokenism: Marie Antoinettee playing at dairymaids.

And this is where the juxtaposition between the grandiose Festival and the unpretentious *Dastkar* exhibition becomes significant.

What are the compulsions that give birth to organisations like *Dastkar*, when for thirty years we have seen agencies proliferate and crores spent ostensibly to secure the livelihood of our 19 lakh craftsmen? Are there any data on the number of artisans employed in the various branches of handicraft production? Nothing but what can be culled from census reports. Any study of the impact of Government policies and programmes on, let us say, the middlemen whom they are supposedly geared to eliminate? None. Any feedback on how effectively all those crores have been spent? Again, only in the case of exports, where foreign exchange figures are available elsewhere. The last report of the All-India Handicrafts Board appeared in 1979, and after this confection of moonbeams and cobwebs was torn to shreds by the Public Accounts Committee the Board has maintained tactful silence on the subject of its annual activities. Where are the 218 rural marketing centres that were said to have been set up? All defunct. How fast are decisions taken and implemented? Make a guess. How often do the policy-makers — or, for that matter, the functionaries who deal directly with the artisans — venture from their airconditioned warrens into the heat and dust where the potters and weavers, leather and glass workers sweat and struggle for a bare existence? Guess again.

This is not to say that nothing at all has been achieved in these thirty years. In the Central Cottage Industries, Corporation, the energy and will of a single person has in a few years cut down the quantum of business through middlemen from 90 per cent to 40 per cent and as long as the craftsman continues to be plagued at every stage between securing an order and receiving his final payment, alternatives like *Dastkar* will be necessary to fill the vacuum.

Crafts have their roots in a community life that is now disintegrating rapidly, and attained their highest expression in a symbiotic nexus between privileged patron and artisan. The tradition can be revitalised only if those roots are conserved, not simply by reconstructing hothouses of patronage. The slow, meticulous and painstaking work of setting up systems and organisations that are governed by an enlightened perspective and in tune with the specific needs of the artisan is largely neglected — which is fundamentally, for markets and for access to credit and raw materials.

The successful four-day *Dastkar* exhibition was partly sponsored by the All-India Handi-crafts Board. These efforts to provide markets and retail outlets, improve techniques and ensure quality control, offer design and marketing expertise, arrange orders, loans, advances and raw materials, tap existing facilities and lobby for more, that will eventually coalesce into a real renascence of the crafts. Then, indeed, will we have cause to celebrate a Festival of India. (*April 13*)

Peace and Growth: Hanoi's Approach

Vietnam's Foreign Minister, Nguyen Co Thach, the substance of whose interview with a group of Indian journalists in Hanoi is given below, is visiting India on April 24.

Is the Kampuchean issue the main bottleneck in improvement of relations between the Indo-China states and the ASEAN countries? The Vietnamese Foreign Minister, Nguyen Co Thach, considers that this is not so. Not for the first time have Vietnamese forces gone to Kampuchea — they were there during the common struggle for freedom from French rule, then for ending Japanese occupation. Later, the Vietnamese and the Kampucheans fought together to free the country from American domination.

So, the Vietnamese Foreign Minister asks (in the course of an interview he gave to a group of visiting Indian correspondents in Hanoi at the time of External Affairs Minister Narasimha Rao's trip to Vietnam): What are the real causes of disagreement between ASEAN and Vietnam, or ASEAN and the Indo-China countries? Nguyen Co Thach draws upon history to underline the point he was making.

The talk that the presence of Vietnamese troops in Kampuchea 'threatens' Thailand does not cut much ice. In history, have the Vietnamese ever invaded Thailand? The reverse is true in relation to the Indo-China States, and in particular, Vietnam There has been trouble from Thailand on five occasions, during the last forty years. The first 'trouble' was in 1940: Thai troops had invaded Laos and Cambodia at the beginning of the Second World War. The second time, Thailand joined SEATO against the three Indo-China states in 1954 when they were struggling for independence. The third was in 1960-62, when troops were sent to intervene in Laos. The fourth time was in 1965-1973, when they joined the American army to fight against Indo-China states, and they also gave bases to the United States in Thailand to bomb Vietnam, Laos and Cambodia — "all this you know" and now, they have joined the Chinese against the Indo-China states. They cannot say there are Vietnamese troops in Thai territory. Never.

Thach went on: "And you see, when I met the Foreign Minister of Thailand, I told him that in history Vietnamese troops never settled on Thai territory, but the Thai army has been on Vietnamese soil three times. The Thai Foreign Minister told me, 'No, not three times. Two times only'." (laughter).

However, while reviewing relations between ASEAN and Vietnam, Thach felt there was no need for despondency: It is right that these relations are not good, but in comparison with the past they are better. In the past, from 1945 to say, 1975, they supported the French or the Americans against the Vietnamese and the other Indo-China states. Then it was war. But now it is not war. "At least we have diplomatic relations," he emphasised. Yes, there is improvement. In fact, from 1976 to 1978, the ASEAN countries were moving towards normalisation of relations with us, but at that time came China, with whom too the ASEAN countries wanted to normalise relations.

The Chinese leaders, in this period, came forward with the proposal of the ASEAN nations joining China in a front against Vietnam. Deng Xiao-ping visited the United States in January 1979 to prepare the invasion of Vietnam which came in February that year. That ASEAN went in the direction of China rather than support Vietnam is what led to the present situation in relation to ASEAN and the Indo-China states. So, the design of China has been to create a gulf between the ASEAN and the Indo-China states, and to see that the focus is not on China's aggressive designs towards the Indo-China states. That Thailand has shielded the Pol Pot remnant troops is part of this machination.

Thus, Vietnam's military presence in Kampuchea is linked to the threat from Thailand, from the Chinese. Once the Chinese threat is over, Vietnamese troops would be withdrawn completely.

"I can give you a date for our withdrawal — only one day after the Chinese threat is over", said Thach

Q: What would be the sign that the threat from China is over?

Thach: The evidence? We have experience with France and America: we can sign an agreement on the pattern of Geneva, for non-aggression. We have proposed a non-aggression treaty with China, and Laos too has proposed a similar treaty, so also Kampuchea. But China has refused.

Q: If China were to sign a non-aggression treaty with Vietnam, Laos and Kampuchea, you would accept that as evidence that the Chinese threat is over and that you can withdraw?

Thach: It is correct.

Turning to bilateral relations between India and Vietnam, the Vietnamese Foreign Minister indicated that Vietnam would soon be seeking India's cooperation in the development of agriculture, light industry, promotion of export goods, development of inland transport and the country's energy resources.

These also were the five priorities incorporated in the country's forthcoming five-year plan, and consequently his country could accept more assistance in these spheres of economic activity. This matter was discussed at length during the visit to Hanoi by India's External Affairs Minister, and would be continued when the Vietnamese Foreign Minister comes to India.

Thach believed that Vietnam could cooperate with India in the entire range of textile industry operations. Vietnam could also cooperate with India in building agricultural machines, in the mining industry, in coal, mica, bauxite, and so on.

How would Vietnam secure the financial resources for all the projects proposed, since India did not have enough financial resources, although it could extend technological aid and know-how, Thach was asked. There can be triangular cooperation, was his answer. Would it mean cooperation between India, Vietnam and COMECON? The Vietnamese Foreign Minister's reply was: "All other sources — third sources — we can get loans from, IMF, OPEC or COMECON, but it is not yet really clear. But we think that the third source of financing is very important".

Asked if it was a "very small loan" he was thinking about, Thach quipped: "It is very dangerous to have a big loan" (from IMF).

Falkland Flutter

PATRICK JONAS

APRIL is the cruellest of months said T.S. Eliot, and the Britishers found it true on April 2, for it was on this day that Argentine military forces took over British-controlled Falkland Islands down south in the Atlantic. Clearly it was not the loss of a few square miles of peat and grassland that hurt the British so much as the fact that it was left to a country like Argentina to remind them that they are no longer a power to be feared as in yesteryears.

Twentyfive miles across at its widest point and 250 miles to the nearest point on the South American continent, Falkland Islands supports a population of about 2000. For over 120 years Britain occupied and administered these 200-odd islands and Argentina has off and on voiced its claim to these islands on the basis of proximity (for 35 years during the 19th century claims were dropped but were later revived). Towards the end of 1977, Britain offered to transfer the archipelago to Argentina within 15 years provided a number of joint agreements were concluded for exploitation of natural resources. Talks on this have led to no agreement.

The initial feeling in Argentina after their takeover of the islands was one of joy— something akin to their winning the world cup football in 1978 — but this has gradually changed. People now wonder where this adventure of Argentine President Leopoldo Galtieri will take them. General Galtieri is well known at home and abroad for contempt of human rights. The nation runs an inflation rate of over 125 per cent, one of the highest in the world. This military move is believed by many Argentines to be a diversionary tactic, but the invasion of Falklands might well change the career of the Argentine President. After he took over as Commander-in-Chief of the Army in December 1979 he was responsible for closing the border with Chile in April 1981, thereby risking renewed conflict with that country — they were on the brink of war at the end of 1980. Later last year he offered Argentine troops for the Sinai control force; and to the Salvadoran junta he offered troops and equipment. Now, after his successful invasion, he is prepared to fight a full-scale war with Britain and if he wins, it will give a much-needed boost to his image at home.

Visibly shaken by the incident is the Iron Lady — Margaret Thatcher. Will she change her mind and recall the strong naval force despatched to the area? If events since the take-over are any pointer, Margaret Thatcher seems to be in no mood to go back on her promise of unfurling the Union Jack on the Falklands. She is already weakened by the resignation of her Foreign Secretary, Lord Carrington, and two others from the Cabinet, but after the Security Council calling upon Argentina to withdraw its forces, Margaret Thatcher is willing to defuse the crisis through peaceful means if the Argentine military junta is interested.

The voting at the Security Council (10-1) only shows that there are few backers for the Argentine action, at least in the open. That China and the Soviet Union abstained is to be noted. Also worth noting is the fact that when the United States placed an embargo on wheat sales to the USSR following that country's intervention in Afghanistan, it was Argentina which made good the loss. The Argentine regime would have expected some show of sympathy as a reciprocal gesture, but the Russians, realising the implications of the situation, thought it wise to abstain though the Soviet representative had, prior to the vote, told the Council that he would not support the British resolution because the problem was one of decolonisation. China on the other hand has called for a peaceful settlement through negotiations. Meanwhile economic sanctions have been called for against Argentina, but the numerous sanctions imposed on the South African regime having made hardly any impact only show that Argentina too can get away without being hurt.

The 2000-odd inhabitants of the islands who are of British stock are engaged in rearing sheep, the main industry of the Falklanders, had earlier expressed their desire to remain British and not become Argentines. Speculation is that the islands possess immense natural resources and the two large forces are all set for a confrontation over them. With Britain despatching two-thirds of its navel force and Argentina landing a large number of troops on the island during the past week, it is most certain that the 750,000-odd sheep on the islands will not get enough grass in the days ahead. For the British it is matter of prestige and past glory, and for Margaret Thatcher, her political career is at stake. Refusing to resign, she is committed to restore British rule on the islands. For Argentina it is 'reconquering' part of its territory.

Most nations including India have called for a peaceful solution but have done nothing more than that. Ronald Reagan said, "We are friends with both sides", and as such dispatched Alexander Haig to London and Buenos Aires as mediator. Of all European allies, Britain had been the most vociferous supporter of American policies, and as such the US would like to see that Britain's prestige is not lost. But as a friend of both sides the US. Administration is finding it all the more difficult to find a solution. Whether Britain regains Falklands or Argentina keeps it, there are bound to be repercussions. Already Venezuela has expressed solidarity with Argentina. Venezuela lays claim to 160,000 sq. km Essequibo territory, awarded to the then British Guiana by international arbitration in 1899. Britain has a few more colonies left with a total population of 5 million. Of these Hong Kong alone has 4.4 million. Many of these colonies have been in the news occasionally following claims by neighbouring countries. There is the case of Gibraltar which Spain wants. While most Spaniards believe that the Rock should be returned to the Spanish, a few Right-wing extremists advocate an Argentine-type invasion. If negotiations fail and if a person like Galtieri comes to power in Spain, invasion of the Rock will not come as a surprise.

The question now is whether at all Britain and Argentina will stage a naval battle. Britain with Harrier jets and nuclear-powered submarines in its flotilla now on its way seems to have an edge, but when it comes to distance Argentina has the upper hand, especially in terms of supplies and replenishment of equipment. Latest reports indicate that Argentina has withdrawn most of its warships from Falkland waters. With the British deadline for a military blockade of the archipelago, Argentina seems to have realised the risks involved in a naval battle. The British lion may let out a brief growl of satisfaction, but with Argentina soldiers still entrenched on the islands it looks as if Alexander Haig has little chance of early success in his 'mission'. (*April 12*)

DISCUSSION *Press Commission Report*

The Report of the Second Press Commission and the bulky note of dissent by four members were not available when this issue of *Mainstream* was being prepared. We are publishing here an article which is in the nature of preliminary observations on attitudes and approaches on some of the crucial issues, based entirely on inadequate press reports. A series of articles on different aspects of the Report as well as the Note of Dissent will be published in the coming weeks. The writer this week is an eminent journalist who appeared before the First Press Commission in the fifties and before the Second Commission in the late seventies on behalf of the Indian Federation of Working Journalists. A contribution from A. Raghavan, President-elect of the IFWJ, will be published next week. Editor.

Gospel According to K.K. Mathew

G.N. ACHARYA

FIRST thoughts are not necessarily the best thoughts. But there is this to be said in their favour. They come without having been subjected to the invisible blue pencil that gnarled, old ancients learn to carry in their heads — an expression of caution born of experience. The reason why there can be nothing more than first thoughts and some memories is that till today (April 8) I have nothing more solid to go upon than scattered reports which our newspapers have provided.

These scatterings have given prime importance to a 100 page note of dissent — almost a parallel report — submitted by four of the Commission's members, Justice Sisirkumar Mukherjee, Rajendra Mathur, Girilal Jain and Prof. H.K. Paranjape. This is an odd company. Odder still are the eloquent statements made by the Chairman, Justice K.K. Mathew, and K.R. Ganesh. From their past postures, pronouncements and actions—so far as I know them — I should have counted them as radicals who would stand foursquare among those arguing for freedom, more freedom, still more freedom. It is disheartening to find Justice Mathew talking in terms constitutionality, legality, competence. We go to courts of law to find out the limits of legality. We do not appoint a commission to find out what we can do within the existing law.

I am one of the diminishing tribe of people who were concerned — may be peripherally — with the First Press Commission. That was appointed on September 23, 1952, and it signed its report here, in Bombay, as we were allowed to look on eagerly, on July 14, 1954. The archival limit of 30 years is not quite past. But given the frailty of life and fading memories, I may be forgiven a bit of anecdotage.

As it happened, just before we were due to appear before the First Commission, there was a change of office-bearers. The late M. Sivraman, who was elected chairman of the Bombay Union of Journalists, had no time to assimilate the written material submitted earlier and be ready for the cross-examination. So he whispered to me to take over as the spokesman, and I nodded my rash head.

The late Justice G.S. Rajadhyaksha was a tough judge, and I was a raw recruit. At one stage H.Y. Sharada Prasad, who had not yet joined Government service, came to my rescue by reading out in his bold, clear voice what we had already submitted in writing. But such temporary alleviation would not have halted my fumbling, unless the Chairman came to something, the answer to which I was nervously fingering.

This is the story. An employee of the Press Trust of India, who must have long retired but I hope is still alive, had told me a few days earlier that the agency's teleprinters were used to transmit commercial private messages between some parties up country and others in Bombay. It may have been a private arrangement made by somebody in power, and may no longer exist. I asked him how I could tell a story like that to the Press Commission without evidence. He promised to get me the evidence. On his assurance we submitted a note. Luckily he was as good as his word. The night before, he tore off copy from the spare teleprinter, and passed on a bundle to me. I spent an anxious hour picking out the items containing messages from Jaipur and other places containing instructions to Bombay parties about bullion and shares.

Justice Rajadhyaksha also must have marked out our note on the subject for early challenge. He had half asked the question: "How can you say this...?" When I pushed across the bundle of papers to him and merely said: "Here, sir."

He started to go through the papers. As he scanned each message, he would turn towards the late A.D. Mani, who was a member of the Commission, and also then a director of the PTI. "Mr Mani, Mr Mani," his startled voice would say, "What is this? What is this?". Mani was struck dumb. So were the other members of the Commission to whom the scraps of paper were being passed on.

Meanwhile another smart member of the PTI staff — now retired, old and ailing like me — overheard the talk inside the room, rushed to his office not far away, and brought a copy of the day's commercial bulletin — a fat volume of cyclostyled information meant for market subscribers. The volume mysteriously reached my hands. I had just enough time to realise what it was, and as Justice Rajadhyaksha paused, pushed it towards him and said: "You might have a look at this also, sir." That started him off again on his "Mr Mani, Mr Mani" routine.

Our day had been won. Never again did any member question the veracity of our statements, or ask for proof. Once in fact, in relation to a note in which we had said that a weekly — *Forum* — had been sold for Rs 7 lakhs but the employees had not been paid their wages (the note had been prepared on his examination of the facts by the late B.S. Thunga), C.P. Ramaswami Iyer asked: "What has happened to the money?" The reply came not from the delegation, but from one of the members of the Commission, Rao Saheb Patwardhan, who said: They don't say there is money. There are only shares."

The point of telling this story — not just a point of senile irrelevance — is that Justice Rajadhyaksha was as legal-minded a jurist as was ever minted by the Bombay High Court. But as the facts were piled up before him, there was no more talk of legality, constitutionality, competence and such wholly legal concepts. That is why the Commission's report became so comprehensive and so informative — the first full exposure of the mysterious workings of the multi-headed hydra called the Indian Press.

The Second Press Commission, it is necessary to recall, was appointed by the short-lived Janata Government, on May 29, 1978, with Justice P.K. Goswami as the Chairman. A more gentle and fair-minded person it is difficult to imagine. Because of his sense of political propriety, the Commission submitted its resignation as soon as Indira Gandhi's victory at the polls led to the formation of a new Government. Strictly speaking, I do not think it was called for. For instance, the Chairman of the Press Council, the President and Vice-President, did not resign.

It is the reconstituted Press Commission whose report is displaying the obvious impact of political loyalties of proprietary affiliations. Justice Mathew, of all persons, says that it was beyond the competence of the Commission to discuss censorship during Emergency, because it is permitted under the Constitution and an emasculated Parliament had approved of it.

There are apparently some people for whom Emergency and all that was done under it are sacrosanct; others to whom it was an act of profanity which must be reviled on all occasions. Is it impossible to take a secular attitude? Personally, I plead guilty to the charge that at the beginning I welcomed Emergency as a necessary evil. Six months later I wrote that it had become counter-productive.

One of the curiosities of modern censorship is that the Censor gives no reasons for his diktats. Secondly, the paper which has been subject to any censorship orders is not allowed to disclose that such an order has been passed. The paper in which I was writing was put under pre-censorship of all its matter including advertisements, and the editor told me that this was because of what I had written about the Press and objectionable Matters Act. I want to take no credit for anything so much in the field of uncertainty. And that exactly is the reason why the Press Commission should have made a thorough study of how censorship worked.

The amazing part of the working of censorship during Emergency is that while there was a handful of small papers — some of which went to courts and obtained excellent, if unpublishable, orders from the Bombay, Gujarat and Delhi High Courts — the bulk of the press, particularly the bigger papers, carried on as merrily as before. They not only lived but prospered. With the solitary exception of the *Statesman* which preserved all the orders that the censors issued, and later published them in a supplement, no paper, as far as I know, has cared to preserve all the orders and correspondence with the censors. Sometime in 1976 Soli J. Sorabjee brought out a volume on *The Law of Press Censorship in India* (as it stood on April 19, 1976). But I doubt if it was publicly sold in India. Y.D. Lokenkar, who fought and won a notable case, published a book in Marathi. *Sadhana* of Poona also won a court case, and I am told has published the judgement in both Marathi and English. Despite efforts, I would not get a copy of either. I am only pointing out how difficult it is to get material about our late, unlamented censorship.

What a tremendous service to the unfolding of historical truth the Commission would have rendered, if it had used its enormous research facilities to merely produce a comprehensive report of the working of censorship under Emergency! To reiterate the legal position is easy. M. Hidayatullah, presently Vice-President, has put down the legal position pretty clearly in his Foreword to Soli Sorabjee's book. No apology is needed for quoting this extract;

"In America Freedom of Speech has long had a 'preferred position' because of the absolute terms in which the First Amendment is worded. Prior restraint, that is to say prevention of publication, as opposed to subsequent punishment, has always been in disfavour with the Courts. As Prof. Martin Shapiro said, 'if anything at all is clear about what the Founding Fathers meant by the language of the First Amendment, it is that it was designed to prohibit prior restraints' (*Freedom of Speech*, p. 152).

"Our Constitution has borrowed the language of the First Amendment in Article 19 (1) (a) but has put in some exceptions in 19 (2). Thereby the freedom is not as absolute as in America and for this reason our Supreme Court has denied that it has any preferred position...."

That is as things are. That is things as they ought not to be. From the very beginning, even from the days when the Constitution was in the making, the working journalists' movement has always demanded as much freedom for the Indian Press as the British and American. Right down to the first stage of the Second Press Commission, we have continued to ask for an amendment to the Constitution, which recognises the press as an entity, as it is bound to be in any modern democratic state. In the Journalists' Federation delegation that appeared before the Second Commission, I was once again cast in the role of a spokesman, by virtue of being a veteran. In the group was another veteran, J.P. Chaturvedi, who had also appeared before the First Press Commission.

Freedom of the press was the first question on which I was invited to express myself. This freedom has been compared to the space between encompassing walls — Constitution, laws, customs, proprietary powers, advertisement interests, political alliances and many more. Our interest is to push these walls as far back as we possibly can. Meanwhile we would like to open as many and as wide windows in the walls as we can.

Hidayatullah in the Foreword I have mentioned cites the ancient juristic authority of Sir William Blackstone: "The liberty of the press is indeed essential to the nature of a free state; but this consists in laying no previous restraints upon publications, and not in freedom from censure for criminal matter when published. Every free man has an undoubted right to lay what sentiments he pleases before the public; to forbid this is to destroy the freedom of the press; but if he publishes what is improper, mischievous, or illegal, he must take the consequences of his own temerity."

Although I have used the following quote before, I would repeat this 20th Century pronouncement against censorship. It is from Edgar Wallace's daily column "London Opinion," written when he was still a journalist, yet to become an affluent writer.

"Censorship has been established in India, naturally, because a censorship is the most powerful weapon that bureaucracy can wield. It hides their mistakes; it perverts the truth. It is a stupid and senseless instrument that is wielded by stupid and senseless men. It is the face-saver of officialdom. It qualifies rank failures for honours. It represents incompetent men as men of genius. It is the first and most alarming sign of political panic...A censorship is a liar's charter and hides nothing from the enemy...."

But Justice K.K. Mathew says that the Press Commission was not competent even to discuss the subject.

Let us remember two other declarations. V.C. Shukla, the author of censorship during Emergency, has declared that it was clearly a mistake and has explained that while it prevented the people from knowing certain essential facts, it also prevented the Government from knowing essential facts, including facts regarding the working of the minds of people. The consequences of this would indeed have been far-reaching but for the toomfoolery of Morarji Desai-Charan Singh-Raj Narain and company.

Indira Gandhi, prime beneficiary of this toomfoolery, has said there will be no similar Emergency in India for a thousand years: Amen!

The terms of reference of the Janata part of the Second Press Commission had some reference to the scope of freedom of expression being affected through trade union action. This had deeply disturbed the working journalists and other trade unions. Written protests had been made. Towards the end of the second day of the appearance of the Working Journalists' Federation delegation, the Federation's then President raised this question. Hedidn't get far.

and firmly: "If you think this Commission is going to recommend any curtailment of trade union rights, or any ban on strikes, it would be better if the Commission is dissolved here and now."

The brave Justice K.K. Mathew says the Press Commission was not competent to consider the most serious chapter of restraint on freedom of the press in our recent history because it was legal and constitutional. In that event, I humbly suggest, he should have followed Justice Goswami's logic and sought the immediate dissolution of the Commission, because it had lost its purpose. By his frailty in this matter, he has enabled the incongruous group of four dissenters to get away with a triumphant grin. "The Press Commission may well come to be known as the Press Annihilation Commission," they cackle. Having won credibility on one point, they can clothe all the rest of their interested business pleadings with the same credibility.

I have taken up a great deal of space in making one point. Therefore I shall only deal briefly with the vexed question of price-page schedule, and the proportion of news and advertisements. The judgements of the Supreme Court in the *Sakal* and Bennett Coleman (ten-page) cases have muddled up freedom of expression and business aspects of a newspaper.

Newspaper business has to do with machines, newsprint rolls, ink drums, advertisement tariffc and other sundry matters of cash and credit, accounts and balance-sheets. Freedom of expression is a matter of ideas, thoughts born in somebody's head, and the words and deeds that follow such thoughts and ideas. Since the 1880s the readers or newspaper-consuming public have not paid the full cost of the news and opinions they consume. This has been possible simply because the advertisers have been subsidising the media.

The public are slowly becoming aware of this because advertising and its availability is conditioning, the birth and death of newspapers, and has made their survival dependent virtually on becoming appendages to the consumer industry.

Nobody has yet found a way of total liberation. The limit of reform sought is to reduce the dependence of the press on advertising. This is the purpose of devising a price-page schedule — an idea which may already be running out of steam because of the high prices of newspapers. The idea of fixing the proportion of advertisement and news is that, assuming that what people buy when they buy a paper is news and views and advertisements are an adulterant to keep down the price, an attempt is to be made statutorily to keep down the extent of adulteration.

I fear neither the valiant group of warriors who have signed the majority report nor the minority dissent group have caught on to this simple point. The entire report seems to suffer from the lack of a single nexus firmly founded in well-considered principles. The sway of momentary interests mars the quality of both affirmation and dissent — despite the shallow ranks of the dissenters being enriched by an economist of the calibre of H.K. Paranjape. He sounded different when he was on the Monopolies Commission, as Justice Mathew and K.R. Ganesh did on other occasions. That is the disease of changing values in a rapidly changing socio-economic environment.

Maybe, Commissions are out of date. Political possibilities and economic advantages are the 'in'

Economy : Danger from 'Invisible Hands'

BHABATOSH DATTA

WHEN Adam Smith wrote on the harmony in the economic order brought about by the spontaneous action of each individual seeking his own interest and on the "natural order" and the "invisible hand", he could not have anticipated that, two centuries later, he would be quoted in support of policies enunciated not only by economists like Milton Friedman or F A. Hayek, or political heads like President Ronald Reagan or Prime Minister Margaret Thatcher, but also by that very class against whom he was sharply vocal. It is true that Adam Smith disliked state intervention (with some special exceptions) and controls over prices, wages or profits, but it is often forgotten that he was strongly critical of all types of monopoly in manufacture or in trading. Speaking about "merchants and master-manufacturers" he said that their interest

> is always in some respects different from, or even opposite to, that of the public ... The proposal of any new law or regulation of commerce which comes from this order ought always to be listened to with great precaution, and ought never to be adopted till after having been long and carefully examined, not only with the most scrupulous, but with the most suspicious attention. It comes from an order of men whose interest is never exactly the same with that of the public, who have generally an interest to deceive and even to oppress the public, and who accordingly have, upon many occasions, both deceived and oppressed it. (*The Wealth of Nations*, 1776, Vol. I).

Stimulated by the arguments put forward by those who combine their "monetarism" with a logically unconnected brand of *laissez-faire* economics, like Friedman, or by philosophical "libertarians" like Hayek, a strong industrial group in India has recently been urging "decontrol" and even "deplanning", with a view to bringing the "market forces" into operation. Examples are cited from Latin America, or from Singapore and Hong Kong, forgetting altogether the nature of the problems of a poor overpopulated country and also the income and wealth disparities created by the visible metropolitan prosperity thriving on extensive invisible poverty of large numbers. The case of Japan is sometimes cited, forgetting again the large role played by the Government in directing the development of the economy and also the failure of the new Japanese economy to solve the problems of economic justice and, more visibly, of severe inflationary pressures.

In India, the devotees of the "market forces" include political leaders and, of course, some economists also, but the main spokesmen who set the tune and conduct the orchestra are the big industrial groups. A remarkably clear exponent of these groups is S.L. Kirloskar, who recently urged a return to the "market forces" through a fourteen-point programme. (*The Economic Times*, May 1 and 4, 1981). It is necessary to state at the outset that many will agree with Kirloskar's analysis of the deficiencies and failures of the planning process in India, though they will not accept the thesis that these deficiencies and failures justify a reversal in economic policy. The substitute for inefficient planning is efficient planning. Kirloskar should, however, be praised for his honesty in stating the industrialists' position, with no holds barred and without any attempt to sugarcoat his suggestions. The individual policies recommended by him have been urged by many in recent years — in meetings of the Chambers of Commerce, in the widely-advertised chairmen's speeches at the annual general meetings of big companies, in political leaders' confident utterances, and in special articles prominently published in periodicals. Kirloskar has brought all these together and has given a clear picture of the needs of the economy, as viewed by the topmost one per cent of the Indian population. The fourteen points suggested for "immediate" adoption include:

> The abolition of "the Planning Commission with its vast bureaucratic superstructure"; denationalisation of all public sector industrial and commercial enterprises; dismantling of the "complex mechanism of controls"; repeal of the Monopolies and Restrictive Trade Practices (MRTP) and the Minimum Wages Acts: restriction of Government activities to the "basic function of provision of social and economic infrastructural facilities"; reduction of the rates of direct and indirect taxes; restricting the revenue of the Government "to just enough to meet the basic financial requirement"; abolition of the capital gains tax and reduction of the personal and corporate income tax rate to 30 per cent at the highest slabs, together with the raising of the exemption limit for personal income tax to Rs. 25,000 per annum: exemption from income tax of all personal and corporate savings invested in equity shares of industrial units or in deposits in public limited companies; tax exemption of all profits of industries for the first ten years; admitting liberal depreciation allowances on fixed capital on the basis of ruling prices of capital assets; putting a ceiling of 10.5 per cent on the interest on loans to private industry by commercial banks and financial institutions; and, finally, allowing "market forces" the "maximum scope for their operation".

All this has to be done "immediately" or "forthwith", so that one morning Indians wake up to the heaven in which the industrialists are free (the more powerful ones freer than the others) to produce what they find most profitable to produce, free of all controls, charge any price that the market will bear, get bank loans at low rates and pay low wages, combine together to earn tax-free or low-tax profits, retain large personal incomes openly, as all markets will be "white", and own and operate the denationalised public enterprises, including banking and insurance and "returned"

The author is Emeritus Professor of Economics, Presidency College, Calcutta. This article is reproduced with due acknowledgement from *State Enterprise*, quarterly review published by Standing Conference of Public Enterprises (Vol. 1, No. 1, January-March 1982).

sick units. There will be no central planning, while industrialists will be free to plan for achieving their own ends. The final peroration in favour of the "market forces" is in effect a plea for handing over the economy to the forces that the industrialists themselves can control.

It is this basic fact that has to be clearly recognised. There is an emotive persuasiveness about the argument for "market forces", deriving from what the elementary text-books describe as perfect competition. It is necessary, therefore, to keep in mind what the so-called "market forces" are, under a theoretically neat model of perfect competition and under the conditions of real life. The competition to which the "market-force" protagonists appear to appeal has never existed in any country at any time in history. It is a good expository model for starting one's discussion of price theory, justified only as the first level of abstraction, from which one can, by successive approximation, that is, by relaxing the assumptions step by step, approach the complexities of real life.

Even at the risk of appearing a little pedagogic, one has to emphasise some of the essential conditions of the perfectly competitive model: an infinitely large number of sellers and buyers, so that no seller or buyer can affect the price by changing his supply or demand; perfectly divisible and homogeneous commodities and factors, market by market; diminishing marginal rate of substitution between commodities and between factors; diminishing rate of transformation of factors into output; full knowledge and full mobility; full freedom for any buyer or seller to enter the market or to go away from it. Given all this, there is an equilibrium output in the industry as a whole and in every unit composing it, but whether such output is the social optimum or not depends on the accepted standard of distribution of incomes and assets. The basic facts of life are that not only the technical conditions of perfect competition are nowhere satisfied, but also that all buyers are not equally powerful if their incomes differ and that all suppliers are not equally powerful if their command over resources differs. What is often persuasively described as "healthy competition" is often a contradiction in terms. Competition in real life tends to be unhealthy, because of inequalities in the competitive power.

The fact is that, correctly used, the term "market forces", without its emotive slant towards the apotheosis of perfect competition, is broad enough to cover all types of markets. There are forces identifiable as operating in the theoretically compplete, perfect competition; there are similarly identifiable market forces operating in imperfect markets, in monopoly or "monopoloid" systems. The implication in all the pleas in favour of the "market forces" is that the controlled economy would revert to the theoretically neat competitive market when controls have been withdrawn, but the reversion is more likely to be to the market forces of monopoly or oligopoly and to a system in which large numbers of poor suppliers of labour and raw materials and the equally large numbers of poor consumers are at the mercy of the forces that would dominate the market. These forces would also be "market forces" and in the absence of controls could be called "free" as well.

II

ONE can look at the actual situation in India and see what is the nature of the "market forces" at present operating and therefrom also visualise what will be the forces in the "heaven" of the industrialists' dream. In general, agricultural goods are taken to provide examples of more or less perfect competition. In India, the number of producers in each of the major products is large, but there has been an emergence of large producers in some regions. None of the major products, however, is homogeneous, there being many varieties and subvarieties. Physical transportation problems often demarcate sub-market boundaries. Communication of information between one locality and another is also imperfect. An agricultural producer cannot easily go out to another line of production, even when he is persistently losing. He cannot wait for good prices. And, above everything, the market is imperfect and often "oligopsonistic" on the buying side.

The bulk buyers are on the stronger side of the bargain. This applies to foodgrains sold to middlemen; to sugarcane in which case the neighbouring sugar factory is a "monopsonist" in the locality; and to such raw materials as jute or cotton, in which case the real buyers are the big organised mill sectors. A return to the "market forces" will only strengthen the already strong buyers, who can use their resources, staying power and cartel-like understandings to influence the prices. These "market forces" are actually in operation, despite controls and Government purchases at pre-declared support prices. In the absence of controls and Government intervention, the market forces that will operate will not be closer to perfect competition but very much away from it.

The position in industry is equally one of high degrees of monopoly and monopsony. The Monopolies Inquiry Commission of 1965 defined a "dominant unit" in an industry as one which controlled 30 per cent of the total supply, and considered the market monopolistic if three topmost units controlled 50 per cent or more of the market supply. On this basis, the Commission gave a long list of industries containing dominant units and another list of industries with monopolistic elements. In the case of 810 out of 1,385 products examined, the topmost three enterprises produced more than 75 per cent of the output in the organised sector. Other detailed breakdowns were also given, and it was shown that 425 commodities were produced by only one producer each, 225 by two producers in each case and 160 by three producers for each commodity (Monopolies Inquiry Commission *Report*, 1965, Chapter II and Appendix *C*).

The position in the later years does not appear to have changed, despite the operation of the MRTP Act. The assets of the topmost industrial groups have increased considerably. The increases, it has to be remembered, cannot be attributed entirely to the rise in prices, because the assets are recorded in their initial book values and these book values are high only in the case of recent acquisitions. The total assets of 114 "monopoly houses" in the country went up from Rs 107,400 million in 1978 to Rs 1245,70 million in 1979 and their profits increased from Rs 16,580 million to Rs 17,910 million. Some individual houses have shown extremely high rates of growth. The assets of the Tata group increased from Rs 5060 million in 1969 to Rs 13,090 million in 1979 and those of the Birla group from Rs 4,180 million to Rs 13,100 million. These are likely to be under-estimates, because there are a number of allied firms and subsidiaries that have escaped registration.

The operation of the multinationals and their subsidiaries or "collaborators' has also expanded and even apparent competitors are bound down to them by sale agreements. One can take well-known examples of concentrated production or sales of basic chemicals, drugs and pharmaceuticals, cosmetics, baby food, shoes, tobacco products, electrical goods and explosives. The present position has been tellingly described by one who has a thorough knowledge of the field as follows:

> The concentration of economic power as represented by a small number of business groups has continued to increase, both in terms of their total role in the economy and their dominance in particular areas of production. Similarly, little success has been achieved in respect of curbing the monopolistic and unfair trade practices of the dominant and monopolistic concerns (H.K. Paranjape. Kale Memorial Lecture, *Mainstream*, October 17, 1981).

The attempt of the Government to maintain competition through reservation of a large number of commodities for the small-scale industries has not produced the desired results and the "market forces" have not become more competitive. The definition of small units has, after successive changes, reached a level (Rs 2 million of plant and machinery, or possibly Rs 3-3.5 million, including land and buildings and stocks) at which they are not quite small. The more important fact is that many of the so-called small units are open or disguised subsidiaries of large units, registered and operated as small units to take advantage of tax and interest rate concessions, to channel out the profits of the parent concerns and, more generally, to avoid the stigma of monopolistic operations.

An independent small unit finds the "market forces" operating against it, because of the strength of the sales organisations and the size of the advertisement and other sales promotion expenditure that the monopolistic competitor can undertake. The advertisement and sales promotion expenses are deductible for tax computation and thus the net cost to the large firms is relatively small. It is also well known that even Government stores purchase agencies sometimes specify brand names in their advertisements for supplies. The advantages specially meant for small units are almost all enjoyed by their large competitors through subsidiaries, while the disadvantages of the small units multiply with every growth of monopolistic competition.

The plea for decontrol with an ostensible view to restoring "competition" and "free" enterprise, has recently been accompanied by the half-educated appeal to what is being called "supply-side economics". Terms that the glossy magazines abroad start using are often taken here as the essence of progressive thought. It is not realised that the supply side is only half of the economic picture and the supposed dichotomy between demand management and supply management is meaningless. An economic model which ignores either the supply or the demand side cannot give a picture of the whole process. If, however, the only objective of the "supply-siders" is to emphasise policies that will increase output, the question that immediately arises is: "What output?" The actual market forces, as operating in India now and are likely to operate more strongly when "decontrol", "de-nationalisation" and "de-planning" have been adopted as basic state policies, will increase some supplies certainly. These will be the supplies of high profit luxury goods and consumer durables (including costly housing for the richer classes) and not the supplies of those goods which are relevant to the large mass of low income consumers.

III

THE public sector in India has much to answer for, but so has the private sector. The losses of the public sector enterprises are highlighted everywhere, but no one cares to find out what has been the total loss of equity-holders' and lenders' capital in the private corporate sector, how many companies have gone into liquidation in the last thirty years, how many (even though listed by the Stock Exchange) do not pay any dividends at all or pay at rates much lower than the deposit rates of interest, or how many have paid dividends to the "close-holding" shareholders out of capital. No spokesman for the market forces looks at the number of sick units, some beyond redemption, brought to the present stage by poor foresight, lack of innovativeness, mismanagement and sometimes unalloyed corruption. If the taxpayers are bearing the burdens of losing public sector enterprises, they are also bearing the burdens of the mistakes and malfeasances of private enterprisers. In the case of the state enterprises there is at least full publicity.

The basic fact to which one returns is that the actual "market forces" nowhere correspond to the perfectly competitive market in the name of which the economic case and the emotional appeal are sought to be made by the industrialists and their supporters. And even the perfectly competitive model is pointless as a social welfare model when the buyers and sellers are divided into economic brackets with wide divergences in purchasing and holding power. The market forces in real life are not controlled by Smith's "invisible hand" which was supposed to be spontaneous, automatic and impersonal. These forces are actually controlled by the "invisible hands" of powerful producers and traders who shape and operate the economy to attain their own interests. Some of the "hands at work" are occasionally visible, but the more dangerous ones are those "invisible hands" which control the markets through secret understandings, through apparently competitive brand names, through the complexes of interlinked firms, through purposive transfer pricing and through the influences exercised on policy-makers.

A surrender to the actual and potential "monopoloid market forces" in India will strengthen these "invisible hands". The industrialists' paradise that will be ushered in will be one in which the large groups will be free to invest in lines which they find profitable. They will be helped by relatively low interest costs, by unregulated wages, by uncontrolled selling prices for outputs and buying prices for inputs and by low direct and indirect taxes. The GNP, as estimated usually, will show an increase and perhaps a high rate of annual growth, but the composition of the commodity basket will be quite different from what the country requires. There will be no restrictions on the imports of luxury goods and the supermarkets in the metropolitan cities will be "flush" with imported goods (as in Hong Kong or Singapore), while the essential supplies will remain in short supply to the large masses of the poor. Income and wealth disparities will increase. Multinationals will find easy entry into the country and get the advantages of siphoning off local capital, while using local labour at a cheap price. Economic power will be concentrated in a few pairs of "invisible hands" (perhaps guided by other "invisible hands" out side the country), and as economic power is what ultimately matters, these "hands" will control the politics of the country as well.

The most distressing element in the present picture is that some of the recent policies of the Government indicate the success of the "market-force" protagonists in turning official policy to their favour. The industrialists' plea has been strengthened by the stiff instructions from the international financial institutions which continuously try to sell their own brand of economic philosophy. The raising of the income tax exemption limit to the high level of Rs 15,000 (making the effective exemption limit in many cases Rs 25,000 or thereabouts) in a country where the per capita income is only Rs 1,400 (1979-80); the reduction of the tax rates at higher levels of income; liberalising the rules of the valuation of property for wealth tax purposes; adoption of specially favourable measures for the holders of black money, like the "special bearer bonds"; subsidies which most often benefit the rich farmers; and exporters; tax concessions that provide incentives to make production less labour-intensive; liberalisation of imports of plant and machinery, even when these are produced within the country; relaxation of the rules regarding conversion of loans by financial institutions into equity; changing the established equity-debt ratios, with easy conditions for the issue of debentures; financial and other policies which practically invite the industrialists to make some of their units sick; the decision to return sick units to their owners — these are all much more than the proverbial straws in the wind.

They all indicate a positive slant towards a direction opposite to that required for efficient economic planning which seeks to secure economic growth in terms of the socially desirable components and economic justice. The "invisible hands" appear to be succeeding visibly in their efforts to maximise the private good of a top bracket to which belong or with which are associated the large industrialists, farmers and traders and also policy-makers at both the political and bureaucratic levels. Adam Smith's "invisible hand" was an abstraction. The industrialists' "invisible hands" are a sinister fact of life.☐

DISCUSSION

Scientific Temper

A Statement on Scientific Temper signed by outstanding intellectuals, released by P.N. Haksar at the Nehru Centre in Bombay (*Mainstream,* July 25, 1981), has touched off rethinking in a broad spectrum of our national life. Nine comments on the Statement have so far been published in *Mainstream* (August 29, October 10, November 14 and December 19, 1981, January 2 and 16 and February 6, 1982). We publish here two contributions: the first is by two experts, Harsh Sethi of the Indian Council for Social Science Research and Prof Dinesh Mohan of the Indian Institute of Technology, Delhi (the latter was a signatory to the Bombay Statement); the second is by Rajendra Prasad, a Marxist intellectual.—*Editor*

Time for Reason, Not Tantrums

HARSH SETHI and DINESH MOHAN

ONE wonders why arguments have to be so shrill. Assertions, counter-assertions and hysterical accusations become more important than the issues involved. The Scientific Temper (ST) document was meant to be an appeal for more "reason" in our lives, and the debate was expected to centre on the shortcomings of this committee document. Instead of focussing on this, the critics have used the document to ride their own hobby-horses. They have even questioned the right of those who have wielded power in the past, or are powerful at present, to make such pronouncements. This is a clever ruse, because all of us who can afford to participate in such a debate must share some of the blame for the situation our country is in. Pointing fingers is just abdicating responsibility.

The ST document communicates at many levels, depending upon how charitable one wants to be towards it. A consensus document from quite a divergent group, it gives vent to the feelings of distress caused by the "misery" and "oppression" the country is living through. It also attempts a superficial analysis of this sorry state of affairs. We cannot read the document in isolation. We read it in an era of conscious awareness of Bhagalpurs, Belchis, Antulays, "encounters" and rampant fraud in our scientific establishment. We are aware of the realities around us. Millions of people living in what have to be the most degrading physical conditions anywhere in the world. An inefficient administrative system which works mainly on misinformation heading towards a steady Brazilization of our economy and culture. A legal system, unable to handle the rich criminal, keeps itself happy by incarcerating and torturing the poor undertrials. An educational establishment which collaborates with state power in the stupefaction of the young while pretending to educate. A religious establishment which consciously eschews participation in social upliftment but can hold yajnas and Kumbh Melas with the approval of the state. A political leadership which can have as Cabinet Ministers persons who believe that the Ganga cannot be polluted, and as youth leaders those whose main claim to fame is their genealogy. What do we lack? Religion? Tradition? Living with nature? Manual Labour? Poverty? Cruelty? Obscurantist reasoning? Corruption? No, none of these.

The ST document is an appeal for something we do lack, and not a statement against the things we have in plenty. The ST document is an appeal to build a society "which is animated by a spirit of enquiry rather than passivity and acceptance": be questioning, be critical, rely on 'facts', go by testability and verifiability — these are some of the positive values it calls for. Equally important are the things it condemns: superstition, unreason, blind obedience, fatalism and passivity.

According to the document: "If we have to regain our place in the world and are not to be relegated once again to the dustbin of history, if we wish to offer a life of fulfilment to our destitute millions, indeed if the light of our civilisation is not to be extinguished, we have to undertake, on a priority basis, the task of nurturing the Scientific Temper."

How does all this sound? (Pompous? Yes, but what else? Is this a call for a new renaissance, or the manifesto of a totalising ideology? To decide this we must look at the ST document and its criticisms a little more closely.

To begin with, we must be clear about what we mean by "Science" In the current debate the word has been used rather loosely to score debating points with one's own admirers rather than to

Harsh Sethi is with the Indian Council for Social Science Research and Dinesh Mohan with the Indian Institute of Technology, Delhi. Dinesh Mohan is a signatory to the document on Scientific Temper.

improve understanding or communication. For the purposes of this article let us see what different visions one can conjure up when one talks of science. Science, to some, means the organised science establishment—complete with expensive laboratories and linkages with state power and war. The term "science" could also mean the present body of knowledge sanctified and approved by the scientific establishment. A third sense of "science" is the role and behaviour patterns of scientists as individuals and as members of a profession. Lastly, "science" is also the short name for the scientific method — the methods by which we determine, for the time being, whether a given assertion is close to the *truth* or not.

While all these roles and meanings are interlinked, one cannot have a reasonable discussion if the word is used with deliberate ambiguity by the participants in the discussion. The ST document deals mainly with the *method* of science in its most liberal sense. Its critics, on the other hand, have taken "science" mainly in its other three senses. The ST document does not really use the word science in any of its other three *avatars*. The ST document completely underplays the organised nature of science — with its links to big business, war and domination. It is silent on the quality and lack of contribution of the scientific establishment of India. It also avoids any discussion on what horrors may have been perpetrated in the name of science. The document does not address the question of arrogant scientists who can at times do more harm than good.

All this may sound like outright condemnation, but it is not. These are some of the problems associated with the world of science and they really cannot be wished away. But let us for a moment look at what some of the critics say. The pride of place must go to Ashis Nandy (*Mainstream*, October 10, 1981), and we agree with Rev. Paul Gregorious that had Nandy not reacted, the ST document would not have got as much notice (*Mainstream*, February 6, 1982). We also agree with him that Nandy's writing was a "horrid everstatement" and that "he has obviously missed the main point of the ST document which was directed against a phenomenon which frightens many thinking people — the growth of irrationality or retreat from reason, manifested in the recrudescense and popularity of religious practices (superstition and bizarre rituals) incompatible with a rational world view." But that is only a reaction to Nandy's worst writings. In many ways, his M.N. Roy Memorial lecture, "Science, Authoritarianism, and Culture" (*Seminar*, May 1981) is the piece which deserves a little more attention.

Nandy's presumption that all the signatories to the ST document are votaries of the Science Establishment is personal slander in bad taste. In no way does it add to the argument. Just as an aside, do Prof Damodaran, an active member of the Kerala Sastra Sahitya Parishad, Mohit Sen of the CPI, H Narasimhaiah, a staunch Gandhian, and V.G. Kulkarni, a promoter of science teaching programmes in Maharashtra constitute the Science Establishment? If Nandy chooses to read the ST document as an undifferentiated overkill, through the use of selective quotations, what sense is one to make of his undifferentiated critique of modern medicine, agronomy, and technology: "Recent experience has repeatedly confirmed that the so-called kindly sciences like medicine and agronomy are not merely cut-throat enterprises but are fast becoming counter-productive mega organisations, dealing out mega-suffering and mega-death" Yes, we are all aware of *iatrogenesis*, but Nandy's statement is hardly a true picture, unembellished as it is by any qualifications. He also treats us to gems such as: The common man is not so common after all", or to the extolling of popular wisdom and folk cultures ("under-socialised" is the term used). But enough of sniping. The major contribution of Nandy's (at the risk of over-simplifying and caricaturing him) is his pertinent reminder that science and culture and consciousness are both products and creations of history; that there is no unique perception to a unique truth; that any attempt at creating a universalising paradigm that does not admit any external criticism is likely to facilitate totalitarianism. Thus his appeal for a plural vision of sciences and humanity. So far so good, but we are still left with a number of imponderables to chew on.

What is Nandy's notion of "critical traditionalism"? To quote: "The authentic critical traditionalism I am talking about does not have to see the modern world or modern science as alien to it, even though it might see them as alienating. It sees modernity and modern science as parts of a new tradition which could be used for critical purposes within the earlier traditions and their long-term concerns" (*Seminar*, May 1981). How is this view to be reconciled with his other view that modern science is over-objectified, that it is over-isolating, that it has become another pathological correlate of the demise of traditions and erosion of cultures?

Similarly, let us for a moment examine Nandy on traditions. Just as he argues against an over-isolating science, he argues against over-isolating traditions. The example he uses is Coomaraswamy's critique of modern civilisation, which while being brilliant, is not critical, "because it leaves no scope for anti-traditionalism, and also, in spite of being holistic by design, it does not allow any creative use of the modern consciousness". The problems now are two: Do modern science and tradition come to us as packages, the good along with the evil, or can we pick out what we consider good from both and create a new organic viewpoint? The case for the former has been argued out by Coomaraswamy as also by Saran. If Nandy rejects them, then, we are afraid, he has to go beyond idealised exhortations.

One continuously gets a feeling as one reads and re-reads Nandy that he overplays the "undifferentiated nature of modern science", and underplays the "undifferentiated nature of traditions". This is mainly because of a distinction he draws between early modern science and present modern science. What was once a critique and a dissent to the then existing meaning given to the man-nature system is now portrayed as an onslaught on human survival. Tradition, being of the past, can be viewed more benigngly. But is this justified?

And so Nandy can present science and/or tradition as over-objectified, isolating wholes for one argument, and differentiated entities for another. If 'critical traditionalism' is acceptable, then so is, by the same argument, "critical science."

Another major problem that we face in understanding Nandy is the notion of "plural sciences". Even if one grants that in earlier times contending schools of thought could co-exist, and compete, and grow (for example, the different schools of medicine in India, prior to the elevation of allopathy as the medical science), it was so because it was earlier times.

Let us take the example of medicine. If in earlier times many different systems could co-exist it was because no system had an edge over another on the basis of knowledge alone. Fundamental assumptions of each school were different from those of the others and there were no *a priori* reasons why one could claim superiority over another, except belief. However, the total fund of knowledge in Western medicine has increased greatly in the last century while the other systems have remained static. If others are showing a resurgence now, even their staunchest supporters would like to use the tools of modern science — controlled experiments, statistics, etc. — to weed out the bad practices from the good. Even Nandy's "common people" all over the world demonstrate a preference for Western medicine over traditional for a large number of ailments. If they are wise, then Western medicine must be superior. If Western medicine is not actually superior then Nandy's common man must be common after all. One can't have it both ways.

Nandy says that "the common man has not only his traditional or folk science, he has his own philosophy of science. It might be vague, implicit and non-professional but it is informed with the experience of suffering. Such folk sciences and philosophies must be taken seriously". Now, we know that a tribe in Madhya Pradesh treats its infants colic pains by placing burning embers on the children's bellies in the belief that the pain is cured for ever. Would Nandy use the same treatment for his child? If not, what logic system would he use to select some knowledge and reject another when both are informed with the same "experience of suffering"?

It is easy to demonstrate problems with a system, it is a little more difficult to argue an alternative. The social forces that Nandy appeals to — folk and popular cultures (in themselves not specified enough) —have, by his own logic of a totalising ideology of science, lost the capacity to fashion an alternative in a complex, inter-dependent world. their intellectual idealogues notwithstanding. They have lost out in the real world, not because they were ethically or morally disgraced, but because they could not provide the necessary cohesion to a social force which could contend for an autonomous place in this world. But if Nandy thinks that these forces are still viable, we think it is necessary for him to demonstrate how. A major problem with this kind of critiques is that they argue that at some stage in world history, there was a major disjuncture. The winning out of the Cartesian logic in the 17th Century meant that the modern world embarked upon a course which eventually will lead to its own destruction. This is implicit not only in the critiques of technology now so fashionable (Illich) or in the "notion of man colonising nature" now leading to the possibility of an ecological breakdown, but also in Nandy's descriptions of "early" and "now over-organised science". The glorious march of human kind from the caves to the medieval civilisations, was rudely diverted towards cataclysmic doom.

Are we serious when we argue that for over 300 years humanity has followed a course which, in the name of increasing control over the environment, is reducing the probability of mankind's own reproduction? In the A.K. Saran, Coomaraswamy, Dr K.P. Gupta frameworks, we could possibly argue this out, because then incontrovertible decisions have already been taken, but not if we believe in a trend notion of "progress", and definitely not, if we continue to make appeals, to "the common man who is not so common after all". If this "common man" is blessed with the potentialities of overcoming 300 years of deadweight, then what happened to him over the last three countries? Or is it that the disjuncture was no disjuncture after all?

There are a few more red herrings thrown our way. Vandana Shiva (*Mainstream*, December 19, 1981) is upset about "Western" science and seems to have some vision of "plurality" of sciences. Many others go to the extreme of advocating an "Indian" science. Such statements can only be made if the word "science" is used to mean the *origin* of a body of knowledge. If they mean that any one group or nation can have its own unique methods of evaluating and understanding information or phenomena. then they couldn't be talking of the situation in 1982. In the middle ages it may have been possible for different communities to use different methodologies. Not so today. All of us, all over the world, use similar "tools of thought" to test theories and evaluate information. These tools can be induction, deduction, statistical evaluation, modelling, systems analysis. etc., to corroborate or falsify theories. Even if Indians came up with newer tools, it would hardly be an Indian science, because if it worked it would become international immediately.

An argument against science often offered is that sometimes modern science initially rejects traditional knowledge only to accept it later on. We would have thought that willingness to change would be a point in favour of science! We are sure that most would not argue in favour of everything that is traditional. It would then justify pouring hot oil in children's ears, putting cowdung on the newborn's umbilical cord, binding women's feet, making women untouchables during menstruation and so on. I am sure that the proponents of plural sciences do not approve of these practices. If they don't, why not?

What tools of thought do they use to make their decisions?

It is possible that the unhappiness with "science" stems from people's discomfort in living with uncertainty. Unfortunately the universe is complex and all "proofs" are tentative and we cannot reduce our world to a set of transparent laws. On the other hand, one of the greatest joys of a scientist is to occasionally show "common sense" and existing theories to be wrong.

The nature of the debate so far shows that the concerns of the debaters are not so different. In a sense, everyone is upset with the way things are — our misery, the exploitation, and powerlessness as poor ex-colonials in a world controlled by the superpowers and the multinationals.

Somewhere in this muddled-up world we have to make choices. Assuming of course that time will not run out on us. We have to understand that some of the traditional ways of understanding reality are just too slow and we may not be left with any choices to make unless we use all possible modern tools of thought to shape our future. We are not making a plea for a free hand for our super-scientist-bureaucrats. On the contrary, we are quite aware of the rot in our scientific establishment and "elite" institutions. We are also not rejecting all traditional knowledge. All we are asking for is a reasonable *evaluation*, otherwise we will end up buying *our* traditional knowledge from foreign multinationals and academics who do this evaluation instead of us. We are also very clear that as a continental economy, sooner or later we will have to come up with *some* knowledge and technology which is competitive with that produced elsewhere. We will need this in exchange for the goods that we need from abroad. We cannot go on exchanging jute, tea and handicrafts for Boeings, Xerox machines and fertiliser. Our labour rates will have to remain low unless we can compete in some areas of technology.

Such technology and knowledge particularly suitable for India's needs cannot be produced without the application of the current tools of reason and analysis. How can we be autonomous as a people if we are weak in an inter-dependent world? Retreating into the past would be admitting defeat. And this, in spite of their protestations, is what we think Nandy and his supporters have done.

We are still left with the problem of making choices and decisions. Being urban, middle class, and aware of happenings elsewhere in the world, all we can say is that we would rather go by what we can assess, test and verify for ourselves. If we are wrong, it would be useful to have an ethos which permits civilised debate and change of opinion.☐

A Political Question

RAJENDRA PRASAD

If the Statement on Scientific Temper, issued last July by a group of eminent public men, is a muddle-headed, logically contradictory attempt to understand the process of growth and development of science and society, Ashis Nandy's counter-statement is both phoney and pernicious. The former, paying lip service to the significant role of science in creating an egalitarian society. believes that the Indian ruling classes can deliver the goods provided only that the logic of planning and the logic of our socio-economic structures are "scientifically" harmonised. The latter is an unashamed defence of the status quo which couches its glorification of obscurantism in a presumptuous philosophy.

Regarding the Bombay Statement, a crucial question is why despite the political thrust provided by Jawaharlal Nehru, the attempt to 'inculcate a scientific temper' not only failed, but led to the phenomenal growth of superstitious beliefs and obscurantist practices. The Statement does not explain this fact, but identifies two apparent causes for this failure: firstly the lack of appreciation of the relationship between means and ends and secondly, a "lack of systematic and sustained effort". The first is a lapse on the part of what the signatories would have us believe is the whole of science: the second is attributed to the role of prevalent pro-and anti-scientific ideologies. For at one point the Statement refers to "deep-rooted structures of an ancient society with superimposed colonial structures". But this is no explanation at all, but simply describes a situation in which scientific attitudes have not been socially imbibed.

The failure of the Statement to come to grips with the question can be understood at two levels. The Statement presents a totally ahistorical perspective within which the process of social development is sought to be understood. Social advances and transformation are claimed to be a product of "the spirit of enquiry" while periods of stagnation result from the deadening of this spirit.

Where no attempt is made to identify the social groups or classes benefiting from the maintenance of the structures of an ancient society with its superimposed colonial structures, no attempt can obviously be made to pin down those social forces responsible for the visible variance between professed objectives and actual realities. A simple fact which has escaped the men of learning is however evident to a field-worker like Anil Sadgopal who, in his Sarabhai Memorial lecture, unambiguously stated that the ship of scientific temper flounders on the rock of vested interests.

The Statement presents a totally ahistorical perspective. In what amounts to a reversal of causal relationships, "the spirit of enquiry' acquires an idealised and unrealistic independence from the social forces of which it is in fact the expression. The theoretical weakness impairs understanding of the significance of both social policy and the direction of social chages. While it is correct to assert that British Imperialism encouraged revivalism and obscurantism to suit its interests, it would be a travesty of truth to claim that the national movement was the outcome of "a critique of traditional society". The national movement witnessed not only a struggle against social obscurantism but also conscious with it. Some of its outstanding leaders invoked obscurantist ideas and symbols to mobilise the people. To overlook this duality, to neglect to identify the class interest behind this apparent vacillation. Is to lose the capacity to grasp the nature of the drift of policy in Independent India.

The authors of the Bombay Statement in trying to skirt the basic issue that the scientific temperament is a component of the ideology of the class which can revolutionise society (as it was with the bourgeoisie in its struggle against feudalism), avoids what is in fact the crucial point. A correct political perspective is essential if scientific attitudes are to be inculcated in the great mass of the people. The present statement is so far from this that it lands itself in a vicious circle. "The inculcation of scientific temper in our society would result in our people becoming national and objective, thereby generating a climate favouring an egalitarian, democratic, secular and universalist outlook. Consequently scientific temper cannot flourish in a grossly inegalitarian society ... social justice, widespread education and unrestricted communication are, therefore, pre-requisites for spread of scientific temper." From this chaotic formulation one could logically conclude that India today has no room or need for "scientific temper" as this has no role to play in the struggle for a rational, egalitarian social order, being only the hot-house flower that blooms when the struggle is over.

Nandy's counter-statement arguing for a more humanistic temper (the problem of quantification presents no difficulty, for Nandy's is a purely "ideological" argument), is based on a single categoric statement: "Oppression never ends. When one form of oppression ends, new forms emerge". His 'humanism' thus consists in seeking palliatives and not solutions. The entire exercise is spurious, for Nandy cannot distinguish between elections and witches, each myth being no worse than the other. On such myths, Nandy grounds 'human dignity', making a mockery of the struggle of the human race to advance the parameters of understanding and control. Nandy's status quoism forces this posture, for "astrology is the myth of the weak; modern science that of the strong. If you have the latter you have to have the former". Since Nandy does not question this division, far less join forces with those struggling against it, what could be better than to provide a 'justification' for it?

The real control which scientific knowledge offers human society of its environment and therefore its destiny is discounted by Nandy, while politico-administrative policies which have exploited this to the detriment of humanity are placed at the door-step of science. If science demands that other 'systems of thought' be criticised from its point of view, Nandy demands that science equally must be open to criticism by the standards of faith. This is ridiculous, for scientific ideas must be open to scientific criticism and so indeed they are. It is the worst kind of opportunism to deny this in the name of 'equality of cross-criticism'. It leads poor Nandy to the absurd conclusion that incantations are perhaps better than vaccines and anti-septics for the latter provide psychological satisfaction.

Of course, this pseudo-philosophic posture is not without important political or intellectual support. US President Reagan during his election campaign argued in favour of treating both the evolutionism of Darwin and the creationism of the Bible as 'scientific.' At a far more sophisticated level Feyerabend, the self-proclaimed anarchist and flippant dadaist whom Nandy holds in such esteem that he feels every "literate" should be familiar with his arguments, has provided intellectual currency for this trend.

Nandy drops names of Western philosophers of science. It is on the authority of a person like de Santillana that he claims that in the case of Galileo, "It was the Church which proved itself more open and sought to have plural images of the Cosmos. Galileo, like the signatories to the Statement, thought he knew the truth and wanted to oust all other concepts of truth." It is worth noting that de Santillana himself contrasts the relative 'openness' of the Church not with Galileo's attitude, but with the posture of the Committee on anti-American activities which subjected Oppenheimer to investigation in the fifties. That Nandy is being dishonest and not merely incompetent in overlooking this fact is evident from de Santillana's views regarding Galileo: "Galileo had no advocates in court, nor was there any discussion of the Copernican theories as such. Galileo was not allowed to defend his scientific work: the only question was, had he disobeyed the Church or not?" Further, he observes that "all efforts were bent towards keeping social forces under the firm control of a consistent philosophical motivation." (*Reflections on Men and Ideas*).

The two statements which appear to be irreconcilable at the level of ideas alone, are compatible in that both fit into the ideological framework of the ruling classes.

On the one hand, these classes are interested in utilising science both for production and the management of society to the extent that this furthers their interests. But on the other hand their capacity to modernise Indian society while retaining their political and social dominance is severely limited, which leads increasingly to the need to ally with obscurantism and reactionary socio-political trends and offers itself as the best solution to the problem. Within this perspective the Bombay Statement can be seen as an idealised and, given the reality of Indian development in the last few decades, nostalgic expression of ruling class interests, Nandy's counter-statement is an unabashed attempt to legitimise the war against scientific advance of social life and values unleashed by the bourgeoisie in both developed and developing capitalist countries.

Abolition of oppression and inequality, and the urge for modernising society are feasible social goals only when science is allied to the social forces capable of revolutionising society at the present historical juncture. Hence the question of the spread of the scientific temperament is fundamentally a political question to which there can be no voluntaristic solutions.□

Should India Go Nuclear? — II

KRISHNA KANT

THE next point — that unity of the nation and strength of will are adequate to meet a nuclear threat, hence we should not go in for nuclear weapons even if our neighbours make them or we are surrounded by nuclear weapons all round — has been substantially dealt with earlier. In 1962, when our forces had a setback in the Kamang division mostly because of failure of the local military leadership, there was wide propaganda in the country that our failure was mainly due to the Indian Army not having self-loading rifles and mortars of adequate range. Yet, there are people, even generals, who advocate that India should be able to face a nuclear China and a nuclear Pakistan without our own nuclear arms just by being united and having the strength of will. It was not that in 1962 the country lacked either the unity to face the Chinese or strength of will to resist them. Yet it was quite clear that these qualities were by themselves not adequate to resist the enemy in the battlefield. Similarly at present it does not make sense to advocate that the Chinese or the Pakistani or other nuclear threat can be resisted by unity and strength of will. It would further mean that we have not learnt any lesson from our long history.

Lt-Gen S.K. Sinha, the Western Army Commander, in his recent lecture at Kurukshetra University on the Three Battles of Panipat, while referring to the lessons to be learnt from them said:

> "We must not allow the invader to have the better of us in either equipment or tactics. Babar had firearms which Ibrahim Lodi lacked. Bairam Khan's horses and archers greatly surpassed those of Hemu. The camel-based light artillery of Abdali was far superior to the heavy and crude cannons of Bhausaheb. All this implies that we need to keep a watchful eye on development in equipment and technical doctrine in a fast-changing modern world. Our armies facing the aggressor should not be allowed to be handicapped on this account."

May I deal with two more aspects before looking at India in world affairs. In the first instance may I refer to the point made by some that nuclear weapon capability will make the government dictatorial and more ruthless, taking away civil liberties and human rights. This again is what our elite have learnt from others. Bertrand Russell in his *Which Way to Peace*? written in the thirties has argued that the chaos caused by the air raids would make martial law essential: "A war in defence of democracy would necessarily begin with a military despotism, and there is no reason to doubt that it would end with one. The end of all the deaths and destruction will be the substitution of an English Hitler for the German one". History proves that neither Churchill nor Roosevelt turned dictatorial. The British electorate voted out Churchill within three months of his winning the war against Germany. Our elite and many so-called Gandhians have only taken this Russell argument further after the coming in of the atom bomb and other nuclear weapons.

The fact is that neither the British became Nazis nor democracy came to an end. After the war the British colonies became free and Britain continues to be governed by a two-party system with Liberals and a new Social Democratic Party trying to form a third coalition. Nuclear weapons have not changed the ideology of either the USA or the USSR. We may add they have not changed either France or China. Development of nuclear weapons is as much neutral to the structure of the state as conventional weapons. To put down civilians even ordinary bombs are not required. The Shah of Iran had remarked after losing his throne that sophisticated radars, tanks and aircraft were useless to put down the popular upheaval. What he lacked was the water cannon. Rifles and machine-guns are the most effective weapons for terrorising the population. Only this simple equipment was used by Yahya Khan, Idi Amin or Pol Pot for repression and genocide. Zia ul Haq, who is hailed by many of our doves as a great peace-maker, has added whipping and amputation to the instruments of terror.

Another question being constantly asked is whether the nuclear weapon option will not very much add to defence expenditure at a time when serious attention needs to be concentrated on economic growth and poverty removal programmes.

It must be realised that raising the quality of life is as important as the nation's capacity to safeguard economic growth. But both are not possible unless the security of the country is first ensured. Immediately after the Second World War, the United Kingdom and the Soviet Union went in for nuclear weapons when their economies were recovering from the ravages of war. If Pakistan with one-tenth of our resources can go in for a nuclear weapon programme, there is no reason why India cannot. When China went in for its nuclear weapon programme, its resources were roughly of the order of what we have today.

THE gap in the cost of conventional and nuclear weapons is narrowing. A reactor to produce plutonium for fifteen bombs per year will cost less than Rs 100 crores. A rocket or a missile to carry the warhead will cost slightly more than Rs 4 crores

The author is a former Member of Parliament. This is the second and concluding part of the Capt. G.V. Modak Memorial Lecture delivered by him under the auspices of the Ahmedabad Military and Rifle Training Association at the Military Education Campus, Khanpur, Ahmedabad, on February 19, 1982. The first part was published last week in *Mainstream* (April 10, 1982).

to 5 crores each, like our SLV 3, while a conventional aircraft like Jaguar today costs more than Rs 9 crores, and the new Mirage-2000 may be twice as expensive. We were prepared to spend nearly Rs. 1500 crores on the Jaguar programme. The Mirage-2000 programme will be far more costly compared to these. Nuclear weapons are therefore comparatively cheap. Following the Chinese attack, Morarji Desai, the then Finance Minister, agreed to raise the country's defence budget to nearly four per cent of the GNP. At that stage the country's savings was only 11 per cent of the GNP and with another 3 per cent of foreign aid, the country was investing 14 per cent in the development programme in 1963-64. Today India spends around 3.8 per cent on defence. Last year's estimate of Rs. 4,200 crores for defence is likely to be just the same four per cent that Morarji Desai had given.

Our savings have gone beyond 20 per cent with more outlays on investment. Still our growth rate remains the same mainly because of adverse capital-output ratio which is due to mismanagement, corruption and inefficiency.

There are many areas of defence in which there can be savings. A new strategy has to be worked out to meet the challenge of new strategic environment. That will require an appropriate balance between nuclear and non-nuclear forces. Our defence establishments have to be reoriented. They have to be constantly balancing our conventional requirements with the nuclear deterrent at different stages of its development to get the optimum advantage out of our capacities and resources. For example, our basic Rohini Rocket has to be considerably improved to carry adequate payloads over required distances. But the Jaguar can serve as a credible delivery system for the time being as in Europe. We have to reassess our requirements of Jaguar and Mirage-2000 in the new context. It is possible to meet the whole defence expenditure within the modest estimate of around 4 per cent of GNP. Compare this to Pakistan's expenditure which is said to be around 6 per cent. But even the US Congressional document says that Pakistan's defence expenditure is heavily subsidised by foreign donors. China spends not less than 5 to 7 per cent of its GNP on defence.

Therefore the nuclear deterrent programme need not divert much money from poverty removal projects. Every one knows that poverty removal is handicapped because of political reluctance to implement land reforms, remove black money and increase efficiency in economic management.

HAVING looked at the various aspects of the nuclear issue, let us examine the basic question as to how we look at India's destiny. It is not merely a question of relationship between India and China or India and Pakistan which is the real question. What has to be India's potential role by virtue of its size, population, resources, history and geography? Have we every time to place ourselves in the position of Pakistan, Bangladesh, Nepal, Thailand, Malaysia, Indonesia, Singapore, and determine our role? It is an irony that instead of looking realistically at the problem as Indians, arguments are articulated and propositions put out as if they are being advanced on behalf of the Chinese, the Pakistanis, the Americans, the Russians, the Bangladeshis, etc. When we fought the battle of freedom Gandhiji's idea was the liberation of mankind, the brown, the yellow and the black peoples. All nations big or small struggle have to grow according to their potential. The idea should be to grow ourselves and help others to grow so that the have-not nations also acquire power and status to stand up to the industrialised nations. This does not and should not mean that we in India should accelerate or decelerate our programme so that no neighbours or littoral states of the Indian Ocean feel concerned about our bigness or advancement. Such concern should originate from the attitudes and policies of this nation as well as our historical behaviour, our moral and political traditions. During the last 35 years after Independence we have never initiated a war. On the other hand, our neighbours have attacked us and captured our territories — and large areas of the country are still under occupation. This has been the result of doubts and confusion as to our destiny and goal.

We wanted to play a moral role in world affairs and defence preparedness always occupied a very low place in our thinking and planning. Is it not a fact that India had very modest defence capabilities till 1962 while China with Russian support and Pakistan with US support were arming themselves? It was only after 1962 we started building up our infrastructure to support a modern army. Up till then we had only what we were given by the British. The MIG agreement was signed in 1962.

When China occupied Tibet, India, instead of resorting to confrontation, signed the Panchsheel agreement in 1954. Though China had started claiming border areas in 1956, and first border intrusions took place the same year, India did not exert itself sufficiently to modernise the defence forces to meet the threat. Neither Bertrand Russell nor other pacifists helped India when China attacked India, except for giving the advice not to continue fighting and to save human lives and even leave the territory under Chinese occupation. But they never dared to give such advice to the Chinese.

In 1965, when Pakistan attacked India, in the Rann of Kutch, India produced proof of use of American weapons and yet the Americans did nothing to stop Pakistan. That encouraged Ayub Khan to send infiltrators into Kashmir. He was preparing his infiltrators even as India and Pakistan were signing an agreement for arbitration over the Rann of Kutch. This is what happens when one does not learn the lessons of history. Our decision-making elite are not power-oriented and they always find it difficult to understand the role of power. Rajaji and Acharya Kripalani used to be critical about India's defence expenditure before 1962, but were the first to criticise Nehru and the Government for non-preparedness when the Chinese attacked.

The role that India and Nehru could play after independence was born out of the image of India during the freedom struggle as leader of the upsurge of the entire colonial world and the image of the Indian Army during the Second World War. That image waned when the Chinese invaded India. The global power struggle is a reality and in that power plays a crucial role. The role of Nehru and India changed after the Chinese attack in 1962. As long as the world is divided into sovereign states and each state is committed to furthering its own interest, the power game among the nations will continue. This is regardless of the economic imperatives which have been forcefully demonstrated in recent times and there is a much greater degree of inter-dependence among nations. The growth and development of non-alignment is a solid expression of the urge of all independent nations to assert their identity even along with their dependence on the super-powers and industrialised nations for economic and technological help.

The only destiny or aim for India can be to become an independent centre of decision-making in the current international environment. That is possible only by strengthening our strategic defence which includes strategic nuclear defence. No foreign policy can be independent if we are not capable of dealing with potential adversaries. We are not independent even in conventional weapons. Independence in defence technology is a long-term process, and the process has to start with a clear perspective. China was way behind India in nuclear technology and is probably behind us in civilian nuclear technology even now. But it has surpassed India in nuclear weapon technology by 7 to 10 years and it was with this advance that it made its debut in international affairs when Nixon had to say that China with a population of 800 million and nuclear weapons could not be ignored. The China factor cannot be ignored in our calculations, for strategic defence. The gap that has come about is not insurmountable.

At a recent secret seminar in Brookings Institution in the USA, experts from a large number of institutions and official agencies discussed the question of developing military relations with China. During their assessment of China's present military capability some experts expressed the view that "India appears to have a slight edge over China in a conventional weapon computation though lagging considerably behind the People's Republic in nuclear capabilities ... The Chinese air force is considered inferior to that of India although China has the advantage of number of planes. China's logistics system is also inferior to that of India. By contrast, however, China's nuclear weapons and delivery systems are judged far superior."

According to an assessment made by the CIA and US intelligence experts, China is the only developing country possessing a strategic missile system capable of reaching both super-powers.

China, after having achieved nuclear weapon capability, will take at least ten years, according to experts, to carry out modernisation of army and conventional weapons. But it has already drawn up its perspective plan and taken political decisions relevant to it.

SO INDIA has to make a start with a clear political decision. But the Indian political academic and even economic elites have already started drumbeating with Western-inspired doctrines that high defence expenditure is not good for the country. Here one is reminded of Indian history. It was not a very large number of Britishers who conquered India for Britain. Hardly a few thousand had come to India. India was conquered by the Bengal Army, the Madras army and the Bombay Army made up of Indians serving the East India Company and was handed over to Britain. Similarly, at present our own people want to keep this country in a servile position vis-a-vis the Western countries. Our elite are now only reflecting the spirit of India of the 17th, 18th and 19th centuries. When the British came to India, the Indian industrial level was not very much lower than the British level. Some of the ships used by England to win the battle of Trafalgar (1805) against the French were bulit in Mazgaon Docks in Bombay. To bolster Lancashire industry the British cut off the thumbs of Dacca muslin weavers. Those who are now propagating a Sane Nuclear Policy, and against development of nuclear weapons, or for signing NPT are like those who supported the cutting off of Dacca weavers thumbs.

Some people are worried about world reaction to India going nuclear. All five nuclear powers may oppose it since it would be an act of assertion by India of its independence and a measure of India's self-confidence and willingness to defy the present international power system. But it would also compel the rest of the world to pay attention to the legitimate role India is seeking to play in the world. In the past the big powers have shown such accommodation. The rest of the world, whether of the East or the West or the Third World, needs India much as India needs them. Chinese development of nuclear weapon capability brought more recognition and support to that country, both technologically and economically rather than diminish them. The door slammed on China's face was opened wide and the Chinese were given a red-carpet welcome.

In India two types of criticism are to be faced by those who advocate nuclear weapons for national defence. The Left was opposed to it inspired by the World Peace Council and for them Soviet nuclear weapons alone are enough guarantee for our security. The others feel that India acquiring nuclear weapons will lead to proliferation — a development opposed particularly by the West and also by the Soviets. Both are wrong.

No nation has built up its nuclear weapon capability with the tacit help of others except South Africa and Israel which have been clandestinely helped by the West; Russia did help China in the earlier stages but not for the bomb, but only in enrichment technology. The United Kingdom and France became nuclear weapon powers on the basis of their own technological capabilities. Much more so the Soviet Union. After the Second World War Bertrand Russell advocated a pre-emptive surgical American nuclear strike on the incipient Soviet nuclear facilities to prevent a communist country becoming a nuclear power. If the Soviet Union has become a nuclear weapon giant it is solely on its own strength and capacities. Once the Soviets had achieved nuclear weapons capability Bertrand Russell argued it was better to be Red than Dead! Today we have the infrastructure and the technological capabilities and we will have to exercise our option on our own without the help of any nuclear power.

It is true that the Soviet Union has been our consistent friend, whether it was the issue of Kashmir, Goa or Bangladesh. Our friendship is dictated by our mutual geo-strategic interests. But all countries keep their options open. After the Tashkent agreement the Soviet Union opened its arms window to Pakistan. That was because the Soviet Union felt that India was weak and it could deal directly with all countries of the sub-continent as it liked. If India is strong then no other nation outside this area will be able to ignore our sensitivities in dealing with other countries of this region.

So, there is no other alternative available to India except to keep the country prepared for any eventuality as nuclear weapons have become the current currency of international power. The Chinese could free themselves from the Russians when they had nuclear weapons. France could follow an independent policy when it had a nuclear arsenal.

In conclusion, India in the 1980s is surrounded by nuclear weapon states, China and the Soviet Union in the North and the US nuclear fleet in the Indian Ocean with a nuclear base at Diego Garcia. Pakistan is about to achieve nuclear weapon capability, Pakistan was 20 years behind India in 1971-72 but it has galloped to a point which has placed it only five years behind India now.

China was behind India in the fifties but is now ahead by 7-10 years in nuclear weapons and missiles. It has deployed IRBMs and MRBMs at Nagchu in the Tibet region targeted towards Soviet Union. With any change in the Chinese perceptions they can be swung around to threaten vital Indian targets. Can India afford to be overtaken by two of its neighbours to such a significant extent in nuclear weapon technology? India cannot become a Switzerland or a Finland with its geography, size, population, resources and scientific and technical manpower. If we try to do it, this country will be broken up into a number of Switzerlands and Finlands.

India after Gandhiji has slid back and not gone ahead with the development of moral non-violent force. On January 30, 1948, just a few hours before Gandhiji was killed, Margaret Bourke-White, the American correspondent, asked Gandhiji, "How would you meet the atom bomb....with non-violence?" He replied: "I will not go underground ....I will not go into shelter. I will come out in the open and let the pilot see I have not a trace of ill-will against him. The pilot will not see our faces from his great height, I know. But the longing in our hearts — that he will not come to harm — would reach up to to him and his eyes would be opened."

Then probably guessing what was passing in his interviewer's mind, he added, "If those thousands who were done to death in Hiroshima, if they had died with that prayerful action — died openly with that prayer in their heart — their sacrifice would not have gone in vain". (*The Last Phase*, pp 808-9). If Gandhiji's statement is interpreted in modern parlance, he appears to have meant that if the philosophy of peaceful co-existence is accepted by all nations of the world, then the atom bomb will become irrelevant.

Are the Government of India, the political, academic, social and economic elites along with some percentage of the Indian population, ready to face the atom bomb with that prayer in their hearts under an open sky? If they are, then India will be in a position to renounce the atom bomb. If not, let us not make a joke of our shaky faith in the moral approach which can expose the patriotic Indian soldier to undeserved danger and death. Today we do not have any Gandhian to undertake the kind of healing task that the Mahatma undertook in Noakhali, in Assam and in riot-torn areas. The present-day self-appointed Gandhians write articles sitting in air-conditioned comfort in Delhi or elsewhere or some genuine ones trot on the dotted line without evolving themselves to meet the challenge of new and changing situations.

To sum up: Nuclear deterrence has worked after the dropping of the bomb on Hiroshima and Nagasaki and nuclear threats continue to be effective in asymmetric situations. The nuclear umbrella is neither, feasible nor reliable. It will be, in any case, cutting at the very root of non-alignment and Indian dignity. Possession of nuclear weapon by the state will not make it more authoritarian than it is with sophisticated or other conventional weapons. Possession of them has not made any change in the character and ideology of the UK, the USA, France, China or the USSR. The costs of production and development have been reduced with the development of technological infrastructure and the investments we have already made. The gap in costs between sophisticated conventional weapons and nuclear weapons have been narrowed. The conservative estimate for India is it that would not go beyond 4-5 per cent of the GNP, while 5 per cent is broadly accepted as legitimate defence expenditure in many countries. The expenditure of China and Pakistan is much more.

The nuclear option will strengthen our non-alignment and be a great support to the movement. It will not in any case lead to our being pushed around either by the Western countries or the Soviet Union or China.

So, the nuclear option is necessary to preserve our independence, independent decision-making power, independent foreign policy, to strengthen our non-alignment, dignity and honour. I am not opposed to Pakistan or any other nation going in for nuclear weapon option. Recently the London based International Institute of Strategic Studies has brought out a study by Prof. Kenneth Waltz: *The Spread of Nuclear Weapons: More may be Better:*

We have paid the price for neglect of our national defence in 1962 and have not got back the status which India had before that in world affairs. If we neglect our nuclear defence, the danger of fragmentation of our country of secessionism near our borders cannot be ruled out.

An African scholar on international affairs, Prof. Ali A. Mazrui, himself an Arab Muslim, in an article in the Journal of the Royal Institute of International Affairs muses, "Would India under non-Hindu leadership have produced satyagraha? The answer is probably No. Would India under non-Hindu leadership have invented non-alignment? The answer is ambivalent. Would India under Muslim leadership have pursued a nuclear status? The answer ir 'possibly sooner'." Let Indians ponder over this.

It is true that the Indian thought and culture spread by its inherent strength and not military might. Christianity, Islam and their culture spread through arms and territorial occupation. But we must not be oblivious to the sea-change that has taken place in the global environment through technology in thousands of years of human existence on earth. Radio, TV and Satellite are enabling the West to dominate the culture and values of the world. In this competitive world, we cannot preserve our unity or cultural integrity by closing our doors. Science and technology are the keys to power in the present. The issue has to be tackled at two levels. While we must intensively think out our civilisational problems to meet the restlessness of Indian society, it must be realised that our culture and identity will be overwhelmed if we do not have the strength and capacity to stand on our own.

Technology is value neutral. It depends on the values of the men who use it. Orientation to the use of technology has to be given by man. Our commitment to peace, friendship and cooperation in the world will rest on how we utilise the ultimate weapon that we possess. Indian history and tradition show that we are not an expansionist power. We do not believe in converting people. There is a story of an Indian delegate in the UN who told the Soviet delegate, the famous Andrei Vyshinsky, when he failed to get his proposals on disarmament accepted, to be patient, and try again. The Indian delegate added that may be, if not now, at some future date they would be accepted. Vyshinsky retorted it was all right for an Indian to say that since the Indians believed in rebirth and therefore if a thing did not succeed in this birth it might in a future birth. As a Marxist he was impatient.

We do not believe in imposing our ideology, our culture, our values on anyone. It is because of our inherent patience and our unwillingness to impose our views that Gandhiji evolved the slow and steady Satyagraha as preferred strategy in the liberation struggle. When we were at war in 1971, Nepal and Sri Lanka voted against us to stop war. They continue to vote year after year against us in respect of the Pakistani proposal for a South Asian nuclear weapon free zone. But we do not impose our views on them, unlike the way the US has been attempting to do on its allies on recognition of China, Moscow Olympics boycott, the Kampuchean issue or the Polish crisis, or as the Russians try to do on their neighbours or Communist parties in other countries. The Gandhian technique of non-violent struggle was to persuade your adversary to see that it was in his own interest to arrive at a settlement and not to take coercive action.

We have been attacked by bigger and smaller neighbouring countries and suffered. We had to go to liberate Bangladesh to send back the ten million refugees who had been pushed inside our border. The nuclear weapon in India's hands will never be used for offensive purposes but only for deterrence. It will be a symbol of resistance against the cultural, economic and political hegemonic offensive of advanced industrialised nations and foreign ideologies of all hues. The dividing line is not between making and not making atomic weapons but between having a nuclear arsenal and using it. That is also the spirit of Geneva Protocol of 1925 and the Biological Weapons Convention more recently concluded.

Of the five ostensible nuclear weapon powers two, China and the Soviet Union, have now subscribed to the Non-aligned Resolution that use and threat of use of nuclear weapons will be a violation of the UN Charter and a crime against humanity. The Western countries believe in fighting wars with nuclear weapons. They are not likely to use the weapons against the socialist bloc which can retaliate effectively but only against non-nuclear weapon countries. The Neutron Bomb is an ideal weapon for such use. If countries like India and Pakistan go nuclear, then the Western countries too will be compelled to accept a convention to ban nuclear weapons as they did in the case of bacteriological weapons.

The real problem is therefore how to reconcile the advancement of the cause of peace and denuclearising the whole world, not parts of it with simultaneous legitimisation of nuclear weapons which is what the so-called nuclear weapon free zones mean, with the plea for nuclear weapons for India. We are living in a lawless world. Even the law provides for the right of private defence. It is a grave offence if you murder somebody. But if you kill somebody in an attempt to save yourself from the killer, even the law does not consider it an offence but very legitimate. We all believe that the people should not have guns. But gun licences are given to protect life and property. In UP, Harijans are demanding guns to save themselves and the UP Government is considering it. Either the Government will have to take full responsibility to safeguard the life of the weaker sections or they will have no right to reject their demand. The underground gun market is already booming. If one is living in an area of dacoits, it becomes necessary for a person who may believe in total gun control also to carry a gun. There are not only five nuclear weapon countries. In fact all industrialised countries excepting a few rely on nuclear weapons for their defence, on nuclear weapon doctrines for their security. There are 35-40 such countries. Unless the nuclear and crypto nuclear powers destroy their nuclear weapon capabilities, they have no moral right to dictate to the non-nuclear nations to adjust to their world system and not to make nuclear weapons themselves. Similarly, the non-nuclear nations can consider all the industrialised nations which rely on nuclear weapons for their security as dacoits. To have themselves from such nuclear dacoits, the non-nuclear nations have to carry the nuclear gun.

We should not use the nuclear gun like the dacoit. The majority of those who have licensed weapons are law-abiding citizens who would prefer to have all guns taken away and have an orderly government which can enforce law and order. Till such a stage is reached it becomes necessary to have private arms for self-defence and exercise deterrence even while supporting the efforts to create a climate of law and order. So also in the current international environment, while we should strive hard towards banning and delegitimising nuclear weapons, India should also develop a nuclear arsenal without any further delay. (*Concluded*)

Saving Sick Small Industries

Rehabilitation of Small Sick Units

ODEYAR. D. HEGGADE

INDUSTRIAL sickness has been a growing menace in India for several years now. The problem has spread to all types of industries — large, medium and small-scale units. Industrial sickness is always reflected in high 'debt-equity ratio' of the units. If uncontrolled, the sickness may endanger the overall stability of our industrial economy due to high bankruptcy of plants, high unemployment of industrial workers, output loss, colossal wastage of resources invested, etc. All these likely adverse effects have far-reaching implications for future economic growth and social stability.

In the last decade (1970s) several measures have been initiated to hold the growing industrial sickness and eliminate it in a phased manner by a series of steps to rehabilitate sick units.

Industrial sickness in India is taken to refer to "concerns with liabilities substantially in excess of assets and suffering at the same time cash losses for three consecutive years" (P.C. Mahanti). Industrial sickness by and large represents the weak spots of our modern industrial economy. It has grown phenomenally over the last decade and spread fast to almost every part of the nation. Various high-power committees of Central and State Governments, banks and financial institutions have examined the causes of industrial sickness in this country. The general causes often cited are "incompetent and dishonest management, financial indiscipline, old and worn-out machines, technical obsolescence, demand constraints, labour relations problems and shortages of inputs". (*Commerce*, August 22, 1981).

A clearer picture can be obtained of the factors causing industrial sickness in terms of two broad categories — internal and external — drawn up by the workshop on reviving sick units sponsored by the FICCI some time back. It lists the internal factors as (a) choice of wrong location; (b) under-estimation of capital costs; (c) over-estimation of demand; (d) delay in implementing the project and escalation in costs; (e) faulty management accounting; (f) failure to introduce proper financial and cost control methods; (g) managerial deficiency and lack of proper plant maintenance and replacement. The external factors are enumerated as: (a) Government policies regarding production, prices and distribution; (b) inadequate availability of essential inputs including raw materials, power, transport, etc; (c) decline in public sector investment; (d) demand recession; (e) shortage of working capital; (f) adverse industrial relations; and (g) surplus labour.

The Statewise spread of industrial sickness among small-scale units in India, as at the end of December 1979, is given below. The total number of small-scale sick units was 20,841. Sickness among small-scale units has reached an all-time record.

Statewise number of sick small-scale units as at the end of December 1979: West Beagal 6,948; Maharashtra 2,763; Tamilnadu 955; Uttar Pradesh 1,152; Gujarat 856; Karnataka 1,039; Andhra Pradesh 1,323; Bihar 802; Rajasthan 323; Madhya Pradesh 525; Kerala 653; Haryana 225; Orissa 772; Punjab 403; Assam 1,045; Delhi 530; Pondicherry 3; Goa 75; Himachal Pradesh 51; Jammu and Kashmir 71; Manipur 186; Nagaland 3; Meghalaya 25; Tripura 70; Chandigarh 43. — Total 20,841 (Reply to unstarred question in Rajya Sabha, March 5, 1981).

It is seen that such sick units are predominant in States like West Bengal, Maharashtra, Uttar Pradesh, Karnataka, Andhra Pradesh and Assam, whereas Tamilnadu, Gujarat, Bihar, Orissa, Kerala, Madhya Pradesh and Punjab have between 400-900 units. In the rest of the States and Union Territories sickness among small-scale units has been small. Thus, it is very high in large and fairly developed States.

Due to the high level of industrial sickness among small-scale units, Rs. 262 crores was blocked in the form of credit outstanding by the end of December 1979. The number of small-scale sick units and credit outstanding at the end of June 1979 were 16,805 units and Rs. 181.75 crores. The

The author is Lecturer, Department of Economics, Mangalore University.

increase in both in a six-month period is indeed shocking.

The increasing sickness in the small-scale industrial sector calls for a comprehensive, speedy rehabilitation programme. The new strategy for rehabilitating sick units announced in the last week of June 1981 is unfortunately silent on the question of small-scale units. But the Reserve Bank of India has issued several new guidelines to banks to take necessary action for rehabilitating small-scale units (March 1980). They may be briefly stated as follows:

(1) The banks have been advised to strengthen their organisational structure at their regional offices and in large area concentrations of small-scale units to effectively monitor and implement the programmes of rehabilitation.

(2) Filing of returns about their performance to the respective lending bank by all small-scale units enjoying a total bank credit of Rs 10 lakhs and more is made compulsory. The lending banks have been asked to carefully watch their performance and initiate necessary remedial measures to health.

(3) Banks have also been advised to consider reduction in margin and rate of interest and rephase the repayment schedule or fund a portion of the working capital finance for recovery in a phased manner from out of future cash generation. "If any bank proposes to stipulate a level of margin or rate of interest lower than the levels prescribed by the Reserve Bank, it may refer such cases to the Reserve Bank with necessary data for considering grant of exemption."

As a result of the above guidelines, various "State-level Inter-Institutional Committees under the convenorship of regional heads of Department of Banking Operations and Development of the Reserve Bank have been or are being set up in selected centres. Representatives of the Industrial Development Bank of India, State financial corporations, commercial banks, State Governments, etc., are the members of these committees. Beside providing a useful forum for exchange of information and discussion on the problems faced by small and medium industrial units and small entrepreneurs, the committees deal with problems relating to co-ordination between banks and financial institutions, provision of adequate infrastructual facilities to industrial units and grant of credit to such units."

The RBI guidelines have been in effect for more than a year, but not much headway has been made either in holding the growing menace of sickness or in rehabilitating a large number of sick units. This is so because the guidelines provide basically for financial concessions, extension and rephasing of recovery of loans, etc. Mere financial assistance and concessions do not always bring about discipline and efficiency in management. Therefore, there is need for evolving a more comprehensive rehabilitation programme for self-sustained growth of small-scale industries.

In some official circles of the Union and State Government it has been suggested in recent times that all small sick units having high debt-equity ratio for more than three years should be exempted from payment of bonus and minimum wages. But it is forgotten that any such policy will reduce labour welfare and lead to labour unrest. Appro- 'nursability' strategy should be developed on pragmatic grounds and implemented by involving all the concerned agencies.

About the concept of 'nursability' it has been emphasised that mere administration of doses of financial help by financing institutions does not solve the problem. The institution has not only to put in finance in appropriate doses during critical situations but also suggest the removal of inefficient employees from the rolls, apart from suggesting necessary changes in production planning, material control, marketing perference and such other matters. It has been noted that concessions alone will not solve the problems; close watch on day-to-day working-capital management and fixing up of priorities in the matter of payment are essential.

Care should be taken to avoid establishment of new small-scale units without proper project planning, cent per cent feasibility and a high degree of social relevance. This can be done efficiently at the Small-scale Industries Department and funding bank level. To do this, some type of responsibility should be shifted to both these agencies; only then it will be possible to avoid proliferation of small units which may become defunct in a very short time.

In the Sixth Plan, it is intended to implement a scheme to "improve and restore the borrowing capacity of small-scale units through provision of margin money, with other inputs and active involvement of financial institutions ... to deal effectively with the problem of sickness."

The foregoing analysis shows the need for comprehensive rehabilitation programme. Such a strategy is indispensable to protect employment levels in such sick units, to ensure the wise utilisation of scarce productive resources, to promote small-scale production and dispersal of industrial activities. Therefore all possible efforts should be made by the Government, banks and the managements of the small units to tackle the problem of sickness more efficiently.

A large number of small-scale industrial units are located in and around the large cities as well as medium-size towns like district headquarters. A more healthy and highly productive agglomeration of small-scale units will be beneficial. This will help to some extent the efforts to scale down the widening rural-urban disparities in growth. ☐

Samora Machel : Symbol of New Era

BAREN RAY

THE five-day official visit by a 40-member inter-ministerial delegation led by President Samora Moises Machel and the Indo-Mozambican talks in New Delhi leading to a number of mutual cooperation agreements are a major international development that will have significant long-term effect not only on bilateral relations but on the larger geo-political situation in the entire Indian Ocean region.

Mozambique is one of the frontline states in Southern Africa, an active member of the non-aligned movement, a country pursuing the path of socialist orientation following a successful though protracted revolutionary armed struggle — a people's democratic revolution based on a worker-peasant alliance. The FRELIMO — Mozambican Liberation Front — will be celebrating in a couple of months the twentieth anniversary of its foundation in 1962. One of the oldest colonies of the European powers in the Afro-Asian world — Mozambique had suffered more than five centuries of the most ruthless Portuguese colonial rule — whose population had been left the most backward, it was amazing how this comparatively young movement not only achieved complete success in its difficult national liberation struggle, but along with it laid down the basis of an advanced egalitarian democratic social order.

Among the frontline states, together with Angola, it is one of the major sources of support for the liberation movements in Southern Africa — in Namibia and in South Africa itself — against the fascist apartheid regime, and in turn it is among the major targets of constant and continuing South African military raids and aggression across its frontier (on its roads, railways, bridges, installations, etc.), pursued with the objective of destabilising the progressive regime and retarding its economic development. But today this aggression is not by the South African apartheid regime alone; the latter has the full political and military backing of the Reagan Administration. As recently as a month ago the US government supplied massive quantities of sophisticated military hardware to South Africa.

It was these escalating attacks on its territory by the South African regime that prompted the People's Republic of Mozambique last year to seek military support from the Soviet Union on the basis of the Treaty of Friendship and Cooperation signed in March 1977. Following this, Mozambique had an effective Soviet naval presence outside Mapto harbour with on-board helicopter and air force support to repel South African air attacks or raids by saboteurs air-dropped on its territory. Such is the extent of confrontation the Reagan Administration has imposed against progressive states by using the fascist racist regime as its cat's-paw. In the South of Africa it is the apartheid state, against the Arab countries it is Israel, coordinating with its new Rapid Deployment Force stationed in a number of countries.

The escalation of conflict in the South of Africa is part of the Reagan Administration's global strategy of increasing military build-up all over the world, of challenging the forces of national liberation and independence, of subjecting them to all kinds of pressures, threats and blackmail. Directly, it fits in with the USA's own programme of massive military concentration in the Indian Ocean area. Mozambique which has an almost 2000-mile-long coastline washed by the Ocean is thus doubly threatened. Against this background of an aggravating international situation, it is imperative that the member-states of the non-aligned movement begin some joint moves to work out a collective response. The beginning of many-faceted cooperation between Mozambique and India, the latter not only a weighty member of the non-aligned bloc but the major power in the Indian Ocean region, is a most significant international development that can tilt the balance in favour of peace, stability and security in the region.

There was V.K. Krishna Menon's famous characterisation of colonialism as permanent aggression. Bringing the analogy up to date, the hated apartheid system in South Africa and the ever-mounting resistance it arouses including organised armed struggle, was rightly described by Prime Minister Indira Gandhi as a form of "civil war". This "civil war", however, is not an internal matter affecting South Africa alone, it impinges directly not only on the independence and territorial integrity of the frontline states but even on the peace and security of countries bordering the Indian Ocean. The question therefore is one of rendering all-round material and military assistance to the freedom fighters in this very special civil war, and particularly to those frontline states which are being sucked into the vortex of the conflict.

It is not merely a matter of abiding moral sympathy and solidarity; India must offer this in pursuit of her national self-interest, in defence of peace and security in our strategic environment. India must render such assistance to the very best of her ability. While bilateral economic cooperation is bound to be helpful to the Indian economy too in the long run, the objective of helping Mozambique overcome the destruction inflicted on her and enabling her to rapidly build her economy, for which assistance is sought from India, is in India's own immediate political and strategic interest.

The beginning of this cooperation is therefore to

The author was till recently Deputy Secretary-General of the Afro-Asian People's Solidarity Organisation (AAPSO).

be welcomed by all freedom-loving and democratic forces in the country, and it may be hoped that this is the beginning of such cooperation with other states which together will constitute the basis of multilateral cooperation among a nucleus group of states acting in harmony in pursuit of common objectives. The much-sought-after South-South cooperation also can emerge from such all-round cooperation and joint endeavour by like-minded states.

The cementing of close ties of friendship and cooperation between our two countries is not only for channelling assistance from India to Mozambique; there is much that India can learn from Mozambique's short but glorious freedom struggle. Under Portuguese colonialism, the African population had not only been kept undeveloped, illiterate, poor and backward, they were brutalised and subjected to conditions of forced labour and near-slavery. There were numerous ethnic and tribal differences fragmenting the population in addition to the terror and rapine and cruel repression by the Portuguese.

It was against this background that the FRELIMO was founded on June 15, 1962, to unite and mobilise the masses. They began by trying to conduct political struggles, but it was soon found that under conditions of Portuguese colonialism and its alliance with the fascist apartheid state in South Africa there was no scope for conducting the struggle by peaceful means. The FRELIMO began to prepare for a protracted armed struggle for the total liberation of the country.

After adequate preparations both by way of mobilising the people and creating the necessary logistical and practical conditions (at a time when there was a total of only 200 cadres trained for armed combat against the 30,000-strong Portuguese army), the struggle was finally launched on September 25, 1964. The dramatic measure of FRELIMO's achievements in the following years was the fact that by 1968, it was able to hold its second congress on liberated territory inside Mozambique. The enemy was powerless to prevent the congress or interfere with its proceedings though two months before it was held, FRELIMO had announced that it would take place.

But as the struggle expanded, a profound crisis hit the organisation in the years 1966-69, involving a fierce struggle between two political lines. The victory of the popular revolutionary line resulted in the struggle for national independence being converted into a struggle against all forms of exploitation. This involved a definition of the enemy in terms of a system not a people, so that targets were identified not as the whites or even as colonialism, but as colonial capitalism and traditional feudalism.

In the liberated zones it was soon realised that the mere elimination of the Portuguese colonial presence left unanswered the question of what kind of society should be constructed in its place. Opportunist and ambitious elements inside FRELIMO, using a combination of racist and traditionalist arguments, attempted to establish personal power bases in the liberated zones, subjecting the mass of

MARTYR'S FULFILMENT

Speaking of Samora Machel's life and of the Mozambican Revolution, one must mention the name of Josina Machel, his first wife and herself a leader in the struggle. She was the Head of the women's detachment of the Armed Forces as well as Director of the Section of Social Affairs and of the Feminine Section of the Department of Foreign Affairs. She was killed in battle on April 7, 1973 — the date was later declared Mozambican Women's Day. Of her people's struggle and of the impending victory. which was already beginning to be visible on the horizon, she had earlier written the following, perhaps anticipating her own end. We print these two poems as giving an insight into the temper of the Mozambican Revolution as well as to the character of its leading personalities.

This is the Moment

This is the moment we were waiting for
Our guns are light in our hands,
the motives and objectives of the struggle
are clear in our minds.
The blood shed by our heroes
makes us sad, but resolute.
This is the price of our liberty.
We keep them close to our hearts
and from their examples the new generations
— revolutionary generations —
are now surging to life.
We see bitter sufferings along the road
but we also see
our children running free
and our homeland, no longer plundered.
This is the moment to be ready
and firm.
This is the moment to give ourselves totally
to the Revolution. — *Josina Machel*

On her death, Samora Machel had written:

Josina — You Are Not Dead

Josina, you are not dead, because we have assumed your responsibilities, and they live in us.

You have not died, for the causes you defended have become totally our heritage.

You are not beside us, but the gun and the pack you left, your work tools, are a part of our load.

The blood you shed is only a tiny drop in the cascade we have already given and will still have to give.

The earth must be nourished, and the more fertile it is, the better the trees grow, the greater the shade they give, the sweeter their fruits.

I will make a spade in your memory, to turn over the earth enriched with your sacrifice. And new fruits will grow.

The Revolution renews itself from its best and most beloved children.

This is the meaning of your sacrifice: it will be a living example, to be followed.

My happiness is that, as a patriot and as a woman, you died doubly free in this hour in which the new power and the new woman are arising.

In your last moments, you begged the doctors to forgive you for not being able to help them.

The way you accepted sacrifice is a source of inspiration and courage.

When a comrade so completely adopts the new values, she gains our hearts and becomes our banner:

And so, more than wife, for me you were my sister, my friend, my comrade-in-arm.

How can we weep for a comrade, except by grasping the fallen gun and continuing the fight?

My tears flow from the same source that gave life to our love, our revolutionary will and life.

Thus these tears are both a token of love and an oath to fight.

The flowers that fall from the tree must prepare the earth so that more flowers, and more beautiful ones, bloom the next season.

Your life continues in those who continue the Revolution. — *Samora M. Machel* the people to new forms of domination and exploitation. It was in opposition to this reactionary group that the FRELIMO Central Committee, led first by the Founder-President of the organisation, Eduardo Mondlane, and following his assassination in January 1969, by his successor Samora Machel, now President of the Republic, developed the distinctive FRELIMO approach to popular mobilisation and state construction. The FRELIMO went beyond eliminating the colonial state apparatus, based on a system of magistrates, forced labour and taxes, to destory also the traditional tribal structures. The struggle was broadened to include economic emancipation, the liberation of women and an end to subjugation of the young.

This was a brilliant period in African and world political history, the sudden flowering in the bush and forests of northern Mozambique, amongst people kept for centuries in ignorance, of the most advanced and revolutionary ideas of mankind. Based on its experience of creating a new consciousness as it created new institutions of popular rule in the liberated zones, FRELIMO developed a clear view of the principles which should govern state development when the whole of Mozambique was liberated.

By 1974, FRELIMO had liberated large parts of the country. The hammer blows of the liberation movements in Angola, Mozambique and Guinea-Bissau also hastened and facilitated the work of the progressive forces in Portugal itself to bring to an end the 50-year-old Salazar-Caetano fascist rule. FRELIMO then was able practically to take over the whole country till full formal independence was achieved on June 25, 1975.

President Samora Machel was born in the Gaza province in southern Mozambique in 1933, and he learnt the lessons of colonial oppression quite early. His own grandfather had been wounded in earlier resistance to Portuguese occupation. His eldest brother was recruited for work in the South African gold mines and did not return. In 1950, land in Gaza area was seized by the colonialists to make way for a fresh wave of white settlers and the Africans were moved to infertile areas, their villages were destroyed without compensation. Samora Machel began his education at a mission school but found further studies blocked, and it was only after he started work that he was able to proceed with his secondary education, paying the fees out of his wages. As the resistance movement developed, Samora Machel left Mozambique in 1962, immediately underwent military training, and was in the army when FRELIMO opened its assault in 1964. He had risen to the rank of Commander of the People's Army when he was elected President of FRELIMO in 1969.☐ *(April 11)*

ITALY

The Weary Path to Socialism

BELA BUTALIA

On March 18, the Italian Communist Party newspaper, *L'unita*, published a letter purporting to be authentic as it bore the file number of the Italian Home Ministry. The letter, which turned out to be false, had given the names of two Democrat Christian (DC) politicians, as the key men who had approached jailed Mafia boss, Rafaele Cutolo, to solicit him to mediate for the release of their kidnapped colleague, Ciro Cirillo.

Cirillo, till recently the regional

further proof had come to light. No wonder when the Italian Communists received this letter, brought to the paper by party member and correspondent Marina Maresca, there was little reason to doubt its authencity. Its falseness cost the party considerable loss of face, as well as the resignation of the paper's editor, newly appointed Claudio Petruccioli who resigned after owning complete responsibility for the error. The correspondent, who was suspended from the

Unity Government formed by the two majority parties, the Democrat Christians and the Communists. The recent uproar has been caused by the very ambiguous circumstances leading to the release of Cirillo last year (while Aldo Moro was murdered after nine months of captivity and as a result of the intransigent attitude of the two majority parties towards negotiations for his release). Again, both times, Red Brigade terrorists were involved.

stoop to negotiations with the terrorists when it came to Ciro Cirillo, while for the release of Aldo Moro there had been an intransigent attitude of refusal? Then again, who is afraid of the Italian Communist Party, which after all has demonstrated its independent stance as regards Moscow, by condemning the Soviet Union in the Polish crisis as well as not accepting its 'model' of socialism? Even the concept of the 'dictatorship of the proletariat' has been reversed, and the party has enlarged its revolutionary base to include white-collar workers and public-sector employees.

The embarrassment caused to the party has also resulted in confusion within the rank and file: Accusations were hurled that it was the doing of Berlinguer's rival, Giorgo Napolitano, who heads the Communist group in the Senate. The fact that Napolitano has been replaced by Perna may strengthen this charge.

As though to complicate issues, a few days after the publication of the false letter, another letter reached *L'unita* office, written by noted criminologist, neo-fascist and Rome tribunal psychiatric expert, Aldo Semerari. Semerari claimed to have been the author of the false letter, and mentioned a secret meeting he had with Mafia boss Cutolo before taking the initiative of writing the letter. The following day, Semerari's decapitated body was found in the railway station of Ottaviani, a small village near Naples, noted fief of boss Cutolo. To lend weight to the theory of a Mafia revenge killing, the head was wrapped in a plastic bag, and the letters 'LZ' (Libera Fratellanza or Free Brotherhood) found near it, in true Mafia style. Semerari's woman friend, Maria Fiorella Carrara, was found dead, in her Rome penthouse with a suicide letter mentioning her fear of facing the fate of Semerari.

Investigations revealed that Semerari, just before being killed, had a meeting with Cutolo's rival, a certain Pupetta Maresca, to whom Semerari owed allegiance, though he held Cutolo in great admiration. What then is the connection between a Mafia feud and the Italian Communist Party?

Though stories of Mafia (Camorra as it is locally known around Naples) killings and feuds are part and parcel of Italian political and cultural life — no political party is absolutely immune to infiltration of small-time 'mafiosi'—the Italian Communist Party is generally reputed to have cleaner hands than other parties. Besides, even if occasionally entangled in minor scandals involving some party member or the other having contacts with the Mafia, the Communists have never been taken to task so heavily before. Though dedicated contemporary writers have based their novels on possible Mafia infiltration of the party (for instance, Leonardo Sciascia's *Il Contesto* and *La Palma va al Nord*'), there is no concrete evidence for their suspicions.

The Italian press has spoken of the involvement of Red Brigades, the fascists, the secret Masonic Lodge P2, the Italian secret services as well as certain protected clients of the Democrat Christian Party as probable culprits in the war of dossiers raging in Italy currently, but nothing has been proved. Some things seem to have occurred without any ample explanation being given to the public. It is known that Italian secret services belonging to both the civil services (SISDE) and the military intelligence (SISME) are known to have visited Mafia boss Cutolo in jail. Though the Home Ministry has averred that these visits were for routine enquiries, there is speculation as to why the military intelligence need intervene — military intelligence intervenes only when it is a question of defence security. Scamarcio, Under-Secretary for State in the Ministry of Justice and a member of the Socialist Party, has declared that negotiations for the liberation of Ciro Cirillo "have witnessed the participation of secret services linked up with particular interests of the Democrat Christians themselves". However, though this time the game is being played entirely in the parlours of the Democrat Christians, no opportunity is being lost to make the opposition Party, that is, the Communist Party once again the victim in the struggle for power, as in early 1978. ☐

Time to Recognise Western Sahara

A SPECIAL CORRESPONDENT

THE recent developments over the Western Sahara issue have added a new dimension to the entire dispute.

In the beginning of February this year the seven-nation "Implementation Committee", set up by the Organisation of African Unity at the 18th OAU summit in Nairobi last June to help prepare the ground for negotiations between Morocco (which is in occupation of the former Spanish colony for the past six and a half years) and the Polisario Front (a genuine people's movement for total decolonisation and liberation of the 2,60,000 square kilometre mineral-rich territory in North-West Africa) to (i) effect a ceasefire and (ii) hold a referendum on the question of self-determination of the 1,50,000 populace (according to conservative estimates), declared in Nairobi that its efforts to convince Morocco of the need for direct negotiations with the Polisario Front has failed.

This was a blow to all peace-loving elements in the African continent and the world at large (including India) who are eager to see a peaceful negotiated settlement of the Western Sahara problem which has defied such a solution since it cropped up with the withdrawal of the Spanish troops from the area and their immediate replacement by the Moroccan forces in 1975.

In less than a fortnight since this declaration by the "Implementation Committee" (comprising representatives of Kenya, Nigeria, Sudan, Tanzania, Guinea, Sierra Leone and Mali) the Government of the Sahrawi Arab Democratic Republic (SADR), established as the sovereign regime of the Sahrawi people (as the inhabitants of Western Sahara are popularly called), received an official invitation from the OAU Secretary-General to attend the Organisation's 38th Ministerial Council meeting of Foreign Ministers at Addis Ababa (February 22-28, 1982). Accordingly, a 12-member SADR delegation headed by Hakim Brahim, the Sahrawi Foreign Minister, attended the meeting. On February 25, the SADR flag was officially hoisted at the OAU headquarters along with the flags of the 50 other members.

It needs to be mentioned that the SADR's admis-

(and not political) matter concerning neither the OAU summit nor the "Implementation Committee" which had been entrusted with the question of decolonisation of Western Sahara.

Thereafter, the OAU Secretary-General issued in due course a notification to the effect that the SADR had been admitted into the OAU as the Organisation's 51st member. The SADR Government received the notification (as is the procedure according to the OAU Charter's Article 28) at the end of summer last year. However, since the SADR Government sincerely wanted the efforts of the "Implementation Committee" for the Morocco-Polisario negotiations to succeed it displayed rare maturity and desisted from publicising the OAU notification granting membership to the SADR. As a result, it was only after several months that the OAU decision on this score became public in the normal course of events with the SADR's natural response to the official invitation for attending the OAU Ministerial Council meeting at Addis Ababa.

The reaction from Morocco to this development was along expected lines. It was Morocco which had frustrated the moves of the OAU "Implementation Committee" for negotiations with the Polisario Front on the ground that it had never recognised the Front (it desired negotiations with Algeria which it alleged was just propping up the Front); and this even after it has been conclusively proved that 90 per cent of the territory of Western Sahara is under the Polisario Front's control (only a small phosphate rich "triangle" with the capital El Aiyun, the phosphate mining area of Bou Craa and the religious centre of Smara forming its three cones is where the Moroccan troops are now confined. So it was quite in conformity with what had been anticipated that Morocco walked out of the Addis Ababa meeting in protest against the SADR's presence. The fact that it was followed by 16 countries — Senegal, Gambia, Tunisia, Guinea, Ivory Coast, Sudan, Somalia, Djibouti, Comoros, Mauritius, Zaire, Gabon, Central African Republic, Cameroon, Niger and Equatorial Guinea — in the walk out was not much of a surprise either. But the Addis Ababa with all the means at its disposal to divide the OAU and bring about a split within its ranks on this question. Economic pressure is being brought to bear upon a large number of African states which in their primary stages of development are quite vulnerable particularly to threats of food aid cut. Indeed this is a form of US interference in the affairs of Africa. And coupled with this have come reports of direct American intervention in Western Sahara: already US military advisers and experts are in the "triangle" (linking Smara, El Aiyun, Bou Craa—popularly known as the "triangle of shame" among the Sahrawi people) helping the Moroccans to fortify the wall dividing the triangle from the rest of the territory with radars and other sophisticated military equipment. But still the wall and the triangle are being continually subjected to bombardments and military operations on the part of the Polisario freedom-fighters. The magnitude and regularity of these attacks are presently on the rise.

While this US military intervention in Western Sahara alongside American interference in Africa in general is a matter of grave concern, it is also becoming clear that the Reagan-Haig approach to such issues has failed to yield the desired result. Indeed if the reports from Zimbabwe are to believed, the OAU Labour Ministers' Conference held in Salisbury on April 5-6, found only eight countries joining Morocco in the walk-out. This in itself is a testimony to the sharp dwindling in the number of Morocco's staunch supporters. Also noteworthy is the postponement of the Dakar meeting of OAU Information Ministers in mid-March because there was no quorum due to the non-participation of most of the OAU member-states in solidarity with the SADR whose representatives were not allowed to come to the meet by the host country, Senegal, which still remains one of the few trusted allies of Morocco.

In this context one has to realise the importance of several major Western countries — France, Greece, Italy, FRG, UK, Sweden, Switzerland, Belgium — permitting the Polisario Front to open either its official bureau or its information office in their respective capitals. Particular significance is attached to the manner in which the Mitterand Government of France allowed the Polisario office to be set up in Paris: the decision in this regard was announced precisely when Moroccan King Hassan II was in the French capital.

So far the SADR Government has been recognised by as many as 50 countries, the bulk of which are non-aligned countries including some with socialist orientation like Cuba, Vietnam, North Korea, Ethiopia, Angola, Mozambique. But the USSR and the East European socialist countries have yet to accord recognition to the Sahrawi Republic. The list of the 50 countries which have forged diplomatic links with the SADR is as follows: *Africa* — Madagascar, Burundi, Algeria, Benin, Angola, Mozambique, Guinea-Bissau, Togo, Rwanda, Seychelles, Congo, Sao Tome & Principe, Tanzania, Ethiopia, Cape Verde, Ghana, Uganda, Zambia, Lesotho, Sierra Leone, Libya, Swaziland, Zimbabwe, Chad, Mali, Botswana; *Latin America* — Panama, Granada, Guyana, Dominique, Saint Lucia, Jamaica, Nicaragua, Mexico, Cuba, Costa Rica; *Asia* — Democratic People's Republic of Korea (North Korea), People's Democratic Republic of Yemen (South Yemen), Socialist Republic of Vietnam, Kampuchea, Laos, Afghanistan, Iran, Syria; *Oceania* — Vanuatu, Papua New Guinea, Solomon Islands, Kiribati, Nauru, Tuvalu.

It is in this setting that a three-member delegation of the SADR headed by Sadik-Bachir Malainin (member of Polit-Bureau and head of the Asia-Oceania Department of the Polisario Front; as well as SADR Ambassador to Iran) recently visited India and held discussions with senior Indian officials of the External Affairs Ministry on the latest situation in Western Sahara. Following the talks, Malainin had this to say: "The Indian officials have expressed sympathy with the cause of our people. We take this opportunity to thank India for its position of support, in international organisations, especially in the UN and the non-aligned movement, to the legitimate rights of the Sahrawi people for self-determination and independence.

After the SADR's admission into the OAU, the Chairman of the OAU Ministerial Council meeting at Addis Ababa had at the concluding session of the meeting on February 28 called upon all countries of the world to recognise the SADR. The SADR people and Government as well as the OAU are, therefore, sincerely hoping to see India accord due recognition to the SADR as a logical culmination of its consistent support to the Sahrawi people's legitimate rights and struggle for self-determination and independence."

India's recognition of the SADR brooks no delay especially when it had been earlier conveyed through official channels to the SADR representatives that such recognition would be forthcoming as soon as the issue was settled at the regional level, that is, the OAU. Now that the OAU has admitted the SADR into its fold the issue has been settled once and for all. If India could recognise the PLO when Palestinians have yet to get back their territory, there is no reason why the SADR and the Polisario Front (which has liberated 90 per cent of the territory of Western Sahara) should continue to await Indian recognition. In fact, since February, 1981 ambassadors of five countries—Mexico, Cuba, Nicaragua, Vietnam and Iran—have presented their credentials to the SADR's Head of State Mohamed Abdel Aziz at the liberated town of Hausa in Western Sahara (which is the headquarters of the Polisario and the provisional capital of the SADR), a town which this correspondent visited during a trip to Western Sahara in January last year.

India may be dragging its feet on the subject because of the apprehension of Morocco's reaction to recognition of the SADR. But notwithstanding all its threats, Morocco has not yet snapped ties with the 50 countries which recognised the SADR. The SADR, on its part, not only enjoys the backing of a majority of the OAU member-states, but is also keen to see Morocco's return to the OAU so as to facilitate the process of Morocco-Polisario negotiations for a ceasefire and referendum in Western Sahara. The Polisario and the SADR have all along advocated such a referendum in the territory, but Morocco doggedly opposed the proposal before accepting it at the Nairobi OAU summit last year only to torpedo it at a later stage.

When the SADR and the Polisario Front are striving their best to fight for peace and stabilise the situation in the region in contrast to the Moroccan plans for war and destabilisation at the behest of the US (which is providing massive armaments to Rabat while Morocco is eager to provide RDF facilities to Washington, a suggestion made during US Secretary of State Alexander Haig's recent visit to Rabat), India needs to resolutely stand by the side of the forces of peace and stability in North-West Africa. This assumes added significance in the wake of active attempts on the part of the Reagan Administration to prevent Libya from hosting the forthcoming OAU summit at Tripoli in June this year and to break the OAU's united as well as cohesive entity.

If France being a NATO member can let the Polisario Front open an office in Paris, India as a leading figure in the non-aligned movement can and must go a step forward in recognising the SADR now. At a time when the American shadow is looming large over Africa, such a step by India will earn admiration of the non-aligned world as yet another gesture in support of the cause of peace, non-alignment, independence as well as self-reliance of peoples, and also serve as a token of solidarity with the OAU which is facing a Washington-inspired diversion within its ranks. ☐ *(April 14)*

COMMUNICATION

CPI Gen Secretary on Magarwara Massacre

AN article (by Amiya Rao) on Magarwara massacre in Unnao district of women belonging to Tata Chemical Factory appeared in *Mainstream* (April 3, 1982), in which some incorrect facts appeared about me and our Party. I could read this issue only on April 7 after I returned from Varanasi.

In order to put the record straight, I am giving below what happened:

A massacre of workers belonging to Rallis-India (a Tata concern) by the police took place on January 3, 1982, after dark when the workers were on a sit-in strike over their very just demands. When I was on my tour of UP in connection with fund collection for the Party Congress, I went there on January 13 along with Comrade Sarjoo Pande, Secretary of the CPI State Council and Comarde Bhikhalal, leader of our Party group in the State Assembly. We took along with us a number of correspondents from Lucknow to see that enough publicity was given to this ghastly incident.

When we went to visit the factory, it was closed. We were not allowed to see the premises where the massacre took place. The police also blocked the roads leading to some villages beyond the factory. But we went, along with correspondents, to Dayalkhera, a village near the factory where the police had launched repression after the firing. We visited the entire village, noted down the statements of people who were beaten up and whose family members had been shot by the police. We held a meeting in which we promised them that this issue would be taken up by us. Our Party units in both the U.P. Assembly and Council, along with other opposition parties, raised the issue on the floor of the legislature and created a furore. The correspondents who accompanied us had done their duty and had given enough publicity in the Lucknow papers.

Later, a detailed report of the incident, describing the atrocities, was circulated by our Central News Service which was published in *New Age* and other journals of our Party, as well as by *Patriot* daily.

I would request you to publish this letter of mine in your journal so that your readers may know the truth.

C. Rajeswara Rao
General Secretary,
Communist Party of India
New Delhi

Protest Against Forest Bill

WE are shocked to learn about the proposed new forest bill (the Indian Forest Bill, 1980) of the Government of India. The stated objective of the bill is the protection of the fast depleting forests of our country.

In effect, the new bill (a) empowers the Government to declare any area as forest area and thus bring it under the purview of this bill; (b) establishes the authority and control of the forest official over not only reserved forests and protected forests but also village forests and private plots of tribals; (c) lists a number of acts, which include the customary practices of the tribal communities, as offences: the comprehensive list of offences includes even gathering flowers and leaves of grass; (d) makes all such offences cognizable and punishable with imprisonment up to six months and/or a fine up to Rs. 500; (e) gives forest officials magisterial powers and authorises them to make arrests even without warrant; (f) makes all acts of forest officials immune to challenge in a court of law unless given permission by the authorities.

The far-reaching implications of the bill to our economy, environment, and polity can be summed up as follows:

1. It denies any direct role to the tribals in forest management; instead, it establishes the mono-

poly of the state and of the private interests in forest economy, thus destroying the democratic character of tribal economy.

2. It is likely to lead to further destruction of our forests and environment as it gives vast powers to the Government to decide the nature and extent of plantation and its exploitation of the forests which will only result in further indiscriminate commercialisation which is the chief reason for the deforestation in the last thirtyfive years.

3. It deprives the tribals not only of their communal rights but also of their normal democratic rights and reduces them to a state of total dependence on the forest officials.

4. It violates the letter and spirit of the Constitution as it threatens the tribals' fundamental rights, goes against the Directive Principles, violates the principle of judiciary independence from executive, and abrogates state autonomy.

5. It seeks to create a permanent schism between the tribal communities and the rest of India, thus further threatening the social fabric of our society.

In fact, the manner in which the Government has brought the bill has established its undemocratic character. No representative of tribal organisations or communities was ever involved in the process of preparing the bill. Further, their opinion is not being sought on a bill so significantly and harmfully affecting their lives. Only a few cyclostyled copies of the bill are being circulated in very select circles.

This clandestine manner coupled with the repression now going on against various tribal-based movements in Singhbhum, Jharkhand, Adilabad, Bastar and parts of the North-Eastern Region makes it clear that the Government of India is on an undemocratic course towards a deprived section of the population.

We, the undersigned, express our unambiguous protest against the introduction of such a bill. We appeal to democratic sections all over the country to build public pressure for (1) the immediate withdrawal of the bill, and (2) the involvement of the representatives of tribal communities and organisations in the process of evolution of forest policy.

COATS' BULGING POCKETS : AT WHOSE COST?

ONE of Scotland's largest multinationals, the thread production company Coats Patons, is guilty of de-industrialisation at home and exploitation in the Third World, according to a new report from the pressure group, Scottish Education and Action for Development.

Coats started over a century ago in a room and a kitchen in Paisley near Glasgow, and now operates in over 30 countries manufacturing about a fifth of all the thread sold in the world. In 1960 the Paisley workforce was 14,000: today the figure has declined to 1,400 and there are plans to cut a further 700 jobs over the next two years. At the same time the company's activities in Asia and South America have been expanding, so that for example the associated Madura Coats company now employs 22,000 people in South India.

The main reason for this trend is that the rate of return on investment in the Third World is nearly three times as profitable as in the UK. In 1980 the 35 per cent of Coats Patons assets in the UK produced only 20 per cent of profits, while the quarter of the company's assets in the southern hemisphere yielded almost half of total profits. Recently Coats Patons released figures which showed that labour costs in India were 13 per cent of those in Britain, while comparative costs in the Philippines and Indonesia were even lower. In the future, as British manufacturing shrinks, the company intends to import more thread produced abroad for sale in this country (UK).

The report's author, Alan Sinclair, spent two months last year in India investigating the activities of Madura Coats and alleges that working conditions there are dangerous. Health and safety records are not kept but even the firm's Personnel Manager, Mr. P.G. Menon, admitted that conditions were 'very poor' compared to similar plants in Europe. The three main trade unions are accused of corruption, largely because of management's policy of giving union officials a certain number of jobs to sell at their discretion. Indians anxious for a job have been known to pay the equivalent of three years' wages in return for work.

Although the wages of Madura Coats' shop-floor workers are reasonable in comparison with other Indian industries, the differentials between junior and senior employees are immense. The boss earns well over a hundred times as much as trainees, a ratio at least five times worse than in Brritain. The chasm is widened by the existence of special walled-off compounds reserved for senior management, containing air-conditioned bungalows with servants, chauffeur-driven cars, gardens and a shared swimming pool.

In 1980-81 Madura Coats is estimated to have repatriated £ 500,000 profits to Coats Patons in Scotland — a sum equivalent to half of Oxfam's total relief effort in India over the same period.

Rob Edwards in New Statesman, *March 12, 1982*

We have accepted in India as our objective a socialist pattern of society. That means not only economic organisation but something deeper which involves a way of thinking and living. The acquisitive society, whose chief aim is profit-making, not only brings conflict in its train but is opposed to the basic urge of modern man for social justice. Socialism is based on the growth of material resources as well as social justice and a co-operative method of working.

POLITICAL NOTEBOOK

Poll Antics

THE credibility of the "non-Communist Opposition", never very high, has tumbled down to a new low in recent days, thanks chiefly to the Chandigarh unity convention farce of two-and-a-quarter parties and the octogenarian Lok Dal chieftain's astounding acrobatics which have left the Janata and Congress-S Presidents looking quite foolish. All the mighty thunder about shaping a national alternative to the Congress-I has dwindled into the whimper of a whipped cur.

The unity convention was a misadventure from the start. In the Janata ranks there were misgivings, but Chandra Shekhar would not face the facts. In the Congress-S too there were rumblings but Sharad Pawar, cocksure in new-found company, paid no heed. And the three musketeers from the Lok Dal, heroes for a brief while, were seen as the cement that would make the unity mansion hold together. No one seemed to see the difference between cement and sand.

No one, that is, except Charan Singh. Apart from initiating and backing out of the unity move earlier, he decided to deal with the defiant trio: nine-day political *sanyas*, suspension of the "rebels", revocation of the suspension on the basis of unconditional surrender buttressed by a statement pledging loyalty to the leader. Then, two voices: George Fernandes, the irrepressible, talking of negotiations with all parties for electoral adjustments, including the Janata and the Congress-S, and Secretary Rabi Ray rejecting talks with the two parties without any qualification.

In between, an understanding between the Bharatiya Janata Party alias RSS and Charan Singh's Lok Dal. But even after the filing of nominations begins, nothing is clear about seat adjustments, with the BJP announcing a non-negotiable list and the Lok Dal announcing its own firm list. Who will back out where, if at all, is not clear at the time of writing, though a 'joint campaign' by Charan Singh, Vajpayee and Jagjivan Ram is talked about. What is clear is that everybody is hell bent on adding to confusion. The concentration is on two of the four States which are to have Assembly elections on May 19 — Haryana and Himachal. There is not much that these brave warriors can do in West Bengal and Kerala, though the BJP hopes to

strengthen itself a little in Kerala where it has gained a foothold mainly because of Marxist mismanagement of affairs. The BJP-RSS danger-potential need not be minimised unduly, however.

No party's image is very bright in Haryana and Himachal, not excluding the ruling Congress-I. If the "non-Communist Opposition" displays a rare capacity to avoid any understanding that can at least minimise triangular and quadrangular contests—which are what Indira Gandhi and her lieutenants pray for—the Indira Congress is beset with internal problems, accentuated by the proximity of elections and choice of candidates. In a swift move, the Haryana and Himachal Assemblies have been dissolved, leaving Bhajan Lal and Ram Lal as caretaker Chief Ministers, with ornamental Ministries that can do no damage by way of promoting dissidence and pressure tactics using official authority. At least it betrays the Congress-I leadership's worries about its own cronies even in States under its rule.

While no one will mourn the demise of the hilarious "unified command" set up by the inglorious Chandigarh convention — the personalities involved would not have cut much ice anyway — the way Charan Singh has asserted himself and the way the Lok Dal "rebels" knuckled under, including the pompous Biju Patnaik who owes little to Charan Singh in his home State of Orissa, do have lessons for the Opposition. They cannot forge an alternative in a hurry merely for electoral purposes, and they cannot achieve even a united front at short notice with no objective other than to fight Indira Gandhi. The public is generally sick of talk of revival of what is described as "the 1977 spirit"; it only reminds people that the same old lot of political operators are at work still, and bereft of the aura of JP's 'Total Revolution' in the wake of Emergency excesses, they are in no position even to hold talks, not to speak of forging unity or reviving an imaginary "spirit".

The contrast between what is happening in Haryana and Himachal on the one hand and developments in Kerala and West Bengal on the other, is too glaring to be missed. Kerala is under President's rule and by the Haryana-Himachal logic the absence of the Assembly should be an advantage to the Congress-I. The reality is different. The trickery by which the Nayanar Ministry was pulled down and the Karunakaran Ministry was installed, abjectly dependent on the Speaker's casting vote, has come home to roost. The United Democratic Front floated by the Congress-I is in quite a mess already, even after the prescribed period for filing nominations has begun. The dozen parties, mini-parties and factions that make up this patchwork Front do not at the moment show signs of purposeful or united functioning, or even of basic mutual understanding. The Left Democratic Front, with a clear programme, is in far better shape, even if the outcome of an electoral battle in Kerala will always remain a matter of guesswork till the votes have been duly counted.

As for West Bengal, the Left Front, which now happily includes the CPI also, is certainly in a strong position while the Congress-I led opposition, again a medley of disparate groups, is in deep turmoil. Unlike in Kerala, where the BJP claims it is capable of emerging as the "third force" and is reported to be making overtures to all and sundry, the RSS outfit is not a factor in West Bengal.

In the midst of all the electoral comedy to which most of our parties are contributing, the byelections to be held on the same day — May 19 — seem to have been forgotten. For example, the Garhwal byelection, postponed twice earlier for no valid reason, is important, even if Bahuguna has not remained as glamorous as he used to be. That even this time the UP Chief Minister is not happy at the holding of the byelection speaks for itself. It is strange that a national party which boasts the only leader with national mass appeal, should feel scared of the possible entry into the Lok Sabha of one individual whose only asset is a once bright and now somewhat dim image among the minorities and the Harijans, apart from sections of the Left.

There is nothing so far to indicate that choice of candidates will be with the public good in view — at least, partly — and not merely to strengthen the number of yesmen. Much has been said about "defectors" and "late-comers" whose loyalty is doubted by the entrenched coterie of sycophants. How will Indira Gandhi exclude the lot without intensifying dissidence which is already rampant in her party? Is she really in a position to clean the Augean stables? Again, Maneka Gandhi may not be a big factor, but the mischief potential of the forces making use of her for propaganda — ranging from rank communalists to angry members of Indira's own party — can hardly be brushed aside.

As for any "alternative" emerging, let us wait. It will be a long wait, even given the state of disarray in the ruling Congress-I, judging by the refusal of doddering ancients to quit the political scene and by the failure of youthful and honest people to get into the ranks of active secular, democratic, progressive parties and forces.

Nothing short of total reorganisation of our political establishments can answer national needs, whatever the alignments in the coming elections and whatever the outcome. Beyond pre-poll acrobatics is the nation's future. There is no room for complacency, especially among Left and democratic sections.

COMMENTARY

The Saudi Arabian Connection

THE Saudi Arabian media comment that Indira Gandhi's visit to the Kingdom filled a "communication gap" between the two countries that has existed for a quarter of a century, merely reflected a reality. The absence of mutual warmth in Indo-Saudi relations was sought to be erased only a couple of years ago when both realised the potentials of economic cooperation. The Saudi response was particularly heartening in that the realisation was linked with the discovery that it was possible for an Islamic monarchy to share with a non-aligned, secular republic the responsibility of promoting economic inter-dependence. But on the political plane, a few bridges had to be built before bilateral relations could be vested with flesh and blood. That the process of building such bridges was assisted by no less a person than the PLO leader, Yasser Arafat, who prepared the ground for Indira Gandhi's visit, is testimony to the esteem in which India is held by the Arab world. In the larger context of India's relations with the Arab world as a whole, Indira Gandhi's visit to Saudi Arabia and its fall-out may eventually transcend the limited objective of filling the 26-year-old "communication gap".

In a sense, the 26-year interregnum was a waste. King Ibn Saud, who visited India in 1955, was perhaps a believer in sustaining traditional Indo-Saudi friendship despite the birth of Muslim Pakistan. But right from the days of King Faisal, who succeeded his brother, the Pakistan factor has tended to cloud and sour mutual understanding. There appeared to be no common basis for friendship between a pro-West, feudal and conservative monarchy (and a dominant leader of the Islamic Conference to boot) and a non-aligned secular republic, notwithstanding or perhaps because of the 100 million Muslim population of India. The clash between theocracy and secularism was only one of the aspects of Indo-Saudi relations; the other was undoubtedly the conflicting perceptions of regional stability. The inter-action of superpower strategies ever remained a hurdle in the way of a meaningful relationship based on mutual confidence and respect.

Indira Gandhi did not journey to Riyadh as a supplicant for petro-dollars. The beginnings of technical and economic cooperation had already been laid in 1977, and reinforced in 1981. The Saudi Fund for Economic Development had loaned 100 million dollars for financing the Srisailam and Nagarjunasagar power projects. Yet another loan of 32 million dollars came through for the Koel-Jaro hydro-electric project in Bihar. The 1981 agreement provided for the setting up of a joint commission for consolidation of economic and technical cooperation. Meanwhile, a sizable and significant Indian presence had been established in Saudi Arabia through participation by and involvement of Indian expertise in Saudi development and the opening up of the means of livelihood for as many as 150,000 skilled and semi-skilled Indian workers who are currently employed in the Kingdom. As many as 42 joint ventures flourish there and both public and private sectors are involved in them. There have been satisfactory arrangements for crude imports by India, albeit the quantities imported continue to remain small.

So, if Indira Gandhi's trip became necessary, it was to establish a political framework in which mutually beneficial economic inter-dependence can thrive in a suspicion-free political scenario buttressed by shared perceptions on larger global and regional issues of immediate concern and relevance to the two countries. A basis for developing such a framework was readily available. India's strong backing for the Palestinian cause and its refusal to forge diplomatic links with Israel evoke responsive chords in the Arab mind. The significance of Indira Gandhi's support for Crown Prince Fahd's plan for resolving the West Asian crisis could not have been lost on Saudi Arabia. Secondly, India had much cause for satisfaction in the stand of the Gulf Cooperation Council that the security of the region is a responsibility of the countries concerned and not that of either superpower. Saudi Arabia is admittedly a supporter of the American strategic consensus concept, but the support falls short of permitting American interference in the region or allowing US belligerency to dictate the policies and options of Arab oil diplomacy.

Both India and Saudi Arabia have also conceded the usefulness of parallel initiatives by the Islamic Conference and the non-aligned movement to bring about peace between Iran and Iraq. Consistent with its non-aligned position and outlook, India has also refrained from involving itself in the conflicts between Islamic fundamentalism and Arab socialism, which in a sense lie at the core of the current West Asian crisis.

Indira Gandhi's objectives can therefore be seen to be two-fold. In the first place, her Saudi hosts had to be convinced that India is not only fully reconciled to the reality of Pakistan but is desirous in its own self-interest to ensure a strong and stable Pakistan as its immediate neighbour. Secondly, India welcomes Saudi-Pakistani fraternisation as part of the consolidation of Islamic solidarity. But if such fraternisation leads to a tilt in the sub-continental balance against India and consequently to an arms race in which Pakistan is financed by Saudi Arabia and its Western allies, regional stability would be adversely affected. In such a case, even Saudi Arabia could hope for no long-term benefits for its own regional influence. This is why Indira Gandhi cautioned her hosts that the induction of sophisticated arms into Pakistan might spark an arms race and pleaded that whatever the nature of Saudi-Pakistani relations, Riyadh should not give the impression of taking sides with Pakistan merely on the ground of Islamic closeness ignoring the fact that India is sparing no pains to normalise bilateral relations with its neighbour. The Crown Prince's cryptic comment that Saudi Arabia was appreciative of the Indian efforts gives room for the hope that she had made out a convincing case.

On the even larger issue of external interferences hindering regional economic development, Indira Gandhi and King Khaled and Prince Fahd appear to have reached a measure of agreement which can only be described as highly encouraging. Prince Fahd is reported to have commented: "The vested interests of super-powers ought not to be allowed to distract us from our duty towards development." That the guest and her hosts were in a position to advance identical assessments of the dangers of foreign intervention indicated that both identified such interventions as sources of the current tensions, not only in the Arab world but also in South Asia. King Khaled, according to newspaper reports, was particularly impressed by Indira Gandhi's expression of opposition to all external interventions and by her disclosure that she had had occasion to point this out to Soviet leaders vis-a-vis the Afghan crisis.

Apart from this, there seems to be good reason to feel satisfied at the outcome of the Prime Minister's visit. Her decision to take a delegation of ministers and high-ranking officials has paid rich dividends in that they have been able to carry conviction with the Saudi leaders that the hundred million Muslims in India are an integral part of our people and have the same rights and responsibilities, the same advantages and disadvantages, as the rest of our people. This is indeed a great gain.

The Prime Minister and her party

have also succeeded in explaining to the Saudi leaders the immense scope for widening economic cooperation and extending it to areas hitherto unexplored. Areas where new complementarities can be built were identified, and the Saudis displayed commendable willingness to invest in new projects out of the Saudi Development Fund. Indira Gandhi is reported to have responded promptly by assuring them that there would be no tardiness in follow-up action on the part of India. A list of projects along with an expert team is to be sent to Saudi Arabia in the immediate future. Prince Fahd also invited Indian participation in a larger number of joint ventures in fields like construction, manufacturing and contracting. Of even greater significance was his assurance that Saudi Arabia was trying to bring about stability in oil prices and would, at the same time consider putting oil exports to India on a more regularised basis. Indira Gandhi's Saudi visit has once again underlined that the interests of the Gulf countries and the sub-continent are interlinked. Practically every Gulf and Arab country has come to acknowledge this position, including Egypt.

These are all gains which need to be noted in favour of a visit that was long overdue and which has ended on a mutually satisfactory note. The exchange of an elephant and camels and horses may symbolise the restoration of warmth in relations, but more than this, the rapport that has obviously emerged on the human plane between Indira Gandhi and the Saudi leaders ought to usher in a new era of relations.

April 21

Sense on Language

LANGUAGE has always been a sensitive issue, and the Karnataka Government's handling of it can hardly be commended, though finally — and after needless delay — it seems to have arrived at a sensible solution that can help assuage feelings if fanatics and politically motivated operators can be held at bay. As these lines are written the preparations for a Karnataka bandh are in full swing, which is unfortunate in a State known for long as one capable of accommodating diverse languages, religions and opinions. Linguistic fanaticism is certainly not part of the tradition of Mysore earlier or Karnataka in subsequent years.

It can hardly be disputed that Kannada should enjoy pride of place in Karnataka, even as other regional languages should in the respective areas concerned. That is the whole point of reorganisation of States on a linguistic basis, not the promotion of linguistic chauvinism, though the latter has been the consequence in many parts of the country. So far as Karnataka is concerned, the sentiments and needs of the linguistic minorities, forming one-fifth of the State's population, can hardly be brushed aside without dangerous consequences for people's unity within that State and for national integration.

The Gokak Committee, whose report is the basis of the current agitation which has taken a violent turn, was appointed because of the controversy between protagonists of Sanskrit and Kannada. But the Committee sprang a surprise by recommending that (a) Kannada should be the sole first language with the existing weightage of 150 marks for all students at high school stage; (b) one of the following should be the second language with a weightage of 100 marks: Tamil, Telugu, Malayalam, Marathi, Gujarati, Urdu or Hindi or English or Sanskrit, Arabic, Persian, Latin, Greek; (c) any one of the above languages not chosen as second language should be the third (50 marks weightage) with a compulsory examination. That is the gist.

Chief Minister Gundu Rao, without studying all the implications of the new formula, hurriedly announced acceptance in toto of the Gokak report. Reactions of the linguistic minorities, coupled with sober second thoughts on the part of the Government, led to caution, but not before the chauvinists and their friends had had time to organise agitations with increasing tempo.

It is not easy to see why Kannada-lovers should get agitated over the State Government's latest decision which appears to be a sensible compromise. While not accepting the idea of making Kannada the sole first language, the Government has made its study compulsory for non-Kannada students in schools. The first language group will consist of Kannada or the mother-tongue (Hindi, Telugu, Tamil, Urdu, Marathi and English) carrying 150 marks. The other two languages to be studied will be from among Kannada, Marathi, Hindi, English, Sanskrit, Arabic and Persian — with 100 marks in each of the two. That Sanskrit has been pulled out of first-language status — which was really the issue over which controversy originally began — should satisfy Kannada lovers. And that Kannada is to be compulsory for the linguistic minorities would ensure mutual adjustment among all sections in the State.

Why then the hue and cry and the violent agitation? It is sad that even intellectuals and litterateurs, who should have been in the vanguard of a movement to bring about unity and integration among different sections of the State's population, have preferred to join the chauvinist bandwagon. The film star who has jumped into the fray no doubt felt he could get quite some mileage out of the populist slogan to buttress his proposed political career. Communal politicians and sectarian leaders may find it convenient to be in the agitation or to be openly against it. None of these evidently has the interests of Karnataka, short-term and long-term, in view.

It can be argued, quite logically, that even if under the Gokak formula Kannada is made the only first language, the Committee's silence on the medium of instruction can be taken to mean that the medium can be another language, perhaps the mother-tongue of the persons concerned. But surely these are not problems that are solved on paper. Emotions, handicaps, family backgrounds and a host of other relevant factors intervene. These have to be taken into consideration. The example of Hindi as national language has lessons, even if the regional language stands on a different footing, being confined to the State and being part of life in the region concerned. The idea of imposition is what creates problems. No formula that fails to take into account as far as possible the needs and difficulties of different sections of the community can have smooth-sailing.

At the back of many of such agitations — like the one in Assam, for example — is the question of employment. It is widely accepted — indeed it is part of national policy enshrined in the Constitution — that people from any part of the country should be able to work in peace in any other part of the country. The present agitation in Karnataka — like the anti-Hindi agitation earlier in Tamilnadu or the Maharashtra-for-Maharashtrians campaign led by the Shiv Sena or the sons-of-the-soil theory exploited by self-seeking leaders in some parts of the country — can have harmful consequences for the State as well as for the country. There are Kannadigas in other parts of the country, even as there are linguistic minorities in Karnataka. The people from other States who have settled down in one or other State and have been working there, have made their own valuable contribution to development and culture. These truths should not be ignored for the sake of populist and transient gains.

It can only be hoped that the agitation in Karnataka will cease and that the way will be cleared for discussion, if necessary, on any outstanding questions in this sphere. Dialogue, not confrontation, is the need. Can it be honestly said that the Karnataka Government, whoever may be running it at the moment, is less interested in Kannada, the State's language, than those who are shouting themselves hoarse over the Gokak report and its modification by the Government? Let us be fair — and honest to ourselves.

C.N.C.

April 20

Offshore Exploration and India's Security

SAILENDRA NATH GHOSH

THE Union Government's decision to entrust exploration and exploitation of hydrocarbons in Saurashtra offshore region to a foreign company is fraught with danger to Indian security. Evidently the decision has been taken without consideration of all aspects.

It is an open secret that oil exploration companies operating in the seas keep in close touch with the Departments of Navy in their home governments. What remains to be appreciated is that offshore exploration rights give scope for certain intensive studies and hence collection of certain strategic information, which are not available by any other means.

There is a misconception that all the critical information, in which an alien power could be interested, is already available to the super-powers. It is often argued that the satellites orbiting in space, the international oceanographic expeditions and the submarine movements that have taken place have yielded all vital information. This is just not true.

Undoubtedly, enough harm has been caused by allowing foreign companies to prospect for oil in offshore Kutch, Kaveri basin and the Bay of Bengal. These lease-periods gave the companies opportunity for *continuing* studies which might have yielded some most important strategic information. But the argument that "harm has already been done" cannot be a justification for allowing the harm to continue.

It is necessary to note the limitations of satellites in space and the submarines in hurried movement. The advantages that an operating company can reap from its opportunities for systematic, persistent and repeated studies of certain phenomena are enormous in comparison.

Satellites can take pictures, in separate bands of ultra-violet, infra-red and micro-waves. Hence these cannot yield the most crucial information about the ocean layers. Among the pictures that a satellite can take, those in ultra-violet are not of much use. Even air can attenuate these. Pictures in infra-red cannot penetrate up to the sea-bed because water attenuates the pictures. Infra-red pictures can at the most detect some gross phenomena at, or very near, the water surface. The micro-waves get reflected back from the water surface.

That the pictures taken by the satellite are not all-inclusive can be proved by an instance. Before the Pokhran "implosion", the satellite did definitely sense a rise in local temperature but it could not be sure that it was not due to some economic activity. The potential of the satellite to help plan offensive activity *under sea water* is even more limited.

The author is former Director, Bureau of Petroleum and Chemical Studies, New Delhi.

Then, the idea that an alien power is interested only in the sea-bed configuration and that it is only a depression in the sea-bottom that gives opportunities for submarine hideouts is simplistic. An alien power is also interested in knowing the ocean profile, particularly its sound propagation characteristics and the zones of sound barriers. It is interested in knowing at which point of the sea, at which depth, between which hours of day or night in which season, an inversion layer develops to bend the sound energy and hence to leave the object beyond virtually free from detection. These data enable an alien power to know between which hours of the earth's diurnal rotation in which season, a submarine can enter into a layer impervious to sound energy and stay there for how long. To minimise the chances of its detection, it would like to know the limits of "active" and "passive" detection systems in the different layers of the sea at different points. This means, it would seek to know the limits, at each point of the sea, of sound energy transmitted by sonars and the limits of detection by static hydrophone arrays.

Detection range of the active as well as the passive system depends principally on:

(i) the temperature profile of the sea, *from the surface to the bottom*, for different times of day and night in different seasons;

(ii) the salinity profile, from the surface to the bottom, of each zone;

(iii) details of the sea-bed configurations in which the variations over small areas and the specifics are far more important than the generalities and broad features.

Undoubtedly, salinity and the depth variations affect the temperature profile and hence the studies overlap to a certain extent. But each has to be studied in depth, because the ultimate purpose of an interested power is to locate:

(i) the inversion layer, that is, the layer below which the transmitted sound energy will not travel to cause detection; and

(ii) the zone which can elude the hydrophones.

The inversion layers are both space-dependent and time-dependent phenomena.

Alien powers can get information about these layers by enlisting the support of an oil exploration company which has the licence to operate legally in an offshore area and thus to mask its practice of taking regular observations in the above direction.

Moreover, lately, certain highly sensitive instruments in micro-miniature forms have been developed. If installed on the operating platform or even on barges — or may be, on the hydrographic survey ship — these will be able to collect the acoustic signature of each member of our merchant and naval

(*Continued on page 34*)

Defence in the Eighties

P.K.S. NAMBOODIRI

LAST week in Delhi, the Commanders of the armed forces sat together in a South Block conference room in their periodical exercise to give shape to the nation's defence plans. True to military style the meeting was a simple and quiet affair, which largely went unnoticed.

From whatever little appeared in the press and particularly certain pointed remarks made by the Prime Minister and the Defence Minister in their addresses to the Army and Air Force Commanders, it appears that the political leadership also shares, partly at least, the apprehensions raised in some quarters about the growing burden of defence. Prime Minister Indira Gandhi told them on April 15 that while the Government was conscious of the importance of modernising the army, it was important that the defence problem should be viewed in the larger global politico-economic context. The Defence Minister, R. Venkataraman, elaborated this when he spoke to the Army Commanders the next day. He said: "While it is necessary for us to acquire necessary weapon system to match the capabilities of our potential adversaries, we should be conscious of the impact of a large defence burden on development finance and foreign exchange resources."

It may be noted that such counsel of restraint came at a time when the multi-billion dollar deal for 40 (plus option for 100) Mirage-2000 aircraft was being signed in Paris; the first batch of HAL-assembled Jaguars had taken off a week back; and new possibilities for weapon acquisitions had been opened up following Soviet Defence Minister Marshal Ustinov's visit to Delhi last month.

The country's approach to defence has undergone a tremendous transformation in the last three and a half decades since Independence. The decade of the fifties was a period of relative neglect as far as the security of our northern borders are concerned. While the nation's effort was concentrated on Five-Year Plans to build up internal strength, China easily encroached into Indian territory and carved out large chunks. Following the 1962 shock, Indian defence entered a period of moderate build-up during the sixties. Here again the focus was on raising and equipping mountain divisions to meet the Chinese threat and in the process the Pakistan front was largely ignored. Ayub Khan took note of this weakness and tried to overwhelm Indian forces in a surprise move in 1965. We barely managed to escape another major military reverse.

The re-equipment programme, which began soon thereafter, proved to be of decisive value in the 1971 conflict. With that victory the Indian defence effort seemed to have once again relapsed into a state of complacency. It was only in the late seventies that we began really implementing the modernisation plans.

Since the mid-seventies India's defence plans have assumed larger dimensions than the traditional China-Pak syndrome. This is partly because of a new security threat arising from the Ocean front due to increased militarisation of the Indian Ocean and its littorals. It may also be due to an increasing understanding of India's role in the South Asia region and the need for continued updating of the country's defence apparatus to give credibility to such a role. The Defence Minister gave notice of such thinking in Government when he said in the Rajya Sabha last month that "India's defence preparedness would not slacken irrespective of a threat or no threat from across the borders...Defence plans are prepared to meet contingencies which may arise from continuous assessment of the possible adversaries' capabilities rather than intentions". This is a logical approach since a country's defence is as much a function of its real and potential strength as it is of meeting the capabilities of its immediate and potential adversaries.

It is also a controversial approach and could be interpreted as being chauvinstic and hegemonistic. Events in the second half of the seventies appear to have profoundly influenced the thinking of many Indians, often to the extent of even distorting this perception of national security. Some of the more experienced of them have begun doubting the need and even the desirability of having modern armed forces for a poor country like India.

The end of the Mao-Zhou era in China, the unconventional nature of the new leadership under Deng, the military bashing China got at the hands of the Vietnamese in February 1979 and the improved relations between the two countries have all helped to change the popular image of China as a military adversary of any major consequence. Similarly, the developments in Afghanistan and the Soviet intervention there were regarded as having put Pakistan in an extremely awkward position, denying it incentives for renewed hostilities against this country. It is even propagated, with considerable force of logic, that since a new super-power threat to the subcontinent has arisen on the north west, both India and Pakistan should be equally concerned about it and make a joint response.

Thus, the two major adversaries — China and Pakistan — are now regarded as not posing any immediate and serious threat to India. Therefore, it is assumed that the present level of Indian defence preparedness is more than a match for them, not only now but also in the foreseeable future. It is also advocated that a militarily strong India would be a diplomatic liability in the country's dealings

Andhra Scene : Puppet Show?

C.N.

THE recent developments in Andhra Pradesh beginning with the ouster of former Chief Minister — Anjiah, and the rise of a new regional party led by a cine idol, N.T. Rama Rao, though they might look bizarre, on proper analysis fall into the set pattern of Congress-I group politics interposed on the concerted efforts of the ruling forces at the Centre to maintain their hold on the people, defeating the efforts at consolidation of the Leftist forces on one side and the extreme Right represented by the Bharatiya Janata Party on the other.

The recent political developments in Andhra Pradesh can be analysed at three levels. First as the politics of caste groups; second as group politics within the ruling party, and third as the politics of the Central Government vis-a-vis other parties and forces. Each of these levels again should not be seen as separate and autonomous activities but as inter-connected ones; and through national level politics they could also be seen as linked to some international developments.

Taking the first aspect, of late the caste-groups in the State have become more rigid. The four dominant castes in the State are Reddys having their stronghold in Rayalaseema and Telengana, the Kammas who form a significant ten per cent in the State but are mainly concentrated in the rich districts of Guntur, Krishna and Godavari, the Harijans who have now come to be an articulate but violatile group in the State, and the Brahmins who though a minority are having support from the Centre.

In spite of the Janata "wave" which took the shape of the rise of the rich peasantry, Indira Gandhi's party emerged victorious in the 1978 election to the State Assembly with the support of the weaker sections, securing 175 seats out of 295 by polling 38 per cent of the popular vote. The Janata Party and the Congress (U) led by a former Chief Minister, Vengal Rao, secured 60 and 30 of the seats respectively, though together they had polled 45 per cent of the popular vote. The Congress-I could not get suitable candidates and there were not many experienced persons among those elected. All the Congress (U) MLAs and 44 Janata MLAs later joined the Congress-I, and some of them found berths in the Government though 'loyalists versus later entrants' is still a burning issue within the party.

The tenure of Anjiah (who was foisted on the State by the late Sanjay Gandhi for the valuable service he is reported to have rendered in getting Amrit Nahata to their side in a court case) and the long overdue elections he organised to the 330 panchayat samitis on a non-party basis saw the emergence of Reddys as a force in all districts. Several candidates for the samitis supported by the MLAs got defeated, showing a clear erosion of their hold. According to one report, 185 panchayat presidents got elected in opposition to the candidates supported by the MLAs. Anjiah was seen as a weak Chief Minister who was not able to assert himself but was submitting to pressure lobbies. Indira Gandhi seems to have seen the developments as erosion of her own authority.

Coming to national level groups, the State has the distinction of returning the President, N. Sanjiva Reddy, the Prime Minister, Indira Gandhi, the Foreign Minister, P.V. Narasimha Rao, and the Minister for Petroleum and Chemicals, Shiv Shankar. Politics being what they are, the higher bodies cannot but intervene in local policies in the name of promoting the welfare of the State. When the replacement of Anjiah was decided upon, it is said that P.V. Narasimha Rao was backing Kona Prabhakar Rao who was then the PCC President, and because of that, opinion swung in his favour during the State legislature party meeting convened to decide on the leader, while Revenue Minister Janardhana Reddy was backed by the Reddys. The support of Reddys to Janardhan Reddy was however divided not only because of his background but because some of them feared him as a "strong man". The Kammas, who had not so far been able to capture the Chief Ministership, were making a determined bid to gain it. Anjiah, who had sensed it even earlier had dropped from his Cabinet Bhaskar Rao, a strong Kamma leader who was the right-hand man of Chenna Reddy when the latter was Chief Minister.

The State legislature party having left the choice of the Chief Minister to Indira Gandhi, a compromise was struck by selecting Bhavanam Venkatram Reddy whose better half is a Kamma and had been a Minister. Kona Prabhakar Rao and Janardhan Reddy were taken in the Cabinet and were given important portfolios. A Harijan leader, C. Das, was made PCC President. With the balance thus struck among all contenders and castes, the idea initially was to go in for a mid-term election along with West Bengal and Kerala though the term of the legislature is up to March 1983.

While it is said that the disappointment of the Kamma leaders over not getting the Chief Ministership has given rise to the regional party with Bhaskar Rao at its back and N.T. Rama Rao, popular Kamma film actor in the forefront, the real reasons for this new phenomenon are to be sought elsewhere. The Centre had been receiving reports of concerted efforts by the Leftists as well as by the BJP to consolidate themselves in the State. The Lok Dal also has been making inroads. Charan Singh drew larger crowds in Guntur and Krishna than Rajiv Gandhi when they both visited these areas about the same time recently. The BJP leader, A.B. Vajpayee, had also been attracting crowds during his recent tour of the State. The Lok Dal, BJP and Janata have 16 legislators while the CPI and CPM have 15 in the present Assembly. More disturbing to the Centre than the efforts of these parties has been the rise of extremist Naxalite groups, particularly in districts where Kamas are dominant. Home Minister Zail Singh, in an interview to a Hyderabad-based paper, had referred to increasing Naxalite activity in Andhra Pradesh and Karnataka aided and supported by some international agencies. Added to that, the weak State leadership of the Congress-I with a tarnished image had led to a political vacuum in the State. The Centre feared that all the opposition groups would take advantage of the situation.

The trend of Opposition consolidation was also evident in the elections to the local bodies. The prestigious Vijayawada Municipality has gone to the Communists and Visakhapatnam to the BJP. In the panchayat samiti elections also the Communists have fared well in Khammam and Nalgonda districts.

There is strong reason to believe that N.T. Rama Rao has been prompted by the Centre with the twin objectives of filling the political vacuum and diverting the people's attention, and also as a check against the rising power of Reddys. This is not the first time that this type of tactics has been adopted. A former Central Minister who was an eye-witness to the deal has confided that Indira Gandhi had prompted the Telengana agitation launched by Chenna Reddy in 1970. The noted political scientist Prof. G. Rami Reddy in his article "Andhra Pradesh — the Citadel of the Congress" states that the "Telengana Praja Samiti which was opposing the State Government was, however, pledging support to Mrs. Gandhi on national issues. In September 1971, with the resignation of Brahmananda Reddy as Chief Minister, it changed its strategy and decided to merge with the Congress". It seems that similar tactics are being adopted now. N.T. Rama Rao had also been pledging support to Indira Gandhi at the Centre.

Will the NTR ploy succeed? NTR's Party, as the new party has come to be known, is already being dubbed a Kamma Party and is bound to get most of the Kamma vote in Guntur, Krishna and Godavari where the Lok Dal and the Leftist parties were gaining strength. According to reports, the intelligentsia, disappointed with Congress-I politics, is also increasingly giving support to the new party, thereby taking away part of the vote which might otherwise go to the BJP. With his matinee idol image NTR may also succeed in drawing away part of the popular vote. But if Congress-I projects NTR as a sectional leader belonging to the rich Kamma clan, then the role of NTR would be limited and would just serve the purpose of preventing the opposition from gaining strength and it would at the same time remain amenable to the Centre. NTR's Party thus just suits the needs of the Central Government and the Congress-I leadership. (*April 19*).

Ershad's Problems and Promises

PARTHA S. GHOSH

By any reckoning, the four weeks during which Hossain Mohammad Ershad has been in power in Dacca is too short a period either to make predictions about the stability of his regime or to assess his performance as the deliverer. From a careful stock-taking of developments during this period one can however reach a hesitant conclusion that Ershad has come to stay. There has been no report of any opposition to the regime worth the name, not even a token demonstration. As for the eventual success of the regime, there are naturally many ifs and buts.

Ever since the military takeover at least one trend is clear, that the Ershad regime is serious about weeding out corruption. The General has again emphasised that the main reasons for the military takeover were "corruption, maladministration and a very bad law and order situation". As the roots of corruption are both political and economic, Ershad wants to deal with it at both levels. To what extent he will succeed will depend on variables only a few of which he as Chief Martial Law Administrator is in a position to influence directly and effectively. The rest have their roots in the past, and this would require him to adopt long-term strategies with a clear perspective and identified goals. They will encompass issues ranging from domestic ones like legitimisation of the regime to international ones like foreign aid or Bangladesh's international linkages.

Drive against corruption being the prime motto, the Ershad administration has decided to plug the first identifiable source of it, namely, politics. One can get a glimpse of the political rot that the country had been subjected to from the fact that there existed, according to the special branch of Bangladesh police, 74 political parties before the Martial Law Government banned them.

The Damocles sword has fallen on "corrupt" individuals. More than 300 people including six former ministers, top bureaucrats including four secretaries, industrialists, student leaders, besides politicians, have been arrested. To deal with their crimes five special Martial Law courts, each headed by a Lt.-Colonel, have been constituted. In their very first judgement, former Deputy Prime Minister Jamaluddin Ahmed has been sentenced to "rigorous imprisonment until the rising of the court" and fined taka 350,000 for corruption and criminal misconduct.

By far the worst victim of the regime's wrath has

Dr Ghosh is Visiting Fellow at the Centre for Policy Research, New Delhi.

been the BNP. Of course it is logical that a military junta which has wrested power from a political party should identify the latter as its chief enemy. History has several instances to show that a military regime always tends to build its tower of power over the grave of its predecessor.

There is however another dimension to this development. As it is imperative in Bangladesh politics for any ruler to register mass support for his rule, the anti-BNP stance may be one of Ershad's first steps in that direction. It may be noted that there has been a subtle change in his posture. The General had orignally said he had no political ambitions. But later he qualified it by saying that he did not want "to do politics in army uniform". Reading between the lines of these statements along with his reference to framing a new Constitution etc., one can get an idea of his future plans. In a statement in Dacca before the divisional and deputy commissioners, Ershad reiterated his conviction that "power really rests with the people" and said: "Such a people-oriented system must be free from personal ambitions and will apply even to the Constitution which hitherto has been tailored to suit personal needs rather than national aspirations". In these there is a clear reference to the tailor-made Constitution adopted by Ziaur Rahman. It appears that Ershad has two long-term future objectives — to launch a political party of his own and adopt a new Constitution to suit his future political needs.

As a short-term strategy, Ershad recounts the circumstances that necessitated the military takeover and reiterates his commitment to restore democracy in due course. As part of the same strategy his regime maintains, as far as possible, a low profile. Unlike in the case of new military regimes elsewhere, not many army personnel patrol the streets in Bangladesh; nor has the facade of a civilian administration concerned with day-to-day life been done away with.

Indications are that Ershad has succeeded in meeting the immediate challenge. Both direct and indirect evidences show that people have generally approved of his takeover. But the long-term stability of his regime and his political future will ultimately depend on two factors — his popularity with the people in uniform and his economic policies.

In the absence of hard data nothing much can be said about Ershad's base in the military. No military regime can afford to allow opposition to it among its ranks, much less reporting of any such development. A countercoup is always news and not the culmination of a series of reported events.

Informed speculation about his position in the military being not possible, we have to be content with an analysis of his economic policies that would ultimately influence his political future. What attitude he adopts to the institution of foreign aid will go a long way to influence his political style and alignments and determine his support base.

External aid is one single factor which has a tremendous bearing on Bangladesh politics. Although Bangladesh does not influence the world economic system, developments in the latter invariably cause ripples in the former. Rehman Sobhan, an eminent Bangladeshi scholar and former member of the Bangladesh Planning Commission in charge of the Divisions of Industry, Power and Natural Resources and Physical Infrastructure, has characterised the developmental process in his country as "crisis of external dependence". "Bangladesh policy-makers", Sobhan writes, "must wait upon decisions in Washington, London, Tokyo, Bonn and Paris before they formulate their annual development budgets, announce an import policy, formulate a food policy, or even decide how many children should be born. The decision-makers of the developed world hold the lifeline of any regime in Bangladesh...and can create havoc in the life of the country in a way that would have been inconceivable two decades ago. *The sovereignty of the Bangladesh nation state, in its prevailing social configuration, is therefore a polite fiction which is perpetuated by the courtesy of the donors as long as Bangladesh does not challenge their current strategic assumptions and ideological preconceptions.*" (Emphasis added).

The origin of Bangladesh's crisis of dependent development can be traced to the massive injection of foreign aid that was necessitated after the liberation war to rehabilitate the ten million refugees displaced by the war and restructure the war-ravaged economy. Ever since, it has been a tale of ever-increasing dependence on foreign aid, establishing Bangladesh's image as an international "basket". It has been estimated that in 1980, 85 per cent of the country's development budget, 60 per cent of its investments and 63 per cent of its commodity imports depended on foreign aid.

In the absence of an indigenous capitalist class, a situation which was the legacy of Pakistani "colonialism", external aid inflow has created a dominant class whose prosperity is directly and indirectly dependent on it. With limited control over productive assets, this class primarily works as an intermediary between the world system and the Bangladesh ruling elites through functions ranging from such direct ones as representing foreign suppliers as commission agents to such indirect ones as distribution of goods imported by the state trading corporation. As the volume of external assistance has systematically increased (from 198 million dollars in 1973-74 it rose to 6,469 million dollars in 1977-78) the prosperity of this class has also grown. In 1975, there was only one millionaire in Dacca; in 1978, the city could boast of at least 200.

Besides this class of intermediaries, there are also others who have over the years developed vital stakes in the foreign aid regime. Many state functionaries seek more aid to serve as shock-absorbers for their own managerial failures. The aid structure has also resulted in a consumption pattern among the affluent sections which can be sustained only by perpetuating the system.

The aid syndrome has its most visible impact on the food front. Besides the aid-supported rationing system in urban areas, it concerns the rural poor too. Bangladesh now imports about 12-15 per cent of its consumption of foodgrains. This constitutes about 30-35 per cent of the marketed grain. It may be noted that at least 50 per cent of domestic output is not marketed. By analysing these figures against the background of the fact that about 75 per cent of the rural households (including 50 per cent of functionally landless) find it difficult to ensure subsistence from their cultivable land and seek supplementary sources of income, one realises the extent of dependence of these people on food aid. As opposed to subsistence cultivation, these people depend fully or partly on the market economy which is heavily dependent on foreign aid.

In short, the very existence of Bangladesh has over the years come to depend on the inflow of external aid, and here lies the crux of the malaise that now grips the country. The institutionalisation of corruption against which Ershad has launched a crusade largely gets its sustenance from this structure of dependence. Hence, unless he ventures to root out the disease itself, treating the symptoms will be of little use.

It is naive to expect overnight changes. The process has to start with better management of aid money in the first place, culminating eventually in the development of a self-reliant economy. There are indications that Ershad has both short-term and long-term perspectives in this regard. While on the one hand he has sought to impress upon the Aid Bangladesh Consortium, which will meet for three days from April 20, that his Government is committed to better management of aid money, on the other by dissolving the 53-member pool of envoys he has more or less declared that foreign aid should not form part and parcel of the country's way of life. Formed two years ago, the pool was supposed to work in liaison with the donor countries to ensure a constant flow of aid.

On April 10, in a major policy initiative, the Ershad administration announced an eight-point economic programme with the basic thrust of promoting and protecting indigenous industries. Consumer goods that can be produced at home to meet domestic need are not to be imported any more. This is of no mean significance. Ever since Ziaur Rahman's coming to power Bangladesh was flooded with imported consumer goods and the middle class life-style had come to depend to a large extent on these goods. In this respect Ershad's step is a bold one which seeks to serve larger national interests even at the cost of alienating an influential section of the population. One will have to watch its impact for it is not merely policy that matters but implementation.

Where do relations with India figure in Ershad's scheme of things? His recent references to New Moore and sharing of Ganga waters make it necessary to watch his future moves carefully. He is reported to have said in this connection that his Government would "never compromise national needs and interests under any pressure, however small (a country) we are". Maybe making such statements is a political necessity. As long as the dichotomy between Bengali nationalism and Bangladeshi nationalism (see author's article in *Mainstream*, August 29, 1981) is not resolved, such statements about India would be politically relevant. But while this determinant of Bangladesh's India policy is very important, what probably would ultimately determine it is Bangladesh's external linkages.

So long as aid dependence persists, Bangladesh would have serious constraints in following an independent course of action in its foreign relations. But in Ershad's drive towards self-reliance one can expect new policy initiatives in this sphere. Seen from this perspective, Indo-Bangladesh relations might enter a new phase. Events such as overnight detention of Indian newsmen in Dacca by the Bangladesh police must not lead to prejudice about

DISCUSSION

Press Commission Report

Discussion on the Report of the Second Press Commission — which is yet to be officially published at the time of going to press — began in these columns last week (*Mainstream*, April 17, 1982) with a contribution from G.N. Acharya. This week we publish two more articles, one by S. Viswam, member, Press Council of India, and the other by A. Raghavan, President-elect, Indian Federation of Working Journalists. Further contributions on other aspects will appear in subsequent issues. —*Editor*

'Teeth' for Press Council

S. VISWAM

"TEETH" is the word that has haunted Press Councils all over the world. Should Press Councils depend for their effectiveness on their moral authority or on sanctions? Would not a Press Council without "teeth" be defied with impunity because it would then have neither the power to punish nor the force to deter? And if such institutions like Press Councils which basically discharge "watchdog" roles have to be invested with penal powers, should there be limits to such powers?

Such questions have been dealt with by Press Councils in the context of the concept of freedom of the press prevalent in their own countries. There is perhaps only one Council in the world which enjoys the power to levy fines. By and large, other Councils have been content to depend on their moral authority to entrench themselves in the esteem of their country.

The erstwhile Press Council of India was dissolved by the Government in 1976 in circumstances not particularly happy to recall. The Second Council which began functioning in terms of the Press Council Act 1978 was also inevitably faced with the question of "teeth". After a number of sittings and fairly wide exchange of views, it decided in favour of suggesting to the Government that it be empowered in slightly broader and deeper terms than those provided for in the 1978 Act to enable it not only to become more effective but, more importantly, *to give the impression to the community at large that it was in fact so.* The Press Commission, which laboured for more than a year under the chairmanship of Justice K.K. Mathew, has just submitted its report. It has endorsed the Council's demand for more powers and in addition made a few other recommendations vis-a-vis the role of the Press Council of India which need to be examined, if only because some of the recommendations have been made on its own and not at the behest of the Press Council. The Commission's report comes at a time when the Third Press Council, reconstituted on March 1, 1982, is about to begin its three-year term. It will be doubt study the implications of the Commission's recommendations and offer appropriate reactions.

A number of Press Councils in the world have been modelled on the British pattern. The question of "teeth" figured in the hearings of the three successive Royal Commissions on the Press in Britain. In his well-known book, *The Press Council: History, Procedure and Cases*, H. Phillip Levy refers to the evidence led before the Second Commission. "The Commission was told in evidence that a sense of responsibility in the Press could only be achieved by putting behind professional standards a sanction sufficiently strong to deter journalists from violating them." Later on, he says that when those who urged strong-arm discipline realised that the Press Council was to have no power of punishment they immediately assumed that it would have no authority. A reprimand, however severe, was no substitute for a penalty that would punish and deter. But according to Levy, the critics completely underestimated the strength and effectiveness of the Council's censure.

"The obligation and moral duty of a newspaper to publish an adjudication of the Council against itself had the effect of reinforcing the Council's condemnation with the condemnation of the public which the publicity ensured. Nothing can be more disparaging and unwelcome to a newspaper which values its good name than to be obliged to publish to its readers a judgement of the Press Council that it has infringed journalistic standards" (p. 466).

When the Press Council of India was seized of the question of "teeth", the issue that inhibited it considerably was this: what would be its position in case "the obligation and moral duty of a newspaper to publish an adjudication against itself" is not met by the newspaper censured? What would be its position if in spite of its admonitions, the erring/defaulting newspaper(s) cocked a snook at the Council's decisions? Would this not have an adverse impact, not only on the morale and influence of the Council itself, but also on the community at large?

The Press Council of India has followed a healthy tradition of reaching decisions by consensus. This was as it should be. But there were some in the Council who argued, in terms of Phillip Levy's thesis, that the Council should neither seek nor acquire more powers than already vested in it under the 1978 Act (which was an improvement over the previous Act of 1965 since Article 15(4) empowered it to make observations against the conduct of any authority including the Government), that its moral authority, was a strong sanction in itself and that the very concept of penal powers was repugnant to the concept of a free press. Levy sums up such a point of view admirably. He says: "The role of the Press Council is that of educator not inquisitor; its method is persuasion not force; its weapon is publicity not punishment; its appeal is to conscience and fair play. In a free press sanctions would be an incongruity". (p. 466).

There was, however, a strong section within the Press Council which felt that without some minimum powers, its effectiveness would be limited. There was no point in the Council adjudicating a case against a newspaper if it did not have the power to enforce its adjudication particularly on the erring paper. Secondly, it was argued that there ought to be a mechanism to "put the fear of the Press Council" into the erring newspapers if they attracted censure from the body repeatedly. In his foreword to the First Annual Report of the Council (1979), the Chairman summed up the sense of the Council in the following words:

> "The question of sanctions and sharper teeth for the Council is exercising many minds. It has been considered inadvisable to lay down a tariff of fines for recalcitrant newspapers for various offences. One form of bite can be to suspend a newspaper or a journalist from publication or professional practice respectively. The still sharper bite can be to send an editor occasionally to jail. But it has been said quite rightly that there are more than enough people doing that under other laws without much result in decrease of commission of offences. Perhaps some other sanctions may be more appropriate. In Turkey the Press Council can recommend stoppage of release of Government advertisements for a specific period in case of habitual offenders. Additionally, the Press Council can recommend reduction in the supply of newsprint or at least stoppage of growth rate of newsprint for specified periods, where the conduct of a particular newspaper is contumacious and other sanctions have totally failed. In the prevailing climate, when moral values stand eroded, some sanctions which will affect the erring newspapers financially, may turn out to be more effective than the punitive measures emenating from the ancient idea of 'tooth for a tooth'."

The eventual decision of the Council was in effect a compromise between the differing points of view. The additional powers demanded were sought to be made applicable to erring newspapers "which were indicted or censured repeatedly". Later on "repeatedly" was clarified to mean censured "thrice". The contemplated punishment? The discontinuance of Central and State Government and public sector advertisements for a period not exceeding six months; disallowance of any growth rate in the allocation of newsprint for a period not exceeding two years; the suspension for a period not exceeding one year of the concessional postage registrations by the P&T. In the case of erring editors and journalists, the punishment proposed was the denial of accreditation and related facilities for a period not exceeding six months.

The initial reaction of the Government to the Council's suggestions was not positive. The Government contended that legal advice was manifestly against such legislation. Denial of advertisements on the grounds that a newspaper has been censured thrice by the Council for offending against the standards of journalistic ethics or public taste, it was held, would amount to blacklisting, and any such action shall be legally sustainable only if the ground on which the newspaper has been censured related to Article 19 (2) of the Constitution. Similarly, it was held by the Government, disallowing growth rate of allocation in newsprint would directly restrict circulation of newspapers and thus abridge freedom of speech and expression. It was, however, suggested that a "reasonable restriction" could be imposed on such freedom, provided such restriction was made on the grounds mentioned in Article 19(2) of the Constitution. The withdrawal of concessions on postage granted to registered newspapers was also observed to attract a similar objection. It was argued that such a penalty would not be on fiscal grounds but on the ground that what a newspaper publishes is not considered desirable. Apart from the fact such action might not be justified or within the scope of the Post Office Act, this could also be considered to be a direct infringement of the freedom of expressiom of opinion, for there was no purpose in publishing or printing a newspaper unless it could be despatched. Moreover, it was argued that it would be necessary to prescribe an appropriate time-limit within which the alleged infringement may have been committed by the newspaper to attract imposition of penalties in the form of withholding of advertisements.

The Council considered the Government's point of view and offered clarifications. The Council felt that the suggestions made by it earlier were intended to be given effect to only to the extent permissible under the provisions of the Constitution of India and that it was precisely the case of the Council that any suspension or denial of advertisements to a newspaper which is censured thrice by the Council for offending against the standards of journalistic ethics or public taste shall be directed only when the grounds of the censure clearly fell within Article 19(2) of the Constitution. The Council felt that a reasonable restriction could be imposed in regard to disallowing of growth rate of newsprint allocation strictly on the grounds mentioned in Article 19 (2). Withdrawal of concessions on postage granted to registered newspapers was not suggested as being within the scope of the Post Office Act but by way of an amendment to the Press Council Act 1978. In the opinion of the Council, the argument that such a restriction would be a direct infringement of the freedom of expression was not well-founded in that, while the withdrawal of concession on postage would involve some additional expenditure, it would not result in paralysing the whole process of despatch and distribution of the newspaper. At any rate, its validity could be sustained under Article 19 (2) if it was confined to those matters that are mentioned therein. The Council also conveyed its acceptance of the suggestion for prescription of appropriate time-limits within which the alleged infringement may have been committed by a newspaper to attract imposition of penalties.

The matter rests there, but meanwhile, the Press Commission has endorsed the Council's plea. It is possible that the Commission was not aware of the arguments advanced by the Government in expressing reservations over the Council's suggestions; it is equally possible that the Commission thought the Government's objections are mainly legal and technical and can be overcome through discussion. Now that the Council's views have been reinforced by those of the Commission, it remains to be seen to what extent the Government would be willing to bring about enabling amendments to the Press Council Act 1978. The Commission has, however, come to the conclusion that in the event of the additional powers sought by the Concil being given to it, "it would become essential to expressly provide in the Act that the Chairman of the Press Council of India have a judicial background and should preferably be a retired judge of the Supreme Court." Significantly, three members of the Press Commission (Girilal Jain, S.K. Mukherjea, and H.K. Paranjape) did not agree that the Press Council should be given penal powers.

The dissenting voice of the three members reflects the views of those sections in the Second Press Council who felt that the only sanction the Press Council should enjoy is the moral one. It had been argued within the Council that the institution's efficacy should and would be reflected not in the deterrence of its penal sanctions but in the quality of judgements it would be called upon to deliver from time to time.

Taking the case of the British Press Council, for example, it can be argued that it had at no time power beyond that of persuasion and publicity, but if the force of public opinion meant anything, these should be among the most powerful of all. The Council depended on the cooperation of editors and on being taken seriously by the press and the public. It relied upon newspapers publishing rebukes against themselves, however harsh they might be, and it did not rely in vain. In the whole history of the Councill there have been only two cases of editors refusing to give space to adverse adjudications. But naturally, all this took time. The Council was accepted as something to be reckoned with but as month by month and year by year it built up its code of "case law" it became less of an irritant and more of a refuge for aggrieved members of the public, besides being a useful guide to and corrector of the press.

The New Zealand Press Council, for instance, has no powers to punish or to impose any sanctions against newspapers; it exerts its influence purely by the exercise of its moral authority; where admonition or censure is applied, the publications concerned (as is the case with Britain) are considered morally bound to publish the Council's rulings. The Council functions essentially as a court of honour. The Swedish Press Council (probably the oldest tribunal of its kind, set up in 1916), on the other hand, has different rules. A newspaper which has been found to violate "good publishing usage" is expected to publish the finding of the Council in the matter, and also pay an administrative fine of between Skr. 1000 and Skr 3000.

In endorsing the Press Council of India's demand for additional powers, the Press Commission probably visualises contingencies where newspapers in India could repeat violations of accepted norms occasions after occasions and attract penalties. Such a contingency probably need not be ruled out altogether, although it is extremely doubtful if the majority of newspapers, invested with a sense of responsibility, would defy both the Council and public opinion in such a blatant manner as to single themselves out for earning the stigma of a censure three times in succession. It might perhaps be more correct to say that the Council was only attempting to arm itself against such contingencies. Unless the detailed arguments backing up the Commission's endorsement are gone through (this article is based on a summary of the Commission's recommendations) it may not be possible to fathom its rationale.

In almost all the Press Councils of the world, it has been accepted as a matter of convention, if not principle, that the presiding authority should be a judge. When a new Council came into being in Britain in 1963 in pursuance of the Second Royal Commission's report, there was an important change in its composition. The most obvious difference between the old and the new council was the infusion of the lay element, particularly in the person of the chairman. The earlier Council contained no representatives of the public. The British Press Council was however fortunate to have obtained the services of Lord Delvin, who brought to the body a quality of forensic adjudication." His nomination had at that time been interpreted as the first admission by the press that outsiders had the right to say what was, or was not, proper for the newspapers to print.

The merit of the Press Commission's recommendation in favour of a retired judge of the Supreme Court to head the Press Council lies in the fact that the Commission wants the principle to be sanctified by parliamentary approval rather than let it be observed as a convention. This is all to the good since the functions of the Council are quasi judicial in nature. Article 15 (1) gives the Council the same powers throughout India as are vested in a civil court while trying a suit under the Code of Civil Procedure 1908 in respect of summoning and enforcing attendance of persons and examining them on oath, receiving evidence on affidavits, requiring discovery and inspection of documents, requisitioning public records and issuing commissions for the examination of witnesses or documents etc.

The omission on the part of the Commission to comment on the current procedure for the appointment of the Chairman of the Council can be taken to imply that it does not find anything wrong with the prescribed machinery — the appointment being made by a committee consisting of the Chairman of the Rajya Sabha, the Speaker of the Lok Sabha and a member elected by the Council. There is however a body of opinion in the Country and within the Council that the prescribed procedure is perhaps not the ideal one since it does not preclude the possibility of the selection of the Chairman being subject to political considerations. (The inclusion in the Committee of a nominee of the Council is presumably aimed at neutralising any attempted politicisation of the procedure). Had the Press Commission thought more deeply on this matter, it could have rendered a useful service in suggesting an attractive and more satisfactory mechanism.

The Press Commission has not found it desirable that the Press Council should draw up a code of ethics for newspapers. This conforms to the opinion within the Second Press Council which had occasion to examine this question, in exercise of its role as a self-regulatory body for the Press.

law as provided in clause (b) of sub-section (2) of Section 13 of the Press Council Act 1978, speaks of "building up" a code of conduct for newspapers in accordance with high professional standards. Even though the First Press Commission had recommended the formulation of a code of ethics as one of the prime responsibilities of the Council, when Parliament actually came to enact the legislation in 1965, it made a departure from this and laid down that the Council should only "build up" a code of conduct. It was therefore decided by the Council that a discussion should be called for on the usefulness of building up, in course of time, a body of case law gathered from the principles formulated in the adjudication in the several concrete cases coming up before the Council. It is a matter of satisfaction that even during the brief three-year span, the Second Press Council has laid down some vital guidelines through its adjudication on a variety of themes. The Council has been able. to endorse the validity of principles tacitly acknowleged and observed by journalists as the unwritten ethics of their profession, and the concerned adjudications have already become part of the "case law."

The Press Commission has also made the following four recommendations:

(*a*) enactment of legislation to curb the influence of foreign money on the press: this calls, inter alia, for submission of annual accounts to the Council by newspapers giving details of revenue obtained from advertisements from foreign sources, and names of the top 100 shareholders with their nationality and address;

(*b*) an amendment to the 1978 Act to enable the Council to review the adequacy and quality of journalism training facilities in the country;

(*c*) monitoring of the performance of newspapers in respect of important issues by the Council; and

(*d*) representation of the Council in the proposed Newspaper Development Commission.

The Council has good reason to welcome all these recommendations (provided of course they are implemented by the Government) but it needs to be said regarding (*b*) that it is doubtful if the Council, with its existing limited financial resources, can undertake a venture of this kind and regarding (*c*) that notwithstanding its limited resources the Second Council had in fact launched an exercise in this direction by arranging for a study on the trends of reporting on developmental activities in the language press. In regard to (*a*) the only comment that can be made (without a perusal of the full report of the Commission) is that while the Commission had chosen the Council to be the instrument for detection of the influence of foreign money on the press, it does not seem to have recommended any precise deterrent powers for the Council to prevent, arrest or remedy such influence.

There will be general agreement with the Commission's view that the Council's approach to complaints involving allegations of foreign money in the Indian press should not be technical but substantive. In practice, however, the Council is called upon to function strictly within the four corners of legislation, and insofar as such legislation enables it to undertake "substantive" investigation of the role of foreign money, it ought to consider it its duty to do so.

The experience of the Council has been that the limits set by the legislation frequently act as a constraint on the speedy disposal of complaints brought before it. This cannot perhaps be helped. The Council can only retain the hope that as the general awareness among the public, and more importantly, among established authorities like the State Governments, in regard to its usefulness spreads, its functioning would be rendered easier. It ought to be a matter for gratification that the Commission should have recommended the continuance of the institution because in its opinion "within the limits set by the legislation it has done useful work". Because the earlier Press Council was dissolved by the Government abruptly and arbitrarily, suspicions have not entirely been erased in regard to the recurrence of such an action. The Press Commission's recommendation needs therefore to be doubly welcomed. The Commission has suggested an amendment to the Act to provide for the retirement of members by rotation in the interest of continuity. The rationale behind this suggestion is not clear. Under the law, no member, including the Chairman, can continue beyond two terms (each term is of three years' duration). Is the Commission advocating mid-term voluntary retirement by members? Perhaps the perusal of the full report may provide an answer.☐ (*April 19*)

Delinking and Diffusion

A. RAGHAVAN

Freedom of the press usually means non-interference by Government but there is such a thing as interference by private interests. I am unable to understand how a small group represents the freedom of the press. The fact of a big industry by itself owning a newspaper and owning chains of newspapers cannot be said to give the press the kind of freedom which the public should expect of it.

— **Jawaharlal Nehru** (*at All India Newspaper Editors' Conference, New Delhi, 1963*).

THESE were bitter words uttered frankly by the first Prime Minister of free India after 16 years of varied experience ranging from ecstasy to anguish on the concept and practice of freedom of the press, guaranteed by the Indian Constitution. The denouement came nearly a decade after the first Press Commission made its recommendations on the reform of the press, especially its structure of ownership and control.

After an exhaustive study, the first Press Commission, in its Report presented to the Government in 1954, came to the conclusion that "there already exists in the Indian newspaper industry a considerable degree of concentration. There is a danger that this tendency might further develop in the future. We are of the opinion that it would not be desirable in the interest of freedom of choice that this tendency should be accentuated." Therefore, the Commission suggested diffusion of ownership to bring about diffusion of control of editorial policy. It also suggested transfer of management of newspapers to public trusts. But these remedial measures mooted by such a high-powered commission headed by Justice G.S. Rajadhyaksha and whose members included Dr. Zakir Hussain, Acharya Narendra Deva, C.P. Ramaswami Aiyar and M. Chalapathi Rau, have been ignored by the newspaper industry all these years, the default being connived at by the Government.

And today, when the second Press Commission, headed by Justice K.K. Mathew, has picked up the thread and submitted a set of specific recommendations on the ownership and control of the print media the so-called national press has kicked up a rumpus. Columnists have started ringing the alarm bell, calling the people to arms, so to say, to save the press, now in the custody of a few barons, which is supposed to be truly free.

How free is it? One distinguished writer tells us that for the first decade and a half after Independence our Parliament was the effective forum of official accountability; now it is the press, especially what is self-financing; the big press, in other words. It is this press which is supposed to be uncovering things on which Opposition MPs have been going to town.

Every heard of Justice Vivian Bose Commission's Report? That was presented to Parliament in that decade-and-a-half, considered ideal. According to that Report, the second largest chain of newspapers in this country was bought over from the British by an Indian business house with funds, partly acquired by defrauding the national exchequer and partly by cheating the unwary share-holders. The Indian Federation of Working Journalists had submitted to the second Press Commission the relevant portion from that Report. Leave alone the "uncovering", how many newspapers had dared report those hair-raising revelations which were and continue to be part of the Parliament record? Again, in 1975 the two stalwarts who headed the same Indian business house were convicted and sentenced to jail terms for shady dealings in an aircraft company, one of the firms that figured in the Vivian Bose Commission Report. Who published the report of that conviction?

The most cacophonous is the *Express* group of newspapers, controlled by Ramnath Goenka. Goenka boys disrobe all. Three cheers for that. Except, of course, themselves. There was that case of plain cheating of the Punjab National Bank to which was mortgaged a huge consignment of non-existent newsprint bought from a non-existent Calcutta firm for a tidy sum of money drawn by one of the Goenka companies. After prolonged litigation a Goenka was sentenced to two years' imprisonment. We had looked, in vain, for a thundering piece from the prima donna of that group on the result of the court case. The *Express* seems to have got hold of the whole of the minute of dissent and started howling days before the Report was actually presented to the Government. It knows precisely where the shoe pinches. For, according to the IIPA study, one of those relied upon by the Press Commission, the *Express* is the largest chain in the country which brings out newspapers in six different languages and in 1979 controlled 27.7 per cent of the daily circulation in Telugu, 22.7 per cent in English, 20.1 per cent in Tamil, 19.7 per cent in Marathi, 13.5 per cent in Kannada and 11.7 per cent in Gujarati.

Readers are also sought to be pitted against the majority report, regaling them with fairy tales. One such is that the Commission has not established (*sic*) that newspapers, owned by business interests, have been biased in favour of vested interests in presenting news and views. Anyone who cares to turn the pages of these newspapers from the second half of 1969 onwards, will know what was dished out on bank nationalisation, abolition of privy purses, state trading in wheat, reactivation of the Directive Principles of the Constitution and so on. Why, Goenka even upset through court action the award which, for the first time, had evolved a national wage structure for poor journalists.

The second Press Commission has rightly dismissed all these pretensions. In the chapter on "the press as a public utility", it has dealt with the ownership pattern in the newspaper industry. As I write this I have before me only the body of recommendations on all the aspects touched upon. So elaborate comments have to wait till the full Report is available. The Commission has analysed the anatomy of the top 54 dailies listed in *Press India 1980*. Total newspaper circulation that year was 86.91 lakhs, of which dailies accounted for 65.70 per cent. Newspapers owned or controlled by companies or businessmen with interests in other industries were 27, commanding 40.87 per cent of the total daily circulation. The Commission had the benefit of the detailed IIPA study on ownership and control structure of the Indian press. According to that study, the "private industry-linked (daily) press" has a 47 per cent share in the aggregate circulation which worked out to 70 per cent in English, 73 per cent in Malayalam, 68 per cent in Kannada, 63 per cent in Tamil and 84 per cent in Telugu.

Further breakdown presented in the IIPA study is more revealing. A few national monopoly houses have cornered 30 per cent of the national circulation of the dailies. Of these, three are dominant: R.N. Goenka, Sahu-Jains and Birlas, in that order. All the three are interlocked through matrimony and/or business. There may be inter-house rivalries between them on peripheral matters but they invariably present a joint front against economic policies aimed at regulating big business. Each of the trio, in addition to enjoying a national position, has a region of its own in terms of circulation. The majority of the Commission made certain broad generalisations from the statistical layout of the Indian press as they saw it and drew certain firm conclusions. A few of their observations are well worth setting out here, for without them the recommendations they made on restructuring of the ownership and control of the press may appear to be populist, as one critic put it.

> Press is a public utility discharging the basic social function of informing the public. When newspapers are controlled by other business, they become the vehicle of expression of the ideology of their owners, and the selection, presentation and display of news in such newspapers would be dictated by that ideology. The newspaper industry in their hands becomes involuntarily the cultural arm of vested interests for maintaining the existing socio-economic system.
>
> Odd exceptions apart, commercial newspapers do not normally find a word to say in sympathy with the legitimate demands of the working class. They become naturally antagonistic to the implementation of certain key Directive Principles. Legislative measures intended to ensure that the ownership and control of the material resources of the community are so distributed as best to subserve the common good or that the operation of the economic system does not result in concentration of wealth to the common detriment (Article 39) run counter to their economic interests.
>
> Those who control the means of production try to control the media not only for profit but much more so for perpetuation of power associated with their possession of the means of production. It can hardly be disputed that ownership structure determines the character and style of news report and news display as also editorials and commentaries on the events of the day.

Such an overview of the Indian press is no populist rhetoric. The relentless logic behind it has predictably led the majority to set forth the incompatibility between the press, and essential public utility discharging a vital social function, and its control mechanism which rests in the hands of the forces of status quo.

If freedom of expression has to play its basic role in our democratic polity, the majority Report says, it must be freed from the "steamrolling of the commercial process" so that it may mean maximum amount of freedom of expression for the maximum number of people. When a person's private interest conflicts with his duty to the public, there is every justification in a democracy for insisting that exercise of power connected with his public duty be segregated from his private interest. Justice Frankfurter (USA) is quoted as saying that freedom of the press can be achieved by freeing the press from the "clutches of press barons." The majority was also chagrined because the businessmen owning or controlling big newspapers "have not acted on the advice" of the first Press Commission on creating trusts for their management. So, as the majority put it, "we are obliged to seriously consider the question once again and seek other remedies." Follow the recommendations:

First, a law should be enacted making it mandatory for persons carrying on the business of publishing a newspaper to sever their connections with other businesses "to the extent indicated ..."

Second, a person (including company, trust, etc.) carrying on the business of publishing a newspaper should not have, directly or indirectly, an interest in excess of the "prescribed interest" in any other business, or be in a position of being controlled, directly or indirectly, by any other person or person having an interest in excess of the "prescribed interest" in any other business.

Third, in the first instance, it should be enforced in the case of all persons publishing one or more dailies with the same or different titles in one or more languages, the circulation of which, taken singly, exceeds one lakh copies per day.

Defining the "prescribed interest", the Report says that the aggregate interests of the person carrying on the business of publication of a newspapers in any other business or businessess should not exceed 10 per cent of the total interest involved in the publication of the newspaper. In other words, a newspaper owner should not hold more than 10 per cent of the subscribed share capital of any other business or businesses. While working this out care is to be taken that "associates" of businessmen who could be dummies do not step into the shoes of the principals.

If the divested shares of a newspaper company are not "readily purchased" by "eligible persons" from the "open market", such shares could be acquired and held by an autonomous body or agency to be specified by the legislation till they are purchased.

The Commission is of opinion that a law giving effect to these recommendations could be passed under Article 19 of the constitution. Details are being left to competent draftsmen.

The Commission has also, in the name of fair competition, recommended a price-page schedule (fixing the price of a paper according to the number of pages in an issue) along with a news-advertisement ratio. It has suggested a committee of experts to work out the schedule after going into the economics of the newspaper industry.

Four members of the Commission, Girilal Jain, Editor, *The Times of India*, Rajendra Mathur, Editor, Hindi daily *Nai Duniya*, Justice S.K. Mukherjee and H.K. Paranjape, have disagreed with the three major recommendations, namely, a law to substantially delink the daily press from other businesses, a price-page schedule and a news-advertisement ratio.

It is to be noted here that the recommendations of the second Press Commission on the reform of what may be called the basic structure of the newspaper industry have been more forthright than those of the first Commission. There is, however, one major difference, in that the second Commission has not called for diffusion of the divested shares among journalists and other newspaper workers.

In the absence of the full report it is difficult to discuss and evaluate the viability of some of the otherwise welcome proposals. For instance, who will be the "eligible" persons who may be buying the divested shares of newspaper companies from the open market? Whether or not this proposition carries any loophole which the dispossessed can exploit is to be seen.

Again, the price-page schedule and fixation of the volume of advertisement had proved tricky in the past. Under the Constitution, freedom of expression includes freedom of the press. But press freedom has a large business aspect on the rock of which many a good legislative ship has foundered. Unfortunately, the second Press Commission has not accepted the plea made by some of the professional bodies of journalists to separately enumerate freedom of the press in Article 19 to get over the difficulty of the mix-up of freedom and business.

A publisher, called upon to accept the price-page schedule and the advertisement ratio, continues to enjoy all the freedoms in Article 19 besides freedom of expression and including freedom to practise any trade or business. Although it anticipates difficulties, the Commission merely says that if a publisher claims several fundamental rights in Article 19 in respect of his business, he cannot claim exception from restrictions to which each of the rights is subject. The fact is that the publisher who carries on business would attract restrictions envisaged in 19(4), 19(5) and 19(6). These provisions empower the state to impose "reasonable" restrictions. That word "reasonable" has been the delight of the judiciary and the fly in the ointment of any socio-economic reform.☐

Land Reforms and Small Peasants

SUNIL SEN

On the morrow of Independence the Congress Agrarian Reforms Committee emphatically asserted that land reforms would be the key to "any lasting improvement in agricultural production". In Indian agrarian economy, as the Committee noted, "there is no place for intermediaries and land must belong to the tiller". Sub-letting should be prohibited except in the case of widows, minors and disabled persons. Resumption of land for personal cultivation could be undertaken by those owners who "put in a minimum amount of physical labour and participate in actual agricultural operations". Tenants who had been cultivating land continuously for a period of six years should get occupancy right. The Committee laid much emphasis on the preparation of record of rights by land tribunals with which non-officials should be associated. Instead of nationalisation of land, the Committee favoured individual peasant farming that would be assisted by "a cooperative organisation at least of credit and sale". (CARC Report, 1949).

Looking back, one may say that these recommendations could not be implemented in the face of the stubborn opposition of the zamindars and the landed middle class. In the West Bengal Land Reforms Act, 1955, the individual instead of the family was treated as the unit of landholding, so that the landlords could evade the ceiling by making paper partitions within the family. The Act also allowed the landowners to evict the tenants in the name of "self-cultivation". Predictably, eviction of bargadars continued unabated. In the 1960s concealed tenancy became widespread in West Bengal when "self-cultivated" holdings appeared to be the predominant recorded category. In 1968-69 when the United Front Government was in power, there was a widespread peasant movement which took the form of occupation of "benami" land (land transferred by jotedars to fictitious persons to evade the ceiling provision) and "vested" land. According to the Home Ministry, 346 incidents of forcible occupation of land (totalling about 3 lakh acres) were reported in 1969. The simmering discontent of the bargadars who had to pay 50 per cent of the produce as rent to the landowner could not be ignored. Under the West Bengal Land Reforms Act, 1970, the bargadar's share was raised from 60 to 75 per cent of gross produce, if he supplied the inputs. Since the law provided for eviction on the ground of "personal cultivation" by the landowner, the bargadars were often evicted.

We come now to the land reform measures undertaken by the present Government. First, the bargadar has now secured heritable right of cultivation; even when he is evicted, the aggregate area of his land will not be reduced to less than one hectare. Second, the landowner, resuming land for personal cultivation, has to live in the locality and must cultivate the land himself. Third, the Government has launched "Operation Barga" to expedite the recording of the names of the bargadars. Fourth, the Government is continuing the distribution of vested land among the rural poor. Fifth, landholdings measuring less than four acres have been exempted from revenue assessment, while landholdings of upper-middle and rich peasants are being assessed on progressive rates.

It seems that "Operation Barga" is proceeding slowly; only about 10 lakhs (the number of bargadars may be somewhere between 2 and 2.5 million) have been recorded. What needs to be noted is that the recording of bargadars has made substantial progress mainly in Midnapur, 24 Parganas, West Dinajpur and Burdwan districts (which account for about 5 lakhs, that is, half the number of bargadars who have been registered). Only a small proportion of the bargadars have so far been registered in other

Dr Sen is Professor, Department of History, Rabindra Bharati University, Calcutta.

districts. One may say that the objective of the Government is to perpetuate the barga system that represents pre-capitalist mode of production. The fact is that the bargadars with greater security of tenure will increasingly assert their rights. "Operation Barga", if vigorously pursued in all the districts, will pave the way for further growth of the peasant movement.

The bargaining position of the bargadar will increase if crop share rent is abolished, and fixed rent either in produce or its value in money be established. In the Bihar Tenancy Act, 1938, *danabandi* (produce rent) was abolished, while commutation of produce rent into cash rent was prohibited in the Bengal Tenancy Act, 1928 in order to appease the middle class. In 1946-47 the Hajong peasants who launched the *tanka* movement raised the demand for commutation of *tanka* rent (a fixed quantity of produce) into cash rent; the Muslim League Ministry rejected the demand. It is not clear why the Kisan Sabha that continued to champion the interests of the bargadars hardly examined whether commutation of produce rent into money rent could improve the position of the bargadars.

It is now a commonplace that land ceiling laws were hardly implemented in many States, with the result that only 40 lakh acres of agricultural land vested throughout the country. In West Bengal the Left Front Government showed considerable interest in implementing ceiling laws and distributing land among the rural poor. The Land Reforms Commissioner tells us that 11.76 lakh acres have vested in the state, of which 6.31 lakh acres have already been distributed among 11 lakh beneficiaries. This comes to 0.6 acre per beneficiary. It is noteworthy that the beneficiaries of vested land come mostly from Midnapur (2,72,630), 24 Parganas (1,11,628), West Dinajpur (1,19,234), and Burdwan (75,739), while the number of beneficiaries is 13,497 in Darjeeling, 32,043 in Purulia, 27,625 in Hooghly, 11,161 in Howrah, 37,453 in Nadia, 38,795 in Birbhum. (D. Bandyopadhyay, *Land Reforms in West Bengal,* 1980). Apparently land distribution has made slow progress in these districts. Much of the land has been distributed among the rural poor drawn from the Scheduled Castes and Scheduled Tribes.

What needs to be noted is that the beneficiaries of land distribution (about 11 lakhs) represent a small proportion of the agricultural labourers and bargadars. It seems that the Government with available ceiling surplus land can hardly satisfy the cravings of poor and landless peasants manifested in peasant movements. It is also a fact that the beneficiaries of land distribution have miniature holdings. This question is whether these small farms can at all be viable in a free-market economy. What we witness in West Bengal is the continuing expropriation of small peasants. One may refer to the remarkable rise in the number of agricultural labourers (from 18 lakhs to 33 lakhs) between 1961 and 1971. It appears from past trends that the number of agricultural labourers has increased during 1970-80.

At this point we turn to the problem of rural credit. As the Land Reforms Commissioner tells us: "Mere assignment of surplus land or recording of names of share-croppers really does not help people much unless simultaneously attempts are made to meet their credit needs". The per hectare credit availability is very low in West Bengal (Rs 45), whereas it is Rs 268 in Kerala, Rs 189 in Punjab, Rs 224 in Tamilnadu. What is of crucial importance is that an alternative credit system is being built in West Bengal so that the bargadar does not have to depend on the jotedar for paddy loans. It is familiar that usury helps the jotedar to retain pre-capitalist relations. It seems, however, that the new credit system is still weakly developed; the banking system is yet to be adapted to the needs of small peasants and bargadars. When we view West Bengal as a whole, the agriculturist moneylender who accounted for 28 per cent of the borrowings of the peasants in 1960-61 continues to occupy an important position in the rural economy. The cooperatives which are often dominated by the affluent sections hardly provide a positive institutional alternative to the moneylender. There is, however, evidence to show that the small peasants are now relying on institutional credit in some districts.

Land reform should be viewed as an instrument not only for agricultural growth but also for improving the condition of the rural poor. Erich Jacoby, a distinguished specialist in agriculture, has asked a few questions on the implementation of land reform and its impact on the rural poor. In the fifties and early sixties it was hoped that changes in the agrarian structure would enable the rural poor to move upwards on the agricultural ladder. In the seventies it became evident that agricultural labourers had no chance of becoming owner-cultivators, while small and medium-sized farmers moved down to the level of agricultural workers. Only rich peasants and also newcomers to agriculture like retired military officers, professionals and civil servants, adopting new technologies, came on top. In the rural areas in Asia and Latin America the modernisation of agriculture led to the ruin of small peasants. There had been an increasing exodus from the rural areas, and large cities like Calcutta and Bombay grew immensely within a relatively short period. While the Green Revolution accelerated productivity and growth, it resulted in mass eviction of tenants. As Jacoby tells us, land reform has surely not become obsolete. What is needed is to protect the small peasants from "the increasing strength of the free market forces"; and this can be done if they are organised into "large centrally farmed units which are in a position to harmonise technical advance and social progress." Collective farms will of course co-exist with small farms. The co-existence of these types of farming should be as feasible as the mixed economy in industry and banking in Western Europe. (E. Jacoby, 'Has Land Reform Become Obsolete?' in *Peasants in History,* 1980).

(Thirty-two years ago the Congress Agrarian Reforms Committee, which did not favour collective farms, pleaded for the organisation of cooperative

(Continued on page 34)

DISCUSSION

The perspective of Indian development is fast becoming a matter of crucial concern for the polity of the nation. Taking into account the need for serious discussion of the state of our political economy and the options before the country, *Mainstream* (March 20, 1982) published a contribution from a distinguished observer of the economic scene. This was followed by a response from Dr C.H. Hanumantha Rao, eminent economist, now a member of the Planning Commission (*Mainstream*, April 10). We publish here a contribution from Mohit Sen, well-known Marxist intellectual. The discussion continues, and readers are invited to participate. — *Editor*

Indian Development : Options and Choices

MOHIT SEN

THE contribution by A Student of Political Economy (*Mainstream*, March 20) and by C.H. Hanumantha Rao (*Mainstream*, April 10) are thoughtful and thought-provoking. A welcome and even somewhat unusual feature of both contributions is that even where they are critical of the Left they do not run it down but appeal to it with respect, solidarity, and even a sense of belonging. This only enhances the strength of their criticism.

Nevertheless, while accepting much of their evaluation of the present stage of India's historical journey and some of their criticism of the Left, a critique of their criticism appears to be the appropriate response one should make.

TO BEGIN WITH there is an important point of methodology which one would like the Student of Political Economy to ponder over. This concerns his raplacement of the concept of ruling class by that of ruling group. Particularly as far as post-Independence India is concerned he feels it may not be correct to identify state power with a particular class. "At a particular point of history a ruling group need not invariably and consistently represent a specific class or a permanent interest alliance."

Reference has been made to Gramsci to reinforce the concept of the relative autonomy of the superstructure, including the state, from the base in a given socio-economic system. Actually the concept of the autonomy of the superstructrue was stressed by Marx in his works of concrete historical analysis —the celebrated *Eighteenth Brumaire* for example—and by Engels in his famous letters to Schmidt and Bloch as well as in *The Origin of the Family, Private Property and the State*. In the last named work mention is made of a state power existing without a specific class base and even mediating between classes. The examples given by Engels are those of the seventeenth century absolute monarchies in Europe and of Bonapartism. In more recent times we have had the example of the dual power that lasted in Russia from February to July 1917. A contemporary example could be the character of Maoist state power from around 1966 to today.

It should be noted, however, that these are exceptions, rather transient, unstable, and eventually tilt to one or another class. They arise in highly specific situations of a certain equilibrium in the struggle of classes. An exception proves the rule and should not be substituted for the rule.

The independent Indian state came into existence through a multi-class freedom movement but under bourgeois hegemony. The ideology and the role of Gandhiji and Jawaharlal Nehru certainly cannot be reduced merely to that of national bourgeois leaders. It was much more complex than that. But in the ultimate analysis the mass national movement of which these two were the tallest leaders did put the capitalist class in power. Three-and-a-half decades since Independence has accumulated enough evidence to prove this point. India's ruling class is the capitalist class and has been fairly stably so till quite recently. Its path of development is the capitalist path which the Student of Political Economy himself recognises when he states that the "natural growth of the system" would lead to a situation where "it is the large houses and the monopoly groups that will very rapidly start to dominate the scene."

The specific features of this rule and this path can, perhaps, be traced to the following causative factors:

First, the heterogeneous character of the Indian capitalist class with developing contradictions between the monopoly and non-monopoly and urban and rural strata.

Second, the close inter-connection between the non-monopoly bourgeoisie and the petty bourgeoisie in our socio-economic system with the latter maintaining relative stability and even expanding.

Third, the secular parliamentary democratic form of rule with its inherent pressures towards bourgeois reformism as far as the ruling class is concerned.

Fourthly, the existence and steady growth of the anti-capitalist class and political forces, particularly the Communist movement.

Fifth, the important presence of pre-capitalist survivals, forces of social inertia and reaction linking up with forces of native monopoly capital.

Sixth, the simultaneous development of the contradiction between imperialism and the nation as well as the contradiction between the vast majority of the people and the capitalist path of development, leading to a complex inter-connection between the twin tasks of the national democratic revolution.

Seventh, the growing integration of the revolutionary process in our country and that of the world revolutionary triple-streamed process at a time when the worldwide transition to socialism is on the historical agenda with the world socialist system becoming the decisive factor in world social development.

The thrust of these factors taken together pushes on the broad coalition of social forces to the completion of the national democratic revolution and exerts a very powerful influence on the stability of the ruling class, its system of alliances and forms of rule, including social manoeuvring. It also faces the ruling class with the prospect of an alternative to its rule.

It would be harmfully simplistic to reduce the complexities of our situation to one of competing pressure groups with one as the ruling group led by Nehru in the past and his daughter today.

THE Student of Political Economy does less than justice to the Left when he criticises it for failing to intervene appropriately and effectively both in the days of Nehru's Prime Ministership as well as today. He states that the interest of the Left and the ruling group led by Nehru and then Indira Gandhi largely converged and converge today as well.

Professor Hanumantha Rao writes of national imperatives and regrets that the Left has not done enough to mobilise the maximum possible support for these imperatives, including the followers of the Prime Minister, but has got bogged down in a somewhat sterile controversy over the class character of the Government and on whether to mainly support it or mainly oppose it. He wants the Left to make use of the existing mass support for desired goals and wants the ruling party or its leadership to use the potential created by the Left by its decades of selfless work in organising the working class and peasantry. In his view the Left in India should strive for more ideological Independence, give up reliance on received doctrine and orient its activities more towards trying to solve the day-to-day problems of the masses and build itself up with modesty and patience. In other respects he seems to endorse the points made by Student of Political Economy.

Both the distinguished authors make observations about the present socio-economic scene, its likely development and its desirable development which one would like to examine in the next section. Here one would like to deal briefly with the history and perspectives of the Left, particularly in relation to the dominant or leading bourgeois or bourgeois-petty bourgeois political formation.

The contributions made by the Left during the freedom struggle and in the post-Independence decades would not be denied by the two authors. Indeed one would scarcely be wrong in stating that it is because of what the Left did that they regret that it did not do more and want it precisely to do more and make up the lag in the present.

One would readily admit that, generally speaking, the present independently organised Left, among its other faults, did tend rather to follow wittingly or unwittingly a sectarian line towards other anti-imperialist forces both during the freedom struggle and in the first decade or so after Independence. Theoretical recognition of the central role of the anti-imperialist contradiction was achieved but at a rather abstract level and, therefore, neither given its due priority nor translated into appropriate united front tactics in sufficient measure at all times, including rather crucial times. The necessary struggle for hegemony was misconducted — the just criticism of bourgeois-induced compromise was not at all matched by greater independent and more militant mass anti-imperialist action along with persistent efforts and struggle for the broadest possible anti-imperialist unity. Indeed, the Left failed to emerge as a national hegemonic force. Not that mistakes of an opposite nature, of insufficient demarcation from and struggle against bourgeois or bourgeois-petty bourgeois hegemony and compromise were not also made. There were mistakes of this kind also but sectarianism was the main sin.

At the same time, it is unfortunate that both our authors say nothing about what went on from the other side — the leading or ruling group of Nehru and Indira Gandhi. Despite many substantive and qualitative differences between father and daughter, neither was at all keen on the independent growth of the Left. Indeed, in different ways they were opposed to it.

The 1939 Tripuri Congress events were a pointer. Much more damaging was Nehru and Indira Gandhi's attitude to the CPI-led United Front Ministry in Kerala in 1957-59. It has always seemed to the present writer that what could have been two historical turning points in the destiny of our country were aborted not by the independent organised Left but by those with whom it tried to unite. And it was the weakness of the independent organised Left that it was not in a position to retrieve much from the wreckage.

Much worse, of course, was the manner in which the Congress Socialist Forum was decimated and the Left was attacked by Indira Gandhi when she was at two peak points of her power.

Nor can it be forgotten that in the struggle against the independent organised Left compromises were made and alliances established with forces beyond the pale of anti-imperialism and secularism, with absolutely no pretence at being Left and progressive. Can it be precluded that this will not happen again?

If one wants to sloganise the experience of the independent organised Left it could be "Acquire Strength! Oppose Sectarianism!" The process of the implementation of this slogan would involve the building of the broadest anti-imperialist, democratic unity and constantly struggling to build and even impose such unity through struggle and acquiring strength through such struggle. At the same time, the process of the implementation of this slogan would require sustained and sharp struggle to project the Left as the Left and gain increasing mass support on this basis. This is of special and indispensable importance at the present stage of India's historical development.

THIS brings us to the issue of where we have reached. Student of Political Economy has been very correctly balanced in his appraisal of the strengths acquired as well as the tasks left undone. It would seem that he is also quite right in seeing the crisis of our development not as one of impending doom or breakdown but of a radical change in orientation which would give the dominant position to the big business landlord-multinational combine. This would replicate in our country a combination of the South Korean and Brazilian model of dependent capitalist development or export-dependent development along with extreme accentuation of already existing inequalities. This, in turn, would lead to the destruction of our democratic system and our anti-imperialist non-aligned foreign policy. This is the real danger.

It has to be faced and defeated by building the broadest possible alliance against it and for an alternative path of development. But before we deal with this issue in the next and concluding section of our comment, one would like to bring in some points which our friend seems to have missed.

First, it is quite surprising that no mention is made of what is one of our greatest acquired strengths. And that is our all-round cooperation and friendship with the Soviet Union and other states of the socialist community. This has enormous positive significance for the struggle to continue along the path of independent development and to oppose and defeat the big business-landlord-multinational combine. But to maintain and develop this friendship and cooperation would also require sharp and sustained struggle.

Second, since around 1974 and more particularly since 1980 an increasingly important component of the internal policy of Indira Gandhi's Government has been one which, to say the least, has been of immense help to the reactionary combine and its plans to convert India into a bizarre combination of South Korea and Brazil. This is a cardinal point of total divergence of interest and confrontation between the Left and Indira Gandhi's Government. What is also important is that it shows the considerable influence of the reactionary combine on and within that Government. The ruling group of the Prime Minister and its policies are not exclusively made up of nor serve the interests of the reactionary combine but it is by no means free of it either. But this significant factor has been totally missed by the Student of Political Economy. This is all the more surprising and mistaken after the acceptance of the IMF loan with all its consequences.

Third, a positive and novel feature of post-Independence India is the tremendous growth of the social base of the Left. It is not the poor as such that forms this base but more specifically the working class and the working people, not all of whom need necessarily be below the poverty line, if that is how one is going to define the poor. In particular, the leading force of the Left, socially speaking, is the working class, and it is this class that has grown enormously numerically and undergone positive qualitative changes. It is true that it is still not united on the trade union level and that it still fights chiefly on sectional issues and in a defensive way. It is, of course, politically divided and large segments are even politically disinterested. But there are significant indications of change, especially in terms of a sense of demarcation, self-confidence and readiness to act. What is more, the traditional weapons of the working class — the union and strike — are becoming increasingly popular among those whom one does not generally associate with the working class, that is, policemen and security forces. Not only does this class have social power far beyond its numbers but it is spread out throughout the country, is nationally composed and has revealed its capacity for nationwide action. If there is to be a meaningful coalition against reaction the working class will have to be fully involved and be in the van. This is its responsibility but it is also the duty of the Left to make it aware of this and for all who wish to combat reaction to be aware of it also. But can it be said by anybody that the "ruling group" led by Indira Gandhi is aware of this? Would it not be more true to say that its attitude, on the other hand, is one of suspicion and of keeping the working class tame and tamed?

Fourth, the aspirations and mood of the masses of our country are no longer what they were thirty-five years ago nor even a decade ago. They are not very clear-cut nor unanimous. There is any amount of confusion and fertile ground for creating still more confusion and even dangerous confusion. But there is plenty of sound sense as well — anti-imperialism, secularism, desire for a strong India and democratic freedom have far wider appeal than is sometimes realised. What, however, seems to be dominant or clearly on the way to dominance is the desire for change and change in the direction of greater and more equal prosperity. A new, better and more just life is not only wanted, but the feeling grows that it can be had. How? By what programme? What are the means by which it can be won most easily? On these there are many doubts and at least as many differences. It is the paramount duty of the Left, while safeguarding all the gains of the past and combating reaction all along the line, to articulate and organise this just and healthy pressure for change. It will be betrayal and suicide if the Left does not base itself on this pressure. Either defence of the status quo or joining hands with reaction in the name of fighting the status quo would mean that the Left has chosen to historically abdicate.

THERE should be no misunderstanding about the fact that the role of the Left is sought to be confined to opposing Indira Gandhi's Government, her entire range of policies and her vast mass following. The Left, above all, has to be itself and increasingly come before the people of our country as a force with an identity of its own and with solutions for their problems. And these problems, apart from very important ones pertaining to the livelihood and welfare of the masses, certainly include those of defence of the nation, strengthening its unity, increasing its progressive role in world affairs and moving it on to an anti-imperialist, anti-monopoly and anti-landlord orientation.

For the Left to be supported as such by ever-increasing sections of our working people, mere stridency and false militancy have to be strenuously combated. For the Left to be Left, it has to more and more emerge as a national force, as the spear-head of a national alternative. In the specific conditions of today it has, above all, to contend for the position of the hegemon of the nation.

This would require the strengthening of its unity and expansion of its systematic painstaking work right where the masses live and labour. It would require a qualitative increase and improvement of its ideological work and political propaganda. It would require a style of work and production of cadres and leaders who are taken by the masses as representing their own best traditions and desires. The importance of being and appearing as a force of the clean can hardly be overestimated.

At the same time, for the Left to advance and to shift the country to the Left, the programme it advances and the system of alliances it has to build have to be essentially anti-imperialist, anti-landlord and anti-monopoly, or democratic in essence. And this would surely include support of such policies, measures and pronouncements of the ruling Congress-I as are compatible with or even a part of the alternative national programme.

This is clear enough as far as the foreign policy of the Government is concerned. It is also clear when it comes to issues of national security, national unity and secularism. Extension of the public sector, making it more effective as the occupant of the commanding heights so as to push forward to greater self-reliance and push back the MNCs and the local big business would be most ardently supported in every way by the Left. This would also apply to any other policies, measures or pronouncements directed against reaction. Indeed, the demand for such an anti-reaction orientation would be mounted by the Left not just to "expose" the Government but precisely in order to secure its adoption.

The Left would welcome and readily respond to any efforts made by the Congress-I or any sections of it to move the Government in the desired direction.

Leave alone issues like the above-mentioned ones, even on other issues on which there would clearly have to be conflict and confrontation between the Left and the Government, the former's consistent endeavour would be to draw into such struggles as much of the vast mass following of the Congress-I as possible. The Student of Political Economy is quite right in pointing to the immense popular mass following of Indira Gandhi among the poor and down trodden working people though, as he would admit, this is a fluctuating following to an extent and it has its inherent limitations when it comes to moving into action, being still somewhat akin to the "dumb millions" of Gandhiji's visualisation, waiting for their tears to be wiped rather than with blazing eyes. It is true that, apart from the much smallar mass following of some secular Opposition parties, these masses are, by and large, followers of and, indeed, part of the progressive heritage of the Congress and closer in their consciousness to the masses following the Left parties. It is also true that in approaching them appropriate account would have to be taken of their loyalties. But there should be no misunderstanding if the Left seeks to win over these masses to its understanding of problems! But the stress from the Left would certainly be on moving together, as we are, into joint activities of differing kinds and winning together our common objectives. Experience of such joint activity would convey its own lessons and bring about consequential realignments.

As part of this endeavour one would like to conclude with a proposal. The Student of Political Economy and C.H. Hanumantha Rao could help the Left as well as what they call the "ruling group" led by the Prime Minister if they worked out, by themselves or in cooperation with others, the concrete details of the programme of national economic advance as an alternative to the "South Korea-Brazil model". The evolution of such a programme would itself be a form of action and a test for all concerned and could be a prelude to still more worthwhile joint endeavours. ☐

Development, Technology and Education

BIMAN SEN

"DEVELOPMENT" is a very complex concept having a wide range of meanings, from unfolding of knowledge to a stage of advancement. It has different meanings for different groups of individuals. For a cosmologist, it means gradual unfolding of knowledge of the Universe. For an evolutionist it means evolution of life in this world. A psychologist may mean it as the process of mental development of an individual. A demographer interprets it as a movement of population from rural to urban areas. A political scientist may identify it with changes in political institutions. For a social scientist, development is primarily related to transformation of social institutions. An economist tends to equate development with modernisation and economic growth. Whichever way one may interpret development, its prime objective remains the same, namely, continuous improvement of the quality of human life and knowledge.

Viewed in the context of a country, development is an instrument of continuous changes in the socio-economic environment which is ultimately responsible for cultural transformation of a group of people constituting a 'nation'. It cannot be viewed in isolation but is an integrated system which follows a definite pattern and has dynamics of its own, guided by certain principles and rules.

Historical evidences show that economic growth forms the nucleus of all development. Social changes and cultural transformation are largely byproducts of economic development. However, the socio-cultural milieu prevailing at a given time acts as an impediment to rapid economic growth and this, in turn, delays the natural process of progress in a country. If the resistance is formidable, ultimately the society may have to face a forced change, popularly known as "Revolution".

If one analyses the development of man from mere animal existence to the modern complex society, it will be clear that economic growth has been the major factor. Major tools responsible for the change, put in proper sequence, are energy, agriculture, metallurgy, machine tools and so on, till one comes to modern sophisticated tools like electronics, nuclear devices, etc.

The outstanding achievement of the first man was discovery of fire, which differentiated man from other animals. In fact, one may say human civilisation began with fire — the first man-made form of energy. Since the discovery of fire, the evolution of various methods of producing energy may be considered the story of evolution of human society from animal existence to modern systems. Today, the index of economic progress and development of a country is determined by the index of energy consumption. According to the energy index available some time back, yearly per capita consumption is of the order of 2700 KWH in India against about 114,000 KWH in the USA, and the world average is about 20,000 kilowatt hours. That is perhaps why India is one of the poorest countries in the world.

In spite of the discovery of fire, man essentially remained an animal, with hunting for food as the prime occupation, till he discovered agriculture to produce food without difficulty. With the discovery of agriculture, man discarded his nomadic existence and settled down in a fixed habitat creating his own environment. This change was actually a quantum jump and not one of evolutionary, continuous change.

With the advent of agriculture including animal husbandry, the economy of human society underwent a drastic change from collection of food for survival to production of food according to need. Quality of life improved. The new situation released a surplus labour force which was utilised for other economic and social activities, like development of arts and crafts, construction, development of metallurgical industries, and so on.

The next drastic change in human society through a quantum jump was brought about by the Industrial Revolution which laid the foundation of the technological civilisation.

In the beginning of civilisation, the main energy source was wood — and it still remains the main source of energy for most developing countries. Gradually man's search for new sources of energy brought fossil fuels. Coal became the first fossil fuel to be used as a source of energy, and it soon became the instrument of industrial revolution. With the discovery of oil, it became a strong competitor to coal because of its low production cost and convenience of transportation. Gradually, with the march of time, other sources of energy like hydel power and nuclear power started establishing their position in the usable energy source spectrum —and this stimulated the growth of Science and Technology, the tools of economic growth and social progress.

Whether it is fossil fuel or nuclear fuel, since the sources are non-renewable and non-recycleable, they are not inexhaustible. Therefore, ultimately, if development has to be sustained, man will have to adopt renewable and recycleable energy sources like solar power, wind-power, hydro-power, biomass, etc. However, all energy sources are derived from solar energy stored in one form or another.

In the ultimate analysis, one may foresee that the choice from the 21st Century onward will have to be, by force of circumstances, renewable and recycleable energy sources. Of course, the choice will finally depend on the type of society mankind

The author is Executive Director, International Educational Consortium.

will adopt. Perhaps biomass energy source, over which man will have supreme control, may become the major source. However, during the transition period each country will have to adopt a proper mixture of non-renewable and recycleable energy sources according to its capability and the purpose for which they are needed. Ultimately, once again agriculture and forest products will be the main resources for man's survival. They will cater for all the needs of mankind — food, energy, etc.

'DEVELOPMENT' is closely linked with material prosperity through economic development which, in turn, brings about social change and cultural transformation. Major factors responsible for rapid development in a country are: (1) Capacity to mobilise capital. (2) Capability of harnessing natural resources. (3) Capacity to exploit science and technology to the best advantage. (4) Capability to develop human resources. Of these, the most important is development of human resources, as man is ultimately the nucleus of development. One single factor which has contributed to man's outstanding progress is his urge for good living. Man's aspiration for better and better conditions of living is the prime motive force behind all development.

In the past, the concept of accumulating wealth for good living was by exploiting others; and such wealth was enjoyed by only a few. The Industrial Revolution introduced a new element in the concept of production and distribution. It showed how man's own efforts can generate wealth without exploiting anyone and can be shared by all. In fact, the Industrial Revolution was the beginning of an altogether new era, the beginning of technological civilisation.

The Industrial Revolution, however, brought with it other problems. The nations which were the main beneficiaries of the revolution started exploiting world resources indiscriminately for their own benefit. Never before had anyone thought that development was an integrated system affecting the entire humanity and its environment. It was only after World War II that there has been a mass awakening regarding environmental protection to save the world from man-made pollution and ecological imbalances which are gradually taking it towards total destruction.

After the energy crisis created by the petroleum producing countries, there has been general realisation that development without conservation is suicidal for mankind and that the world resources need to be considered as common property for total development of mankind as a whole and conserved for effective utilisation without wastage.

Development of any particular aspect of human activity cannot be considered in isolation. Each sector is related to the others. One of the main reasons for the failure of Indian development strategies so far is perhaps the lack of understanding of the interdependence of various sectors and of the fact that development follows a sequential pattern with relative/predetermined priorities particularly at the initial stage.

For a clearer understanding of how complex and integrated the development system is, a schematic diagram of a development system in relation to national objectives and aims is given here:

It may be observed from the diagram that for economic development, there is need for rapid industrialisation along with development and modernisation of agriculture. They are like Siamese twins; one cannot be sustained without the other. For healthy growth of both, well-developed infrastructure by way of energy, education, transport, roads, etc, is needed.

Economic development can be quantified in terms of growth of agricultural production and industrial outputs. The aim of such development is to optimise agricultural production through increased productivity by application of science and technology and industrial output through expanding activities by diversification, improving techniques with proper application of latest technology and exploiting natural resources to the best advantage. For balanced economic development, there is need for modernisation of agriculture and rapid industrialisation simultaneously with building the infrastructure. Development of social services except education comes next in priority. However, education, particularly higher education and research, should be given the highest priority from the very beginning, as it is responsible for supply

of trained manpower which is the most vital input for any socio-economic development.

Historical evidence shows that there is a natural gestation period for the take-off stage of the economy for self-sustaining growth. The gestation period varies according to the socio-cultural milieu and political will of a country. Most of the industrialised countries reached the take-off stage before the end of the 19th Century through evolutionary process. Japan took the least time, about 12 years, and the longest was France, about 30 years. However, India, even after 30 years, has not reached the take-off stage because of its planning strategies which failed to observe the rules and sequences of planning due to conflict between tradition and modernity, forgetting that we are not in the Middle Ages but in an age of space and nuclear technology. The weakness is reflected in all planning documents. Planned economic growth needs judicious use of resources in correct sequence, together with an efficient implementation machinery and monitoring system. The strategy of development needs to be formulated keeping in view the compulsions and constraints a country has to face and not on emotional or traditional heritage.

FOR formulating strategies for future development in India, one has to examine first the major constraints and compulsions faced by the country. There are two major constraints, which should determine the development strategy for this country; one is the large population with high growth rate and hardly any hope of controlling this to zero growth-rate within any reasonable time (it may take 50/100 years), and the other is the limited extent of land to sustain this huge population which may reach about 1000 million by 2000 AD and with moderate growth (reduced) about 1,500 million by the middle of the 21st Century with a possible drop in rate of growth.

The total area of land in India is about 328 million hectares, of which about 29 million hectares are barren and unusable, leaving only 299 million hectares to sustain about one billion people at the beginning of the 21st Century. The USA's total land under forest is 299 million hectares, which is about 30 per cent of the total land with a population of only 232 million. Due to scientific management, production and growth of forest wealth is much higher than harvesting of forest in the USA. In India, of 299 million hectares, only 65 million hectares are under forest, less than 20 per cent of total land area. Net area under cultivation is about 140 million hectares; about 13 million hectares are permanent pastures and grazing land (total 153 million hectares for agricultural use). India can hardly afford to spare so much land for agriculture and pastures. For ecological balance alone, India needs about 110 million hectares under forest against 65 million hectares today. One of the reasons for drought and flash-floods in recent years is indiscriminate cutting of forests for cultivation. One should not forget that India has long coastal and mountain areas and fourteen major rivers which need large forest areas for protection from soil erosion.

Taking a futuristic view, in order to meet part of its energy needs and use of forest products for other purposes, India should have, by the turn of the century, at least about 60 per cent of land under forest, thus leaving hardly 105 million hectares for agriculture, pastures, living accommodation, infrastructures, industrial needs, etc. Therefore, India, by compulsion, cannot afford to maintain the luxury of the present system of villages or traditional methods of agriculture or labour-intensive industry. India's development strategy should be reoriented to highly capitalised agriculture including massive development of animal husbandry and marine products, large-scale urbanisation with three-dimensional expansion to meet the challenges of the 21st Century. There is still time to correct the planning strategy and make it more scientific and pragmatic. This can be achieved by rapid industrialisation, by adopting highly sophisticated up-to-date scientific and technological methods involving economy in energy consumption, extremely high productivity through scientific management with special emphasis on large-scale development of metallurgical industry, heavy chemicals, machine tools, etc., and improving rapidly the infrastructure and energy production.

The direction of industrial development in India will also depend on another compulsion forced on it, due to geopolitical situation in the region in particular and the global situation in general. India, being part of the total global system, cannot ignore recent developments in the region and in the world. The present situation demands that India should develop highly sophisticated industry needed for self-reliance and develop nuclear or space capability, apart from meeting defence requirements.

According to UNIDO, today the entire developing world including India shares only 9 per cent of the total industrial production of the world. The UNIDO has fixed a minimum target of 25 per cent of world industrial output by the developing countries by 2000 A.D. This will need tremendous efforts on the part of both developed and developing countries working together for a just solution.

Because of large-scale air and water pollution problems and depletion of natural resources, a new dimension has been added to the development strategy; that is conservation. The 21st Century will be the age of development with conservation which will need a highly scientific approach to development, with a very efficient technological base.

Nature has endowed every animal except perhaps man with some physical qualities to protect itself from others and to survive against normal environmental hazards. Many species of animals have become extinct through ecological disturbances. But man has been gifted with a scientific mind, a keen sense of observation, power of analysis and logic and application of knowledge and experience to his best advantage to survive in this hazardous world. This quality distinguishes man from other living creatures and enables him to conquer nature.

The unique gift which gave birth to Science made man the master of nature and environment. Technology is the application of science for practical use in the service of man. Till the Industrial Revolution, technological developments were based on the use of hand tools. Productivity was low and dependent on the efficiency of an individual. Production was limited, so distribution was restricted. Although the Industrial Revolution laid the foundation of a new era of science and technology, the hangover of the past was so strong that only a few benefited from it. Soon after World War I, the pace of development became faster with the introduction of the new technology of mass production. In spite of some rapid changes in technology, however, changes in the socio-economic structure of most countries were marginal and the pace of global development was not perceptible. This situation continued almost up to World War II.

The Second World War changed the picture completely. With the explosion of the atom bomb, the old values changed. Even small countries started asserting themselves. Technological development has created such conditions today that only two alternatives are possible, either total destruction of mankind, or human society should live in prosperity and peace as one entity based on the common heritage of man.

Rapid scientific advancement and technological development have created many problems. It has changed the structure of employment which is worrying many as it may bring about large-scale displacement of labour. This seems to be an imaginary fear in the minds of those who are thinking on the basis of old concepts of employment, forgetting that the new situation needs a new solution and approach to the concept of employment itself. Employment can no more be related to 'man-day' or 'man-year' of work but should be related to 'man-production' per day. That is, with the increase in productivity due to introduction of new technology, the working hour per worker needs to be reduced keeping the man-production rate the same, to be determined according to technology used. This is at present being followed in the aviation industry, where with the introduction of faster and faster planes, the total flying hours of a pilot have been gradually reduced, though flying mileage per month has been increased. Sophisticated technology will not only create conditions for generating more employment but will increase production and relieve man from the stress and strain of work. It will also create conditions where man will be able to get more leisure. This, in turn, will contribute to more creative work for improving the quality of life. One can visualise that the 21st Century will be the beginning of a new age of creativity.

THE main malady of Indian planning is its failure to appreciate that the old order changeth, yielding place to the new. Thus, India has been trying so far to marry tradition with modernity. Thereby, it has accepted modern institutions but has failed in working such institutions.

The major obsessions born out of traditional thinking in India are: (1) Since India is basically an agricultural country and the majority of its people live in villages, the country's salvation lies in the development of the rural economy. This has created an artificial barrier between rural and urban development. (2) The bogey of unemployment: a general view seems to be that automation and modernisation will produce surplus labour force. Therefore, labour-intensive development projects should be encouraged, forgetting that in the modern world, *the fourth dimension, time, is most important.*

These obsessions born out of no logical foundation are responsible for the present general condition of the country. If the planners and politicians would have analysed world experiences and taken bold steps in time, India's economic situation would have been different, and by now, India would have been one of the richest countries.

It is time for India to discard labour-intensive methods, which are uneconomical and time-consuming — in the case of both agricultural and industrial development. We should adopt the latest technology in both areas. Up-to-date technology does not throw out labour but creates more and more jobs of a sophisticated nature. It not only saves time but ultimately saves money, thus creating conditions for better investment return and quicker attainment of objectives. Ultimately major employment will be created in the services sectors including education, health, infrastructural services, etc., which need surplus wealth that can be created only through modernisation of agriculture and rapid industrialisation. Large-scale employment should be created in afforestation programmes which are urgently needed for saving the country from desertification and preventive maintenance which can save millions of rupees for better investment.

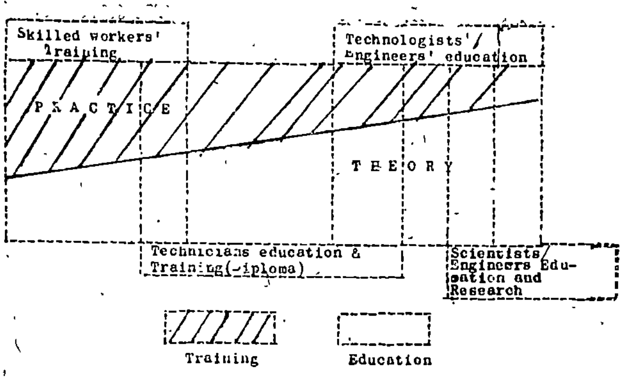
In the present circumstances, the highest priority should be given to heavy industries like steel, cement, other metallurgical industries, fertiliser, heavy chemicals, etc., and building proper infrastructures. Taking into consideration the regional geo-political situation, India's present economic situation and the future society which is taking shape, India should now prepare the base for entering into a highly sophisticated age of technology in the 21st Century. High priority has to be given to developing and manufacturing sophisticated scientific goods. It is high time for the country to prepare itself to develop its own solar technology, space and nuclear technology, agricultural technology, etc.

India's greatest asset today is its sophisticated manpower, that is, highly capable engineering and scientific manpower. It is the third country in the world in producing such manpower; what it needs is to gear up the development system to utilise them and update its educational system to meet future challenges.

ALL human activities or actions are inter-related in the highly sophisticated age of science and technology. Education is responsible for development of human resources which are the most vital and essential input for all development activities in a country. Modern education system is a sophisticated learning process developed over centuries for acquiring knowledge through a scientific system based on documented information and sequential method of transfer of skills and learning. However, modern education is only one of the processes of learning.

Prior to the invention of language, the learning process was based on observation of natural phenomena and behavioural patterns of other organisms and the experience gained through continuous practice. Even in this age of science and technology the process of learning through observation is still in vogue. The invention of aeroplanes, submarines, etc., is the best example. With the advent of language, gradually man learnt to transfer his personal experience to the next generation — a process involving rigorous training and practice. With the invention of writing and keeping records, man entered the realm of a highly sophisticated communication system. Man's success in the field of science and technology is due to this ability to develop a scientific communication system in the form of records of all experiences and experiments responsible for continuous expansion of his horizon of knowledge.

The Industrial Revolution introduced a new element in the concept of production and distribution, as already mentioned. The old process of learning skills through observation and practice became too time-consuming to keep pace with technological development. The learning process needed fundamental change. To understand machines and their working, knowledge of science and mathematics was essential. Thus, the concept of modern technical education system was born. The new learning process was institutionalised towards the end of the 18th Century through the introduction of a regular education component in the training system. Since then, with industrial development, the concept of technical education underwent continuous changes. However, the basic structures remained more or less the same. Practical training at the institution level remained the backbone of the learning process till the end of the first World War (1914-1918). Gradually, after that war, the emphasis shifted more and more from the training of the educational component in the total learning process. Major changes in the concept of technical education came after World War II (1939-1945) which reduced the time-lag between scientific invention and technological development. One may represent the total learning process in the field of technical education as in the following diagram.



Skilled workers' Training
Technologists'/ Engineers' education

Training
Education

Production of scientific and technical manpower which is the key to economic and industrial development in a country; needs a long lead time. It takes about 10 to 15 years to develop highly-sophisticated skilled manpower like engineers, research scientists, managers, etc. The type and quality of such manpower depends on the basic education and training given in the technical and scientific institutions. Therefore, for scientific planning of technical and science education, there is a need for futuristic studies of requirements of technical personnel in terms of number, types and quality which, in turn, needs proper perception of the probable industrial and socio-economic environment of the country in the future. Past experience and the present situation may give clues to failures and shortcomings but can hardly give any solution to the problems and challenges of the future.

In planning any educational system in proper perspective, one should not forget that science and technology are universal and not a monopoly of a set of countries. What differentiates developed from developing countries is the capacity to apply science and technology for improvement of the quality of life. What a developing country lacks is ability to develop and utilise its human resource to the best advantage due to ineffective and inefficient education system which tends to develop in isolation. Since science and technology are universal, the types and quality of manpower required for their development and application to economic and industrial growth cannot be basically different. In addition, one should not forget that the world is moving toward unification of human society and that development of International understanding toleration should be the basic objectives of education in future. Therefore, logically, the basic structure and content of technical and scientific education cannot differ very much from country to country. Unless this is clearly understood by the developing countries, the gap between the developed and developing world will never be reduced but may widen.

In this highly sophisticated age of science and technology, it has been almost universally accepted that initial schooling should be at least of twelve years, before any student is permitted to enroll at the tertiary level of education (university level). Greater emphasis should be given to development of communication system at all stages of education. Science and mathematics should be compulsory for all school-going students.

The twelve years of schooling must be divided into basic foundation education, popularly known as primary education, and transitional education, known as secondary education, depending on the needs of a particular country because of its specific environmental situation. Transitional education should be at least for two years and diversified as it has a dual function, as a passport to the tertiary level and for entry into the world of work.

In planning a proper system of education, there should be a built-in mechanism which can provide life-long education to an individual to upgrade knowledge and skills through provision of either part-time or collaborative system of education.

Higher education to serve its purpose should be planned on the basis of overall policy for long-term development of the country. The contents and needs of higher education should determine the quality, type and standard of secondary or transitional education at school level which, in turn, determines the contents and types of foundation education the country should have. However, the essential objective of education — development of total personality in an individual — should not be missed at any level. This throws a very difficult challenge to the education planner as he/she has to satisfy twin national needs — on one side to satisfy the fundamental right of access to education of every individual, and on the other, to satisfy the national need of trained manpower for economic and industrial development. To satisfy the first need, the educational system should be flexible and environment-based, but to meet the second need, a well-balanced formal system of institutionalised education comparable to developed-world standards is to be designed. Therefore, at the foundation stage, there should be two parallel streams — a formal institutionalised stream to meet the needs of trained manpower for industrial and national economic development, and a non conventional system to meet the universal demand of education to improve quality of life through wider access to modern knowledge and information. However, there should be provision for multi-stage entry from one system to the other in order to tap the best talents of the country.

THE technical education system developed in India after Independence was based on the then prevailing needs of industry which was basically dependent on foreign know-how, manufacturing machinery under licence, fabrication and maintenance activities. These were of a routine nature. There was hardly any R & D activity in industry. Therefore, no serious trouble was faced by the technical education system. It served its purpose to the satisfaction of the authority promoting or using such education. However, whenever any new situation arose, special training programmes had to be arranged for training technical personnel either here or abroad Such arrangements are time-consuming and costly. That is one of the main reasons why, after 30 years of planning, the country still has to depend on foreign collaboration for manufacturing sophisticated equipment. In some cases, the country has to depend on collaboration arrangements even for maintenance or servicing, although India has a well-organised infrastructure for promotion of scientific and technical education.

Technical education should be tuned to the changing requirements of the industries and to meet the challenges of the future. For planning technical education on a scientific basis, the planners should have a clear perception of future needs on the basis of national commitments both internally and externally and studies of existing trends of deveolpment in a continuously changing industrial and economic environment. Transitional phase of development of technical education would take care of existing technological needs.

India has already opted for high technology oriented development. It has no option but to do so for mere survival in the fast-changing global geo-political situation. The country has entered in a big way highly sophisticated technological areas like aerospace technology, computer technology, satellite technology, etc. It is also committed to strike a balance between conservation and development and to solve the problem created by the energy crisis. In addition, India will have to enter into new fields like genetic engineering, human engineering, social engineering, etc. These will need large-scale expansion of R&D activities and post-graduate education. Technical education planners are now faced with a peculiar dichotomy, as these sophisticated technologies demand on the one hand highly competent narrow specialists, and on the other scientists and technologists with inter disciplinary knowledge and competence.

These sophisticated technologies need people with knowledge of miniaturisation, computerisation of information/its application and retrieval, new materials, economisation of energy consumption, ecology, environment, etc. Unless the future engineers, technicians, scientists acquire basic knowledge of all such matters, it would be impossible for them to function effectively. Electronics and communication, the core discipline in the future, will form the bedrock on which all technologies are likely to be developed. In addition, the social roles of engineers and scientist are fast changing. They are gradually assuming leadership of the community.

From the trends of technological and scientific development, one can visualise that in future, manual skills will be taken over by machines except in the field of maintenance. It may also be visualised that in future, replacement of machines may be cheaper than maintenance. Moreover, machines will go obsolete in no time. Since the thin line dividing scientists and technologists is vanishing fast, in future (21st Century) one may visualise the technical manpower spectrum and their training components as follows:

The skilled worker may be replaced by operators with a high degree of scientific and mathematical knowledge who can be trained in the industry only with good higher secondary education (10+2 system).

Taking everything into consideration, it is felt that there is urgent need for reorientation of existing technical education to meet future needs. This can only be achieved through a new revolutionary approach to the planning of technical education. This will need complete overhauling of the curricula and evaluation system and methodology. The syllabi of all technical courses should contain study of basic electronics, knowledge of alternative energy sources, computer programming, material sciences, pollution, ecology, etc. Consequently teaching of physics, chemistry, mathematics will have to be strengthened. Since curriculum time is not elastic, it would be necessary to drop unnecessary frills in the present syllabi to make room for essential

Education components

inputs. Use of library should be an essential part of the learning process. In short, there is need for intensive investigation and research in the field of technical and vocational education.

As far as possible the first degree course should be broad based, with a small peak of specialisation at the terminal stage. Actual specialisation should be attempted at the master's level. There should be large-scale expansion at the research level. At research and post-graduate levels, there is need for mixing science students and engineers. At the technician level, narrow specialisation should be avoided. Such specialisation should be introduced at the post-diploma level as part of continuing education after an individual has spent about three years in employment.

Changes suggested in the curricula of the technical courses will demand consequential changes in the secondary education system, particularly teaching of languages, sciences and mathematics. It is felt that till the deficiencies and weakness of the secondary education system are removed, the duration of degree courses in engineering and technology should remain 5 years and should not be changed to four years. Recent investigation shows that higher secondary school performance is a bad indicator of likely performance at the higher technical education stage. Modern physics taught at the first year of the five-year integrated engineering degree course is a better indicator.

There is need for continuous evaluation and updating of the technical education system. With all the facilities so far created in the field of technical education, India has not been able to produce the proper type and quality of scientific manpower to become self-reliant. However, when students after finishing their education in the country go abroad, they are able to compete with anyone from outside, after proper reorientation training either at post-graduate or research degree stage. Hardly any serious research has been undertaken to find out the shortcomings of our technical education system although many opinions have been expressed by various expert committees. In recent years, some individual efforts have been made to initiate researches in technical education by a few progressive institutes. Such researches, are however, normally restricted to services research, that too mainly 'action-research' to improve class-room teaching or evaluation system. No research has so far been undertaken on the gap in the existing system of technical education and the changing needs of the country. This is one of the reasons for our weakness in R & D activities.

It is felt that at least 1 to 2 per cent of the total provision for development of technical education should be spent on relevant research. The major role has to be played by the higher technical institutions, specially IITs and Technical Teachers' Training Institutes.

Since hardly any attention is given to research in technical education, the institutions specially higher technical institutions are drifting away from their objectives. Some of the IITs and other institutions, instead of concentrating their energy on developing high technology and manpower for research and development, are diverting their energy and funds to so-called development of rural technology forgetting that science and technology do not differentiate between rural and urban development. It is more a question of adoptation of technology in various environmental situations. In fact, the need for technology in rural areas could be better met by a polytechnic than by an IIT which should devote its time to developing higher technology.

The higher institutions of learning in the field of science and technology, instead of frittering away their energy and funds on fancy activities like rural development or routine research which could be taken care of by other institutions, should concentrate on the objectives for which they have been established. These institutions should provide leadership in the field of technical education and research of a fundamental nature and assist the country in improving the standard and quality of technical education in particular and education in general. Institutions of higher education should play an effective role in the following major areas:

(1) To provide an effective and efficient model of under-graduate programme for technical education through continuous evaluation and assessment to meet the challenges of the 21st Century keeping in view global technological and scientific changes, and to make the technical education system a dynamic one with built-in mechanism for quick change.

(2) To provide adequate facilities for R & D activities keeping in view the country's technological needs in the 21st Century.

(1) and (2) will need the formulation of a new concept of technical education, curricula, approach and methodology of teaching and evaluation, etc., and research programmes with long-term objectives like alternative energy source, economisation of energy, space technology, material technology, genetic and human engineering, etc.

(3) To provide adequate facilities to develop teaching personnel for other institutions with a view to improving the standard and quality of degree education.

(4) To develop appropriate educational materials and aids for technical and science education not only for engineering colleges and technical institutions but also for secondary schools.

(5) To develop literature and aids for popularisation of science and technology so as to develop scientific temper in the country for effective utilisation of science and technology by the people.

Future leadership in all spheres of life will rest with the technical and scientific manpower, if the world is to survive. Thus technical institutions have a great responsibility in shaping the world of tomorrow. ▣

Income-tax Payers

ARE YOU AWARE

A Grievance Cell is there in the Central Board of Direct Taxes to attend to your complaints promptly? The cell is functioning under the direct control and supervision of Chairman. He personally acknowledges petitions and ensures prompt redressal of tax-payers' grievances.

If you have any legitimate grievances concerning Income-Tax Wealth-Tax/Gift-Tax Estate-Duty about undue delays in :

- **GRANT OF REFUND**
- **GIVING EFFECT TO APPELLATE ORDER**
- **CLAIM FOR RECTIFICATION**
- **ADJUSTMENT OF PRE-PAID TAX**
- **COMPLETION OF ASSESSMENT**
- **TRANSFER OF ASSESSMENT RECORD**

Please address your petitions direct to:

Shri Jagdish Chand,
Chairman,
Central Board of Direct Taxes,
Room No. 148, North Block,
Central Secretariat,
New Delhi-110001.

Note : To facilitate action on your petition, please quote your Permanent Account Number alongwith your name and address, assessment year and the circle ward in which assessed.

E.E.C. Search for Unity

RAMNATH NARAYANSWAMY

IN a ceremony at Brussels recently, the partnership of the ten West European countries that make up the Common Market commemorated the twentyfifth anniversary of the European Economic Community. The EEC has reason enough to outline some of the accomplishments that justify its existence. But the present recession that looms over the Continent has not only brought about greater emphasis on collective unity but has begun to cause regrets about some events in the organisation's past and increasing worries about its future.

This is evident from a cursory glance at the reality that has replaced the lofty dream of social and political cooperation envisaged during the signing of the Treaty of Rome 25 years ago. The Community is now involved in bafflingly obscure and endless disputes over butter, chicken, sheep or wine. As Gaston Thorn, president of the EEC's Permanent Commission observed: “The Community is lurching from wine wars to turkey fights to budget disputes. It is involved in esoteric squabbles about money. Its identity is slipping away. There is lack of direction, a sense of powerlessness.”

has to be an immediate start on laying the founda-

A closer look at the problems facing the Community confirms this impression. Britain is questioning its returns for its contribution to the communal budget and has been threatening to block the agricultural programme if its demands are not met. Greece, the latest to join the EEC, is demanding a renegotiation of its entry agreement. Greenland, a Danish territory with autonomy status, wants to pull out. France, ignoring the Community's byelaws, continues to block the importation of Italian wine. Likewise, French brewers have been complaining of West German import regulations on the quality of beer, making it impossible for the former to export to the latter. Even within the Community, local opinion seems to be increasingly in favour of pulling out. In a referendum conducted in Norway in 1972, 53 per cent were in favour of rejecting membership and there are reasons to believe that the figure will be much higher today. The situation is not very different in Britain where contribution to the Community's budget has become an issue of central importance. In other words, it is no longer the grander notion of a Community that today matters but who pays what and who gets what.

If the present tendency continues, the economic and social situation within EEC countries will continue to deteriorate, and if the proceedings of the recent EEC summit that coincided with its twenty-fifth anniversary are any pointer, the prospects seem none too encouraging. The resulting priority accorded to new investments at the summit as a means to deflate the rise in unemployment was therefore hardly surprising. According to official estimates, unemployment among the ten will rise for the ninth consecutive year in 1982. (from the present 10.7 million to 11 million by mid-1982.)

Also, the conflict between France and Britain over future British payments to the EEC budget continues. The conflict centres not only on future British payments but also on the terms of the compromise proposal drafted by Gaston Thorn and Leo Tindemans, the Belgian Foreign Minister, which aims to reduce British payments up to five yars. The main opposition to the proposal came from the French who have made it clear that the compromise plan cannot be accepted as a basis for discussion and stressed the need to adopt a firmer and more stringent policy in applying industrial and trade policies in respect to Japan and the USA.

The Falklands Islands crisis which has come as a surprise to most EEC members is also bound to contribute to the uncertainty among members on matters of policy. According to its own figures, the ten EEC countries had a trade surplus of about 250 million pounds with Argentina last year, and although there has as yet been no report of an impending trade boycott, British initiative in the matter will doubtless prevail. The West Germans have begun to review the delivery of six German submarines for the Argentinian navy, following the escalation of the Falklands crisis. Internally, although Greece has clarified that it is not withdrawing from the EEC, it has by no means withdrawn its objections. It has submitted a memorandum to the EEC which demands that Greek industry be exempted from EEC rules governing anti-trust and competition behaviour within and outside the Common Market and the memorandum contemplates steps such as the “granting of development incentives, provisional and regulated protection of newly-created industries and granting of export aid for small and medium-sized undertakings”. If negotiations on these fail, the Greek Government has not excluded the possibility of reviving the threat to call for a referendum aimed at withdrawing from the Community.

Externally, the EEC has been compelled to strain its relations with Turkey as a result of revelations of human rights abuses in Turkey, and the resulting friction has come to threaten the EEC-Turkey association agreement. The dispute followed European complaints of the dumping of Turkish cotton yarn in the Common Market to which the latter responded by imposing a 12 per cent duty on cotton imports while the Turkish Government is contemplating import penalties on several EEC steel products worth about 150 million pounds a year.

Closely related to the budget dispute, is the continuing controversy on 1982 farm prices of which Britain and France seem to be the major protagonists. The initial proposal to raise the payments to the Community's eight million farmers by 10.5 per cent under the system of guaranteed farm prices this year has met with considerable opposition from the British who have been demanding rebates on their large payments to the Community's budget and ascribe the high spending on agricultural subsidies to the disproportionate size of its payments to the Community. A similar sentiment was echoed by West Germany. The French, on the other hand, have been calling for a more hefty increase to compensate the losses incurred by farmers last year, and have been joined by Italy, Ireland and Greece.

The EEC today is not what it was meant to be. Gone is the federal notion of a United States of Europe embodied in the Treaty of Rome. The idea is not even mentioned any more. Despite some of its economic successes, the experiment has proved to be a political failure, and the latter threatens the peace of the former.

'Two Better Than One'

ANJALI DESHPANDE

'Two is better than one' says an Amul advertisement and for naive people like us who might take it to mean two packs of butter, the meaning of the words is made clear by a painted hoarding in which our celluloid Mughal-e-Azam is shown smacking his lips in a truly gluttonous manner while the coy second bride offers him an insignificant lump of butter with all the satiated expression of offering herself on a platter and the first wife beams in delight at the two without letting go of the masculine arm she leans upon.

Two wives are better than one. And why not? Since many a matinee idol is taking another wife, sometimes clandestinely, sometimes not so discreetly, it is so. If they weren't so sure they wouldn't be squandering all that cash earned by sweating under glaring lights on maintaining two households, although income-tax sleuths know they have much to spare. After all they shoulder the responsibility of leading the unthinking millions into aping them blindly.

For having had the luck of professing the only true faith, the Muslims of the land are allowed to take two of those twos for a double treat. All this hullabaloo about the hush-hush second wedding of a tragedy king of the screen is definitely in bad taste. It violates the hallowed privacy of an individual of which anyway there is always a dearth. If the tragedy is to his bedroom it is his private business. The breed of progressives, who never can be kept at bay, are flying at his poor throat for having betrayed the cause of monogamy. These progressives don't seem to understand that a cause is a cause and private life is private life, and the twain need not necessarily go hand in hand.

Cooperatives have now come to the rescue by cooperating in publicising the brighter side of the picture. Their advent in the field of social ethos is a welcome sign. Industries with cultural pretensions are the 'in' thing today. They may liberally finance artistic establishments or promote culture through strategically placed ads. All in the cause of the nation. In fact another leading light is the chairman of the Mahila Arthik Vikas Mandal, whose heart has gone out to the bigamous man in question. What better way to go about economic development of women than to get them disillusioned and deserted by men and then get them jobs to do?

Ours is a secular state. What is wholesome for Akbar must be nutritious for Amar. That is just scientific temper, which we are developing, and developing fast. So have Hindus earned the right to get into the nuptial knot a second time, with the blessings of law-abiding *pujaris*. If you can pray to 33 crore gods surely you can have as many women to keep you company. Lord Krishna had them. Swetaketu's golden words apply to all mortals.

The nasty press, always ready to have a dig at everybody who is anybody, wastes precious newsprint in publicising private affairs of this sort. A whimper was heard in Parliament the other day when a Hindu *nakshatra* married a dream girl for the second time. On second thoughts our elders gave clandestine blessings to the clandestine wedding dug out by the press. After all if the former wife is prepared to take it with the salt of her tears, and the second spouse wouldn't care less, why raise hell? Everybody seems so perfectly happy. Second wives have become beaming mothers, husbands are gloated over more and more, a sure sign of the Indian brand of good health. In the villages, where India lives, it must be having a field day. You need not bring in those suicides by spoilsport actresses who couldn't bear being the second woman.

First wives are being deluged with unsought advice by well-meaning friends to hurt their wrong-doing husbands by marrying again and making a hell of their lives in another man's house, for the sake of sweet revenge. The only snag, is they have to get a chit from the court marked 'divorcee'. That isn't very secular, is it? □

Defence in the Eighties (*from p. 6*)

with its neighbours. Moreover, in the South-South context, now that India is emerging as a major actor, 'militarism' would make this country suspect in the eyes of the rest of the Southern fraternity. It is further argued that the resources now being spent on defence could profitably be used elsewhere, in other vital developmental sectors of the country's economy.

There are indeed no conceivable incentives for either Pakistan or China to engage India in a military confrontation. There are severe constraints on their part. It is also a fact that the political dialogues with our adversaries are continuing. Yet, all these do not mean that the basic causes of conflicts between India and China, on the one hand, and India and Pakistan, on the other, are in the process of being removed totally. As everyone knows, these conflicts are deep-rooted; it may take several decades and several generations before a permanent state of amity is achieved, if that is at all possible. In the intervening period, however, there are always chances of mistaken perceptions and misread signals leading to conflicts and wars. Since one way of avoiding actual hostilities is to influence the adversaries' perceptions in regard to this country's strength and determination, defence preparedness must continue to be uninfluenced by ups and downs in political relations.

Therefore, it is not correct for us to follow the examples of Nepal or Sri Lanka or any other country because they are spending much less than India on their defence. If statistics are followed to the logical end, we find that this is because of the simple reason that India is fifty times or more bigger in size than these, as much larger in population, and probably many times bigger in terms of the country's security requirements and also its resources.

As for the Southern fraternity, its share in the global defence spending is 16 per cent (excluding China). This works out to 80 billion dollars, while that of the Northern countries is 375 billion dollars. India, which constitutes one-seventh of humanity, shares a burden of less than one per cent of the total world spending. In other words, India which represents 30 per cent of the Southern population expends 5 billion dollars on defence, which constitutes 6 per cent of the Third World total. The remaining 94 per cent of the Third World defence spending, or over 75 billion dollars, are spent by the rest of the 70 per cent of the Southern world. Therefore, there is no reason why India should feel apologetic about its modest defence outlay.

As for the money spent on defence, one has to take an overall view to know the real nature of defence burden. True, in terms of absolute figures the defence outlay may look awesome. In fact, as the table below shows, the increase in India's defence expenditure represents largely the growth of the Indian state and its economy. In the past decade India's national income increased by 304 per cent and per capita income by 242 per cent. Corresponding increases in defence expenditure was 263 per cent and per capita burden 111 per cent. The table indicates three-fold growth in all major sectors of the economy. Even after providing for inflation, growth in all the sectors remains substantial.

India: Defence Expenditure in Perspective

Item	*1970*	*1980*	*Percentage Increase*
Population (in crores)	54	67	—
National Income (in Rs. crores)*	34,235	104,201	304
Per Capita Income (in Rs.)*	633	1,537	242
Agriculture and Allied (in Rs. crores)*	17,307	41,479	239
Industry, etc, (in Rs. crores)*	6,790	24,421	359

Financial and Real Estate (in Rs. crores)*	1,683	5,618	333
Community and Personal Services (in Rs. crores)*	3,285	11,034	338
Central Expenditure on Social and Development Services (Rs. crores)	320	891	278
Central Expenditure on Education (Rs. crores)	87	267	307
Central Expenditure on Medical (Rs. crores)	18	68	382
Central Expenditure on Public Health (Rs. crores)	12	31	254
Defence Expenditure (in Rs. crores)*	1,443	3,800	263
Defence Expenditure as Percentage of GNP	3.4	3.8	—
Per Capita Defence Expenditure (in Rs.)*	27	57	111

*Current prices

Defence spending as percentage of the country's GNP varied from 3.2 to 3.8 during the last decade. Except for 1963-64, when the military expenditure reached a peak, the Indian defence budget had remained below 4 per cent of the GNP. The budgeted expenditure for the current year is Rs 5,100 crores as against the revised estimates of Rs 4,600 crores for 1981-82. The present and future level of defence spending may thus represent a new magnitude of defence spending, which may be in the region of 4 per cent of the GNP. Probably this may remain the trend for the 1980s in view of the rising international tension and the country's need for modernisation and equipment programmes for the forces.

There are 34 countries, as listed by the Stockholm International Peace Research Institute (SIPRI), which spend 4 per cent or more of their GNP on defence. Twenty-seven of them belong to the developing world.

Another indicator of the defence burden is the per capita expenditure on defence. Out of the 65 countries studied by the International Institute for Strategic Studies (IISS) in 1981, India ranks the lowest (next only to Indonesia) in terms of per capita defence burden. It is 7 dollars as compared to 98 dollars of Japan, 154 dollars of Switzerland, 455 dollars of Sweden, and 759 dollars of the USA. For Pakistan it is 17 dollars and for China 56 dollars (1980). Even in terms of defence expenditure as percentage of Central Government spending, India at 16.9 per cent in 1981 ranks lowest (next only to North Korea — 14.7 per cent) among the developing countries.

It is not the purpose here to suggest that defence spending is the ideal form of productive use of scarce resources. Nor is it implied that there is no scope for adopting efficient managerial and economy measures. But that is a different story. To argue, as one eminent journalist has done, that though we are spending more than Rs 70 per head on defence, we do not find enough money to nourish malnutritioned children, is to lose perspectives of both defence and development. Maybe more resources could be devoted to population control and care of pregnant women and thus reduce births of congenitally malnutritioned babies. Or maybe some of the hundreds of crores spent in this country on tobacco and alcohol could be diverted to this noble cause.

What is needed therefore is a concept of total planning for defence and development to optimise both. A high-level coordinating council could probably identify the priorities jointly in both defence planning and development planning, which exercises are presently being done independently of each other. (*April 20*)

Offshore Exploration *(Contd. from page 5)*

fleet, surface or sub-surface, which happens to pass by. These recordings of the noise characteristics of each can easily be passed on by an exploration company to an interested power. These will be of immense help to the passive detection systems of an adversary's submarines against our own vessels.

Even if the ONGC be entrusted with the technical monitoring, as distinct from mere management monitoring, many subterfuges are available to an operating company to mix its legitimate seismic information recording function with the covert function of collecting strategic information. Micro-instruments of like appearance and the tenuous difference, superficially, between operations for legitimate data collection and those for finding our vulnerabilities will always help an operator to put a gloss.

Even at this stage the Government should cancel the prospecting right given to Chevron. It would not mean any invidious distinction against this particular company, nor would it be an aspersion on it, if a principled decision is taken that no offshore area would be leased out to any foreign company.

Our security interest demands that we do this, immediately.☐

Ershad's Problems *(Contd. from page 10)*

the present regime. These are small matters and often the result of over-enthusiasm of those who are more loyal than the king. The officer in charge of the police station where the Indian journalists were detained was himself reported to have expressed surprise at the incident when he came to know about it the following day.

India's and Bangladesh have had official-level negotiations in Dacca regarding inland water transit and trade. The Standing Committee of the Bangladesh-India Joint Rivers Commission has met to fix priorities and assign specific issues to five local-level joint committees pertaining to the five border rivers, namely Gumti, Monu, Khowai, Dharia and Dudhkumar. The Committee has also discussed implementation of the Ganga Water Sharing Agreement. There are indications that Bangladesh is giving serious thought to a long-term solutions of these problems. It is significant that Ershad himself holds the portfolios of Foreign Affairs and Water Resources.

India's External Affairs Minister P.V. Narasimha Rao, who was scheduled to visit Dacca on April 30 and who was reported to have been reconsidering his plan following the coup, has now been personally invited by Ershad to pay the visit by the end of this month and prepare the ground for a review of the Farakka agreement scheduled for May. The General has announced that he would be Rao's host and would personally lead the Bangladesh delegation at the talks. The outcome of these negotiations would indicate which way the wind will blow. Till then let us keep our fingers crossed.☐ *(April 19)*

Land Reforms *(Contd. from page 18)*

joint farms with landless labourers; Ramaswamy Reddiar and M.G. Ranga, in their minute of dissent, objected to "making the actual cultivation of land a cooperative process through compulsion" and also to "narrowing down the maximum extent of land" in the case of "really brilliant, capable and experienced agriculturists". These champions of "brilliant farmers" did not fail to organise a campaign against the recommendations of the Congress Agrarian Reforms Committee. In the 1960s the ruling class chose to beat a retreat. In fact, it became wedded to the modernisation of agriculture via technology, which led to the ruin of the small peasants throughout the country.

The question is whether an alternative strategy corresponding to the long-term interests of the small peasants and agricultural labourers can be formulated. As the policy statements of the Kisan Sabha show, the emphasis is on land reform, occupation of land, rural credit and remunerative prices for crops. Curiously, cooperative agriculture seems to be a remote ideal. In the memorandum submitted to the Land Revenue Commission in 1939, the Bengal Kisan Sabha, while advocating "the transfer of full rights of property to the individual cultivators", noted that "it is no solution of his poverty. The average cultivator has not the money to buy seed ...Reclaimed land should be state-owned and worked by agricultural labourers". Apparently the need to develop the large unit of cultivation in the form of cooperative farm was not even the long-term goal of the Kisan Sabha. In 1970 the All-India Kisan Sabha envisaged the formation of voluntary cooperatives as part of the struggle for land reforms: "In a vast country like India, modernisation of agriculture can effectively be undertaken through voluntary cooperatives, which would increasingly play a dominant role in our agrarian economy". But this formulation went imperceptibly into the background, as the Kisan Sabha carried on agitation for radical land reform, which was nowhere undertaken except in Kerala and West Bengal.

There is a new-found sense about the importance of cooperative farms in West Bengal today. As the report of the CADC which grew out of the giant CADP launched in 1974 shows, cooperative farms have been formed in a few districts. Such experiments, if multiplied, can lay the basis of large-scale cooperative farms which will exist alongside small farms. Only dogmatists would argue that cooperative farms can be viable when state power is in the hands of the working class. In Italy, a capitalist state, there are more than 30,000 cooperative farms, of which three-fifths are communist-led; the cooperatives farm is an integral part of the agrarian programme of the Communist Party for accelerating agricultural growth. (C. Marzani, *The Promise of Eurocommunism*, 1980). What needs to be emphasised is that the allottees of surplus land will feel helpless in the face of the increasing strength of free market forces, while the jotedars and rich peasants will add field to field by leasing in the land of small peasants. The danger is indeed grave.☐

PLAN YOUR CAREER

Booklets on various careers and fields of employment are available with Controller of Publications, Old Secretariate, Civil Lines, Delhi-110054 **authorised agents** and various Employment Exchanges. A list of publications is given below :

Sl. No.	Name of the Publication	Price (Rupees) English	Price (Rupees) Hindi
1.	Careers for High/Higher Secondary School Leavers	1.40	2.50
2.	Careers for Arts and Commerce Graduates	2.90	7.25
3.	Career for Agricultural Graduates & Allied Scientists	0.60	2.25

Rs. 888/- nett for two.
Rs. 666/- nett for one.

Free stay for two accompanying children (below 12 years of age). Meals extra.

Choose from:

Mandu: 7days & 6 nights at the City of Joy. Reminiscent of a royal era, famous for its pleasure palaces and pavilions. Stay at the Ashok Travellers Lodge.

Tariff includes: Full board, lodging for 6 days.

Kulu & Manali: 6 days & 5 nights at India's best-loved hill resorts. Kulu, the Valley of Gods, or Manali, the pine-scented idyll. At both places, Ashok Travellers Lodges welcome you.

Tariff includes: Room, breakfast, lunch or dinner for 5 days.

4 days and 3 nights at any one of:

Kovalam: Palm-fringed beaches and miles of unspoilt sand that make Kovalam one of the world's finest beach resorts. Stay at the Kovalam Ashok Beach Resort.

Mahabalipuram: Where history meets the sea, and the 7th century rock-cut temple still stands on the shore. Stay at the Temple Bay Ashok Beach Resort.

Mysore: The city of palaces and boulevards. Ashok Group welcomes you at the Lalitha Mahal Palace Hotel—where lifestyle spells splendour.

Udaipur: In the City of Lakes, stands the Laxmi Vilas Palace Hotel. A Rajput palace, overlooking the Fateh Sagar Lake.

Khajuraho: Famous for its unique sculptures. The Khajuraho Ashok stands in the shadow of history.

Bhubaneshwar: Explore ancient Buddhist shrines or the sandy beaches of the east coast. From the comforts of the Kalinga Ashok.

Agra: The city of the Taj—and so much more. Your base—the Mumtaz Ashok.

Aurangabad: The gateway to the cave sculptures of Ajanta and Ellora. And you stay at Hotel Aurangabad Ashok.

Shillong: Explore the "Scotland of the East" from the Hotel Pinewood Ashok.

For the above destinations, tariff includes room, breakfast, lunch or dinner for 3 days.

39 other attractive packages to choose from:

- * 5 nights at 5 destinations. Tariff includes room only.
- * 4 nights at 4 destinations. Tariff includes room and breakfast.
- * 3 nights at 3 destinations. Tariff includes room, breakfast, lunch or dinner.

Offer open from 1st April to 31st October, 1982.

VOL XX NO 35 SATURDAY MAY 1, 1982 Re 1

EDITOR'S NOTEBOOK

Eyeless in Punjab

WITH the latest round of communal violence in Punjab, a new dimension is added to the danger of national disintegration that has been slowly creeping into our body politic.

The provocation this time has been provided by Dal Khalsa miscreants planting the severed heads of two cows in front of two Hindu temples at Amritsar on April 26. If the misdeeds of the Sikh extremists were so long confined to such antics as the hijacking of an Indian Airlines aircraft to Pakistan and the blatant secessionist demand for an independent Khalistan, this time they have invaded the precincts of Hindu-Sikh communal relations, vitiating it by a calculated move to hurt the religious susceptibilities of the Hindus in a State in which Hindu orthodoxy is firmly entrenched in the form of RSS. The Dal Khalsa's open acknowledgement of this piece of misdemeanour as a means to hasten the ban on smoking and sale of tobacco in the immediate neighbourhood of the Sikh community's holiest of the holy, the Golden Temple at Amritsar, brings out the direct threat it poses to the fabric of Indian nationhood, negating its secularist commitments.

It is by no means a comforting thought that such a direct act of provocation aimed at destroying Hindu-Sikh amity should be enacted in a strategically-situated frontier State, where a section of Sikh extremists have already been engaged in working for secession with help and encouragement, overt and covert, received from abroad.

THE conventional view so far held has been that communal tension in this country is by and large confined to Hindu-Muslim relationship, and any attack or disadvantage suffered by the Muslims in India has so long been delectable meat for Pakistani propaganda. In recent times the Hindu communalist outcry against some cases of Harijans embracing Islam has been coupled with a mendacious campaign of Saudi gold propping up Muslim communalism in this country.

The position on this score has been decisively changed with the success of Indira Gandhi's recent visit to Saudi Arabia while her warm reception at the

hands of the ruling establishment and at the popular level has been greeted by a chorus of slander in the Government-controlled press in Pakistan: in contrast, the impact of the Prime Minister's Saudi visit has been positively wholesome on the psyche of the Indian Muslim. In this respect, Indira Gandhi can very well claim to have undertaken a successful political Haj earning the accolade of India's largest minority community.

RECENT developments have however demonstrated that the mischief of fissiparous forces is not confined to the arena of Hindu-Muslim relations. The riots at Kanyakumari some time ago brought out how these elements sought to vitiate long-standing communal amity between Hindus and Christians. Now at Amritsar, vicious communalism is being deliberately spread to poison the relationship between Hindus and Sikhs, who with all their differences, have long lived in mutual amity.

It would however be a mistake to blame the external forces for engineering such new dimensions of communal tension in the growingly uncertain political climate in India today. Our own record at home needs to be scrutinised with stern objectivity. Sikh communalism has not mushroomed overnight. Its roots have a long history, but there have been periods in our contemporary times when this was curbed, if not brought to the point of virtual extinction, as in the days of Pratap Singh Kairon's Chief Ministership.

But the secular crusade against Akali communalism could not be sustained because of the exigencies of parliamentary politics. Both the Congress and the Opposition have been guilty on this score: neither can claim to have denied any quarter to Akali communalism. The factional in-fighting within the Congress in Punjab has often been reflected in one group ganging up with the Akali bosses to outwit the rival group.

For the last two years and more, Union Home Minister Giani Zail Singh has been known to have been moving heaven and earth to oust Punjab Chief Minister Darbara Singh. Apart from intrigues within the Congress and manipulating the media for this purpose, the Giani has indulged in rather shameless hobnobbing with the Akalis — and this includes his touching the feet of the leader with acknowledgedly extremist leanings, Sant Jarnail Singh Bhindranwale, whose sympathies for the Khalistanis are not unknown. Such dangerous extension of Congress-I faction-fighting to the point of abetting Akali extremism for the purpose of discrediting the Punjab Chief Minister, has so far invited no reprimand for Giani Zail Singh. That the Giani is not overburdened with political wisdom is no news in New Delhi, and those who are familiar with his cerebral attainments were not surprised by his gratuitous tribute to Hitler's genius in a typical outburst in Parliament, which earned for him the unique distinction of being the only Home Minister whose observations on a political issue had to be expunged from parliamentary proceedings. For such a politician to be involved in playing soft to Akali intransigence — to say the least — to fight the Chief Minister belonging to his own party, is not in the least unusual. What is extraordinary is that such a character should continue to be retained as the Home Minister of India.

If indulgence towards Akalis on the part of Giani Zail Singh weakens the Congress-I stand against communalism in Punjab, the record of a notable section of the Left is no less unworthy. The CPI-M in Punjab has long been known to have kept up entente with a section of the Akali leadership for the purpose of sharing the loaves and fishes of parliamentary electioneering: in the latest round, the CPI-M has unembarrassedly come into the arena of mass political action in the company of the Akalis to block the construction of the Sutlej-Yamuna link canal, necessary for the equitable sharing of the Ravi-Beas waters arranged by mutual agreement between the three State Governments of Punjab, Haryana and Rajasthan. By all objective assessment, this has no doubt been a fair deal, but the Akali leadership has been trying to whip up Sikh jingoism for short-term political gains. What is amazing is that the CPI-M with its pretensions of being a national party, has not hesitated in joining this agitation which is meant to generate inter-State acrimony. The CPI-M's growing political links with Akali politics disables it to a considerable measure, in the crusade against communalism in Punjab.

WHILE there will now be a chorus of pious platitudes exhorting the people in Punjab to maintain communal harmony, the record of most of the political parties on this score is far from clean. Perceptibly the political leadership in Punjab has shown up its bankruptcy in combating communalism—Hindu or Sikh. The punitive measures that Darbara Singh's Ministry may have to resort to will be nullified so long as on the political plane, different parties are unprepared to excommunicate Akali communalism and its Hindu counterpart. The expectations of narrow political gains have made them myopic, if not totally blind, to the grim threats to the nation's integrity.

Punjab today thus poses the greatest challenge as well as gravest danger to Indian secularism.

COMMENTARY

Why Licensing Policy Changes?

THE recent revision of the list of core sector industries under Appendix I of the Industrial Licensing Policy in order to facilitate the entry into this sector of big business houses and foreign companies has not come as a surprise. Talk of such a change had been going on for quite some time, and the Minister himself had hinted at this a few months ago at a seminar abroad. Almost a month back, an economic daily had come out with a lead item captioned "MRTP Act changes under way: Big houses' entry into 90 'zero industry' areas to be allowed". It was revealed that the Government was going to allow them to undertake the manufacture of commercial vehicles without any restriction. It was added: "The argument in favour of permitting large houses is that the type of investment required for such a gigantic task could be found only with the large houses."

It is needless to add that this argument is not very incorrect if one assumes that public sector enterprises are not to be made so profitable as to generate investible resources, the rural rich are not to be directly taxed, and the private corporate sector is to be given fiscal concessions and incentives to increase investment and production. These assumptions or constraints have been implicit in almost all decisions and policy-pronouncements concerning the industrial sector since the 1970s.

Though lip-service is still being paid to the importance of the public sector and to the basic framework provided by Jawaharlal Nehru's Industrial Policy Resolution of 1956 which was to keep the commanding heights of the economy in the hands of the public sector, in fact the balance has tilted in favour of the private sector. This was apparent when Charanjit Chanana told the Lok Sabha on July 23, 1980, while presenting the new Industrial Policy Statement: "Now that the Congress Party has been entrusted with the responsibility of the Government, what is needed above all is a set of *pragmatic policies* which will remove the lingering constraints to industrial production and, at the same time, act as catalysts for faster growth in the coming decades." The main emphasis was on raising the growth rate.

Soon afterwards 'the provision for automatic growth' was extended to more industries. Production for export came handy to circumvent the provisions of licensing policy and the MRTP Act. It was stated that exports would not count against licensed capacity, and diversification was freely allowed in respect of a number of industries.

During the last financial year, even more concessions and relaxations were announced. To quote a Government report: "Investment limits...were raised. Installed capacities in excess of licensed/registered (limits) in thirtyfour selected industries have been regularised. These include basic industries and those producing mass consumption goods ... Automatic growth has been allowed to the extent of 5 per cent per annum or 25 per cent in a five-year period in the registered or licensed capacity of nineteen additional industries, bringing the total of such industries to thirtyfour. There has also been some relaxation in industrial location policy with a view to providing for natural growth for export production ... Production for exports will not be counted in the licensed capacity of an undertaking and it will also not be taken into account for the purpose of determining 'dominance' under the MRTP Act."

In February this year the Government categorically stated that it was going to carry liberalisation still further: "As 1982 is the 'Productivity Year', further measures to enable industrial undertakings to optimise production out of existing capacity need to be taken as a matter of urgency. The new 20-point Programme reiterates the need to maximise power generation and improve the functioning of electricity authorities. It seeks to further liberalise investment procedures and streamline industrial policies."

Close on the heels of this announcement came partial decontrol of cement and the new integrated export-import policy. In a major policy decision which might prove detrimental to the country's security, the Government allowed the involvement of private sector firms in the field of defence electronics. Thus, monopoly houses were allowed to reap increasing profits from involvement in defence production for which the budget allocation has been going up every year.

What we have till now tried to show is that the latest declaration is neither an isolated event nor a bolt from the blue. The surprising thing is that all these months there has been no mobilisation against this trend in the Government's industrial policy. On all sorts of issues and questions, national and international, conferences and seminars, rallies and demonstrations have been organised, but the economic policies and the state of the Indian economy have not merited more than brief mentions in resolutions of Left parties and editorials of their official organs. Are these Left parties not guilty of being passive spectators? Why can they not visualise the shape of things to come and prepare to resist changes detrimental to national interest? This may be because they are unable to foresee developments or they are just not interested.

Now it is an open secret that the MRTP Act is to be overhauled in such a way that whatever teeth it has are made completely useless. The Ministry concerned seems to have thrown the report of the Sachar Committee into the dustbin. Is this not a subject deserving more attention than one or two lines in obscure places in the journals of Left parties? Why can't economists be mobilised along with trade unionists to hold debates and discussions all over the country and organise rallies and demonstrations, submit memoranda and run a campaign through democratic papers?

The five new areas opened to large houses and FERA companies include (1) high technology reproduction and multiplication equipment, (2) carbon and carbon products, (3) pretensioned high pressure RCC pipes, (4) rubber machinery, and (5) printing machinery.

Big business houses and MNCs will be permitted to set up units even in industries not included in Appendix 1 provided the units are predominantly export-oriented, and this export-orientation has been defined as the capacity to export 60 per cent to 75 per cent of the production. Only last year the Government had allowed 25 per cent expansion of the production capacity of certain industrial units over the 1980-1985 period. Now the Government has decided to allow industry 33.3 per cent capacity over the best production during the last five years over and above the 25 per cent excess production already permitted. This will apply also to the drug industry which is dominated by MNCs and their subsidiaries.

All these changes have been brought about in the name of "the present need for increased production, higher export generation, adoption of modern technology" etc. Revision of the list had become necessary because "several developments have taken place (since 1973 when it was prepared) in terms of technological advancement, changing potentiality for export, development of middle level entrepreneurship... need for establishment of adequate capacities in certain industries consistent with the level of technology and quality standards, etc."

One is at a loss to understand the silence on the need to curb the growth of monopolies and MNCs and make the public sector expand continuously. Even the technical considerations stated above are not convincing enough. The question is: Why cannot the public sector be relied upon to do the job? If it is inefficient or not equal to the task, why cannot this deficiency be removed?

It is not without reason that the FICCI has hailed this change. Its president has said that it will create conditions for augmenting production and raising productivity. One industrialist has said: "The Government's decision to allow the industry 33.3 per cent capacity over the best production during the last five years is an excellent step to remove production constraints"

Economist,

April 25

Order, Order!

President Sanjiva Reddy's concern over deteriorating standards of conduct in the legislatures and the tendency of elected representatives to contribute with all their might to disorderly scenes, paying proportionately less and less attention to the responsibility entrusted to them, will be widely shared by enlightened public opinion all over the country. The President, speaking at a Bangalore function on April 24 to commemorate the centenary of the Mysore Representative Assembly, referred with regret to the fact that even during debates on important issues concerning public welfare, attendance in legislatures was poor. He made a pointed reference to the quality of debates also.

But frankly, poor attendance during important debates, whether in Parliament or in State legislatures, is perhaps the least disturbing aspect of the situation. If one recalls newspaper headlines and reports of recent months and years, perhaps even the current quality of debates on matters of vital public importance and interest, most decidedly in a tattered state, will not depress one unduly. Consider the facts. For the present, only very recent facts.

During the month or so that preceded Sanjiva Reddy's pained observations, there were several ugly scenes in legislatures. There was "pandemonium" — to use a handy word popular with the media — in both houses of Parliament over the imposition of President's rule in Kerala; perhaps not surprisingly, those who had been demanding dismissal of the Ministry and holding of elections were the noisiest contributors to the pandemonium. Even the "elders" in the Rajya Sabha, intended to make up, in true Westminster style, any deficiency in wisdom or sobriety of the Lower House, got into the spirit of the times. Walkouts and full employment of lung power are only part of the scenario.

But then the houses of Parliament, despite occasional din and much inane speech-making from both sides, and the poor quality of even the Budget debate, are a haven of peace and tranquillity compared to some of our State legislatures. Not even that odd member's recent effort to burst into song really made much difference in this regard.

Towards the end of March, in the Rajasthan Assembly, to quote a newspaper report, "members from both the Treasury benches and the Opposition ... exchanged blows, kicks, and jostled one another when their lung power had been practically exhausted," and on top of all this, "chappals were used in the clash. Not only members were dragged out and beaten up but the watch and ward staff was also prevented from entering the house." Much more than this happened, and no wonder the house was adjourned sine die ten days in advance of the scheduled date.

The Budget session of the Bihar legislature "had a stormy start ... with the entire Opposition raising slogans denouncing the Government" (no doubt well merited), and several members "tore up the order papers and flung them towards the podium" as the Governor rose to address the joint session.

The Haryana Assembly, now dissolved, was no less grotesque in terms of its proceedings. Nor even the Jammu and Kashmir Assembly. Indeed, hardly any State legislature has been free from scenes that would make boisterous college and school boys envious.

Here is one area of public life where North and South seem to be equally at ease and even quite competitive. There were, for example, unruly scenes (or exciting scenes, depending on your taste) in the Tamilnadu Assembly late last month (March) and early this month (April). On one occasion, says a report, noisy scenes culminated "in the Deputy Speaker running out of the house to fight it out with a defiant DMK member." A few days later, "paper-weights flew and AIADMK and DMK members came close to blows"; "a near-riotous situation prevailed in the house for nearly fifteen minutes" with members from both sides "throwing paper-weights at one another and exchanging invectives". The two gentlemen who we are told started it all were no less than the Law Minister on the one side and the Leader of the Opposition on the other. The noise over the cement deal in the Karnataka Assembly was in comparison perhaps quite mild, though, one does remember equally exciting scenes in that august house too in the past, as in Maharashtra and elsewhere.

These are mere samples which provide no more than a vague idea of what is going on in our legislatures constituted at great cost and maintained at rather heavy expense. And this is the situation which Sanjiva Reddy wants to be changed, restoring a measure of dignity to proceedings and standard of debate. Considering that the deterioration that he deplores has not taken place overnight but has taken place steadily over some years, one does not know how far his advice will be heeded, even if the public are undoubtedly behind him in this highly valid enterprise.

The President, whose experience as legislator and Minister has been substantial, wants a procedure to be devised under which as many members as possible are encouraged to make their contribution in the shaping of Government policies, in the appraisal of Government performance, and in the whole legislative process. That is a proposition with which no one can quarrel. And Sanjiva Reddy notes that the best speakers are those who are not only the best informed but the most courteous members who never fail to observe parliamentary decorum. Again, an unexceptionable statement.

The question is, how do we go about restoring dignity to these many houses at the Centre and in the States? How do we ensure that members are well informed on the subjects they are taking about? How do we prevent the proliferation of the strong, silent members who are seen and heard only when there is a crucial vote to be taken or a bizarre scene created or furthered? Who, in short, will undertake the education of our parliamentarians and legislators (all honour to the honourable exceptions)? The political parties? Full fledged institutions filled with experts of all sorts? The task does seem forbidding, but at least our political parties and their leaders must give serious thought to what the President has said, in the interest of safeguarding and strengthening our parliamentary democratic system and thereby the Republic itself. Parliamentarians and legislators must keep themselves informed and contribute to debates in the houses of which they are members if democracy is to serve any purpose. The public will certainly endorse Sanjiva Reddy's call to legislators to present their points of view cogently and persuasively, keeping the public interest in view. Yes, even if that means depriving some of our hot-sales newspapers of their daily grist.

We may draw up a code or prepare a framework. That is easy. The hard part is to implement it, what with so many houses and so many members, so many parties and so many factions, so many interests and pressures. An American story goes that when Woodrow Wilson accosted Moses in heaven, the latter commiserated with him about the fate of his Fourteen Points for world peace. Wilson advised Moses to go down to the earth and see what they had done to his Ten Commandments.

One would not like such a fate to overtake Sanjiva Reddy's advice on legislatures and their members.

April 27 *C.N. Chitta Ranjan*

Arms Race and Human Rights

D.A. DESAI

THE Second World War inserted the last nail in the coffin of the League of Nations. The devastation and the destruction caused by the Second World War compelled the leaders of the world to devise an effective machinery for securing international peace and harmony. The holocaust of war heaped immeasurable loss of men and materials on the countries which were the battlefields of war. The USSR, France, England, Germany principally in Europe and Japan in Asia suffered such terrible destruction that it became a compelling necessity to reorient and readjust international relations based on lasting peace. The Atlantic Charter and the subsequent setting up of the United Nations promised an era of peace and prosperity. High idealism informed the drawing up of the UN Charter. A reference to the promise of plenty made in Article 55 of the Charter may be advantageous.

> With a view to the creation of conditions of stability and well-being which are necessary for peaceful and friendly relations among nations based on respect for the principle of equal rights and self-determination of peoples, the United Nations shall promote: (a) higher standards of living, full employment and conditions of economic and social progress and development; (b) solutions of international economic, social, health and related problems and international culture and educational cooperation; and (c) universal respect for and observance of human rights and fundamental freedoms for all without discrimination as to race, sex, language or religion.

Victory in Europe Day was celebrated in 1945. A stock-taking of the last four decades is disturbing and agonising. The wholesale genocide taught one lesson, that if mankind is not to repeat the fatal error in the foreseeable future with thermo-nuclear weapons, it is but meet that the natural resources of the globe must be so equitably distributed and the international economic order must be so devised that the ugly, distressing picture of unpardonable waste in one hemisphere and starvation and destitution in another is avoided.

Respect for boundaries of the nation-states, right of self-determination, equitable distribution of the world's resources, would pave the way for lasting peace. In this scheme of things there is no place for merchants of death. Employment by large-scale manufacturers of lethal weapons is a mirage. Manufacture of weapons can only be avoided if the international order is based on mutual understanding, co-existence, respect for national boundaries and right of self-determination. The old outmoded and expended theories of spheres of influence and balance of power should have no place in the scheme of things envisaged by the Charter.

Human nature has never been ideal. Every society nurtures a belief that it is the only ideal society and any other form of society is anathema. Since the revolution in the USSR an entirely different kind of society with different values emerged. Its economic doctrine, social integration and anti-capitalist stance shook the world capitalist order. Instead of appreciating the emergence of a new society ushering in socio-economic justice, equality and non exploitation, the capitalist society felt threatened, and the fear psychosis provided a facade for multiplication of arms. The world again started getting divided into capitalist versus communist societies in place of empire holders and colonies. Once a feeling of insecurity is generated, security by arms is accorded high priority. The vicious circle starts.

Manufacture of arms raises two problems. With the vast advancing nuclear technology and space research, arms of today become obsolete in a short while. Research proceeds at break-neck speed, the target being maximum destruction of mankind, not of property, because in a capitalist society property is placed on a higher pedestal than the human being who is supposed to enjoy it. The latest research in this behalf establishes the truth of the statement. The manufacturer of arms must find a market for the obsolete arms. They have to be dumped somewhere. There are countries in which military regimes have perpetuated their hold and they are ready to buy arms. The greater the proliferation of arms, the larger the threat to international peace. To the extent industry is diverted to the manufacture of arms, its capacity to produce consumer goods is proportionately decreased. To that extent humanity suffers.

Having generalised the propositions let me turn to some stark facts. One UN survey shows that since the Second World War the world has spent more than six thousand billion dollars on research, manufacture and proliferation of arms. The developed countries in their search for full employment keep their arsenals of arms full. If these developed countries had stockpiled arms within the country, the developing countries would not have suffered much. But the export of arms to sensitive areas creates problem for countries which are wedded to international peace and which want to concentrate their energies on the development of society. Nearer home, arming of Pakistan by the USA and introducing most sophisticated F-16 war planes, has pushed up much to our dislike our military budget.

How much this mad exercise costs may be illustrated by our own experience. Till 1960 India had a comparatively low military budget. Then came the unprovoked Chinese aggression (1962) and the whole approach had to undergo a change. Since then the military budget started shooting up starving our welfare services. 1965, the Rann of Kutch

DISCUSSION

Indian Development: Options and Choices

The perspective of Indian development is fast becoming a matter of crucial concern for the polity of the nation. Taking into account the need for serious discussion of the state of our political economy and the options before the country, *Mainstream* (March 20, 1982) published a contribution from a distinguished observer of the economic scene. This was followed by contributions from Dr C.H. Hanumantha Rao (*Mainstream*, April 10) and Mohit Sen (*Mainstream*, April 24). Here we publish an article written by an authority who, being a senior functionary in an international agency, prefers to withhold his name. — *Editor*

AN ECONOMIC OBSERVER

A Student of Political Economy, in his discussion note in *Mainstream* (March 20, 1982) has focussed attention on an issue which is acquiring a growing relevance for India's political evolution in the immediate years to come. This issue has been at the centre of debate in the Left movement over several decades now and continues to occupy attention to this day. Positions on this issue have governed, among other factors, the relationship of the two Communist Parties for a long time now, including their relationships with the international Communist movement. The issue provided a backdrop to the recent discussions on the CPI-CPM unity at their two congresses at Varanasi and Vijaywada, earlier this year.

As the programme for action of the Left is to a large extent affected by ideological positions on this basic issue, it is only natural that the working people of India should be able to consider the question in all its apects and ramifications and be able to take appropriate action according to their lights in their respective spheres of action. It is, therefore, necessary to examine the note carefully and analyse its contents critically and constructively.

The basic propositions advanced in this note are as follows:

(1) *A la* Gramsci, at a particular point of history, a ruling group need not invariably and consistently represent a specific class, or a permanent interest alliance, but only a coalition of pressure groups which can give it the necessary support to capture and wield state power in an institutional framework of elections and democratic government.

(2) Indira Gandhi today is a leader of a coalition of pressure groups which could be identified with the pressure groups constituting the Left; and her policy positions, with the ingredients of a policy framework which could be associated only with the alliance of the Left forces.

(3) Indira Gandhi is the leader of this coalition today because she had come to symbolise the 'spirit' of the Congress Party — in other words, the traditions of the national freedom movement under the erstwhile Congress Party — and it is that which has given her the 'charisma' of appeal to the Indian masses. For this reason, she has become a 'historical' force.

(4) Indira Gandhi, as a political being, is legitimately interested in retaining power. She, therefore, cannot afford to sacrifice the basis of her charisma or compromise the interests of India in any manner whatsoever.

(5) For these reasons, the political interests of Indira Gandhi and those of the Left have largely converged in the context of the Indian economy today, and the Left should strengthen the coalition pressure groups around her.

(6) If the Left could strengthen that coalition of pressure groups, it would strengthen its own cause.

(7) The fear of the Left that Indira Gandhi would promote a monopoly-capitalist pattern of development in alliance with foreign multinationals is without any basis because such a pattern of development, with Indira Gandhi at the helm of affairs, will come into conflict with the need of accommodation of Western capitalists in the Indian economy. Since such accommodation will tend to erode her political base and contradict her policy positions, it is unlikely that Indira Gandhi will opt for such a pattern of development, for her, the only way to prevent the growth of monopolist-capitalist elements (presumably including Western multinationals) is to develop countervailing power mainly in the form of public sector enterprises supported by the growth of medium and small enterprises. The development of such countervailing power will depend upon the strength of the pressure groups that the Left forces will represent and how that strength grows over time and space.

It will be noted that these propositions are only the offshoots or second-degree derivatives of some well-known premises of Marxist economic and political theory, and pragmatic generalisations about the Indian political economy since Independence. The scientific validity of these propositions would ultimately rest on the accurate understanding of these theoretical premises and their correct application to the political realities of Indira

Gandhi's positions and her policies. It is, therefore, necessary to look into the theoretical premises more deeply and examine their scientific validity and applicability to the conclusions of the author.

The idea that a ruling group invariably represents a class or permanent interest alliance derives from the Marxian theory of state which states that, in a society divided into classes, "the executive of the modern state is but a committee for managing the affairs of the whole bourgeoisie",[1] and political power is "merely the organised power of one class for oppressing another".[2] Much before Gramsci, even Marx himself, in his writings, on the Bonapartist state in France, had propounded another view of the state according to which it may be independent of and superior to all social classes and have to some extent an autonomous role.

But this other Marxian view of the state in no way conflicts with the first view which regards the state as an instrument of class rule. In fact, these two views are complementary and can very well help to explain the role of the state in civil society in a structural sense as well as in changing class power situations. In this view, while Indira Gandhi, in a structural sense, may well be an instrument of class rule of the bourgeoisie as a whole in India, at the same time, she may also rule through a coalition of pressure groups which are composed of different factions of that class or its allies. Thus, there is no inherent contradiction in the two positions and it does not follow that a coalition of pressure groups cannot represent a specific class interest or a permanent interest alliance.

For this reason, the author's jibe at the Left, for 'its sterile and perennial debate about the class character of the Congress Party', would seem to have arisen more from ignorance of the central role of the class-state in explaining the dynamics of a capitalist society, than from any scientific irrelevance of the Left parties' political concerns.

Even Gramsci, on whom the author has relied for the proposition, has recognised the class-state and said: "The state is the instrument for conforming civil society to the economic structure, but it is necessary for the state to 'be willing' to do this; that is, for the representatives of the change that has taken in the economic structure to be in control of the state."[3]

Proposition 2 is an empirical generalisation based on the author's perceptions. But these may not necessarily be true or acceptable to Indira Gandhi or the Indian Left. The pressure groups around Indira Gandhi could hardly be shown to be the same or even similar to those of the Left except in a populist sense. Both pressure groups consist of groups of people who, in a democratic framework, exercise a right of vote and could equally affect the electoral chances of both Indira Gandhi and the Left. In this sense, and in this sense alone, the pressure groups around Indira Gandhi are the same as those around the Left. But in no other sense can they be said to be the same.

The similarity of policy positions of Indira Gandhi with those of the Left is only superficial, especially in internal matters. If examined in depth, significant differences of detail come to surface. Broadly speaking, Indira Gandhi's domestic policies are an anathema to the Left. At its last congress in Varanasi, the CPI has resolved to initiate and lead mass movements against the retrograde, pro-vested interest, anti-people and anti-democratic internal policies of Indira Gandhi Government.

Evidently, the perceptions of the author are different from those of the Left. With those differences in perceptions, it is hardly likely that proposition 2 can be universally acceptable.

Proposition 3 is again an empirical generalisation based on Indira Gandhi's return to power through elections in a democratic framework. But this must be appreciated, that Indira Gandhi's capacity to win elections and retain political power is as much attributable to the maintenance of a democratic framework as to her symbolisation of the 'spirit' of the erstwhile Congress Party. It was the same Indira Gandhi who was rejected at the 1977 polls although even then she continued to symbolise the spirit of the Congress Party. This means that Indira Gandhi has not become an *avatar* of the national freedom movement for all time to come. She has to win the confidence and affection of the masses on the basis of her concrete performance and policies from one Parliament to another. No symbols are eternal in human affairs. And perceptions of people, who watch over their political affairs intelligently, can change from one time to another. Thus, a time dimension has to be added to proposition 3 which is presently missing, and makes it appear as an absolute proposition.

From these considerations, it follows that proposition 4 cannot be held to be true for all time. It will be valid only for such period as Indira Gandhi's perceptions of India's interests coincide with those of her people. But, as has often happened in the recent history of several developing countries, if her perceptions deviate from those of India's working masses, it can be possible that her role as a historical force may not remain what it may appear to be today. There are too many instances in recent history of 'historical' personages losing their 'charisma' all of a sudden, with their magic over the masses suddenly disappearing. The Left has therefore to keep itself open to face such an eventuality if and when it arises, rather than put all its political eggs in one basket.

If and when a cleavage develops between the perceptions of Indira Gandhi and those of the working people, the convergence of political interests of Indira Gandhi and those of the Left could conceivably be disturbed and their cooperation adversely affected. This could be especially true because the class nature of Indira Gandhi's Government would remain operative all the while until she has created the countervailing power envisaged in proposition 7. And the class nature of her Government will tend to assert its policies all the time unless the Left is prepared to challenge them.

Thus, by strengthening the coalition of pressure groups around Indira Gandhi, the Left may risk strengthening of those pressure groups whose

May Day 1982

Industrial relations problems in India continue to be difficult, and May Day is the appropriate occasion to take a look. We present here the views of the Government, employers and trade union leaders on the problems and possible solutions. —*Editor*

Industrial Relations: Issues and Problems

BHAGWAT JHA AZAD

DEVELOPING societies characterised by poverty, unemployment, exploitation and inequality are striving hard to establish a new socio-economic order based on dignity and equality of man to ensure social justice and improvement in the quality of working life. These challenges call for greater commitment and dedication from employers, workers and others. Such dedication cannot come unless there is a reorientation of the traditional methods of management. Yesterday's management policies and practices cannot cope with today's problems of the work place. What applies to managements applies equally to trade unions. There is, therefore, need for a new pattern of management — whether of an enterprise or of a trade union — which may ensure a developmental and constructive role for the managements and workers.

Labour and social policy is an area where priorities must be established, choices made and values weighed one against another. It is an area where the opposing interests of more or less influential groups must be reconciled. This is an area of power struggle and hence the only practical and possible procedure is negotiation between trade unions, employers and Government. This is the institutional approach to development. In this progress of social negotiation, labour laws have a decisive role to play by creating the framework, the rules and the procedures under which such negotiation must take place.

The most notable characteristic in every field of activity is the constant attempt to reconcile conflicting views or actions to discover a workable compromise. In an industrial system, as in any other walk of life, there is no such thing as a fight to the finish. It is always a reconciliation exercise over differences. Even if the results of reconciliation are not totally satisfactory, efforts must be continued in future to ensure that the inadequacies are made up. In other words, the relationship between the employers and the employees should not be considered as a fleeting episode but a continuous playing of the game.

Industrial peace and harmony may have the same meaning, but while the former is somewhat negative and restrictive, and emphasises the absence of strife and struggle, the latter is positive and comprehensive. It postulates the existence of understanding, cooperation and a sense of partnership between employers and workers. A quest for industrial harmony is indispensable where a country has chosen the path of planning to secure economic progress. Economic progress is itself bound up with industrial harmony, for the simple reason that such harmony inevitably leads to more cooperation between employers and workers. This would naturally result in more productivity and thereby contribute to all-round prosperity of the country.

Healthy industrial relations on which industrial harmony is founded cannot, therefore, be regarded as a matter of concern only to employers and workers. It is of vital significance to the community as a whole. That is why the concept of industrial harmony involves cooperation not only of employers and workers but also of the community at large. Such cooperation stipulates that employers and workers recognise that although they are justified in safeguarding their respective rights and interests, they must also bear in mind the interests of the community. If this is the true scope of the concept of industrial harmony, it follows that industrial harmony ought to emphasise the importance of raising productivity because the resulting accelerated rate of growth will benefit the community as a whole. This is the true significance of the doctrine of industrial harmony in its three-dimensional aspects.

Attainment of development objectives can be facilitated by creating a climate of industrial harmony. Development itself has to strike a fair balance between stability, protection and distribution. Following from this approach to industrial relations, participative style of management assumes vital significance, as it encompasses industrial relations, policies which aim at cooperation between employers, workers and Government. In the land of Mahatma Gandhi, who enunciated the principle of trusteeship in industry, industrial harmony through a cooperative and consultative model is not incompatible with the relationship between employers and workers. Government's role in maintaining industrial harmony arises from its desire to bring industrial relations practices in line with the requirements of economic development and achievement of the objectives set out in the Five-Year Plans.

The author is Labour Minister, Government of India.

It is on this account that in India emphasis has been laid on negotiation, conciliation and arbitration of disputes and differences between employers and workers. Government action in this area can, however, be of a promotional nature and providing the infrastructure for settlement of disputes. The main burden would lie on managements and workers.

There are various issues confronting the industrial relations scene. Justice available to workers under the existing laws has to be speedy and the implementation of awards has to be done with grace and grit. Government is, therefore, considering what changes are called for to improve their working. To cite a few matters, the processes of conciliation and adjudication have to be simplified and delays reduced to the minimum. Besides, identification of a bargaining agent in an enterprise or industry and the provision of rights and responsibilities is an important issue which has so far defied solution. The National Commission on Labour had recommended the formulation of a Central law for the recognition of trade unions at enterprise and industry levels. However, there is a divergence of views among the central trade union organisations on the procedure and the machinery to be adopted for the determination of the collective bargaining agent. It is for this reason that Gavernment has not been able to come to a definite conclusion, as it wants to secure a national consensus on such a controversial matter before taking any concrete steps in this direction. Government has to see that the industrial laws are brought in tune with the needs of the present. The central trade union organisations should, therefore, give serious thought to this problem and come to some working arrangement. I consider it a challenge to them and they must accept this challenge to arrive at a commonly acceptable solution of this problem instead of taking rigid positions which make a solution difficult.

Another problem which often affects industrial relations is the multiplicity of trade unions in the same enterprise, each vying with the other to increase their membership and not hesitating in making exorbitant demands or adopting unconstitutional methods to have them fulfilled. This phenomenon of multiplicity of trade unions has weakened the bargaining position and resulted in their fragmentation at various levels. This is not a very healthy development in the trade union movement. Quite often, such multiplicity of trade unions introduces extraneous matters in the area of employer-employee relationship, a solution of which lies elsewhere.

One of the major problems of the modern industrial society is the alienation of workers from the work process. By doing a rapid and monotonous job day or night the workers become an appendage to the machine. From this alienation flow various evil consequences which affect not only the process of production but also the workers' way of life. To combat these evils, it is necessary to promote the involvement of workers in the process of production. The field of industrial relations is basically one of human relations and is not, therefore, fully amenable to legislation. Further, the human relations approach does not envisage only the relationship of one person and another at the same level of hierarchy but to the entire work-place upward and downward. It is now well recognised that a work-place or an industrial enterprise is a social system. There is also an awareness that very often management policies and practices aimed at increasing efficiency and productivity may have negative effects on the people at the work-place, if their aspirations and attitudes are not understood and utilised.

Instances where managements haxe brought about innovations in the field of employer-employee relationship are few and in many cases they are still following the traditional methods of management, notwithstanding far-reaching technological advances in the production mechanism. It is essential that the managements fully recognise the utility and the inevitability of the human relations approach and make a conscientious attempt to understand human behaviour at the work-place and utilise or modify that behaviour to achieve the objective of the organisation, while fulfilling also the aspirations of the workers. Such an approach based on a consultative and cooperative model can help in speeding up the process of integration of workers with the organisation and creating an awareness of the mutuality of interest for harmonious working. And yet how many managers can sincerely say that they follow such approaches for tackling the problems of industrial relations and accept the workers as indispensable partners in the production process? One glaring instance of neglect is generally the absence of an effective machinery for the redress of individual grievances of workers which, if allowed to continue unresolved, can eventually lead to explosive situations. The value of a grievance redress machinery has not been fully appreciated by many managements. Nor have they taken effective steps with a sense of determination to create trust and goodwill among the workers by following a participative approach and establishing participatory forums as an integral and an important ingredient of their industrial relations system to bring about an integration of the work-force.

In the field of industrial relations one cannot expect that there would be no disputes or differences. But it is for the managements to provide an effective system by which the disputes and differences can be sorted out speedily and that they are not allowed to accumulate. Discontent and frustration if ignored would only endanger the relationship and harm the industry. Their causes have to be patiently analysed and remedial action taken with the utmost expedition to create a sense of satisfaction among the workers and build up their loyalty to the industry. Personnel practices and their implementation should inculcate among the workers a feeling that the management believes in fairplay and justice. They should also render support to the participative system wherever introduced. Once the management has created trust among its workers it would have laid the firm foundations of a sound industrial relations system.□

Conditions for Industrial Harmony

SUDHIR JALAN

THE current labour situation in the country has been the major concern of everyone who is anyone. The number of man-days lost has again shown an uptrend. The provisional figures put them at 22.56 million as compared to 21.93 million in 1980. The production loss has been variously assessed, but the rough estimates indicate that in 1980-81, the loss approximately was of the order of Rs. 1390 crores. What has really been worrying the employers in particular is the violence, intimidation and coercion that are being used to settle industrial differences. Collective bargaining is no more respected and validly concluded settlements are being given scant respect. Management personnel are subjected to threats and gross humiliation, all leading to a state of insecurity. Obviously, production and productivity have badly suffered and it is unfortunate that the call of the Prime Minister to work cooperatively for nation-building has been lost in the wilderness.

There is not much point in going through the factors and causes that have resulted in this drift. They are well known. Horizontal and vertical split, mushrooming, inter and intra-union rivalries and deep politicisation of the unions are often cited as major factors. But there is another equally potent factor that has contributed to the present instability. Democratic values have collapsed and the civilised norms of conducting human affairs are rarely followed. Be that as it may, the isssue is whether the problems through which the nation is passing should not be the primary concern of all sections of the people, whether they belong to the working class, the employing community or the bureaucratic systems.

A look at the economic terrain will be useful.

Our population is 700 million now.

The percentage of people below the poverty line is somewhere around 50.3 per cent, of whom 260 million are in rural areas.

Unemployment is estimated at 22 million, of whom 5 million are educated.

The performance of infrastructure has improved and power generation is likely to go up by 11 per cent in 1982-83. Yet it is not enough to meet the active needs of our industries.

The general industrial growth has been placed at about 7.8 per cent, but it is not of desired level.

The foreign exchange situation has comparatively eased after the 5.6 billion SDR loan from the IMF.

The Railways have achieved a record freight movement of about 230 metric tonnes.

The total picture emerging from the above indicators is cheerful as well as depressing. From whatever angle we look at it, there is no room for complacency and all the scope for caution. In any analysis of the factors that would bring about stability in industrial relations one must keep these economic compulsions in mind. For, the quality of labour relations is far more significant than the size of investment, the type of technology and the adequacy of raw materials.

It is most surprising that the concept of 'partnership in progress' has not visited some sections of our trade unions, workers and their leaders. The current spate of industrial conflict that has battered and buffeted our industries clearly discloses the unhealthy drift in the trade union movement. One wonders whether the unions have become so inward-looking that they totally ignore the claims of society on the industrial products and profits. The era of peaceful satyagraha has been blown to pieces; instead violence, intimidation and extreme coercion have become the stock-in-trade of unions.

They have not hesitated to give a call for strike on the flimsiest grounds. Surprisingly, while employers and Government have been persistently advocating the cause of the vast unemployed and under-employed, the workers in the organised sector numbering 22 million, have used their strategic location in industry to pursue their sectional demands. It should be appreciated that no employer is against fair and economically equitable payments to workers. But the situation becomes pernicious when the pressure on industry is contrary to reason. How can one justify the strike in the 60 textile mills in Maharashtra in the face of an existing negotiated settlement that covers wages, bonus and working conditions and so on? It is beyond imagination how the industry is going to pay wage hike demands ranging from Rs. 450 to Rs. 650. Yet the unprincipled and upstart leadership has disrupted the smooth functioning of the textile industry, resulting in a production loss of Rs. 4 crores per day. This does not include the loss suffered by the processing units, textile machinery manufacturing units, dyes and chemicals producers and the loss resulting on account of the setback in export earnings. The strike as on April 18, 1982, had deprived the country of cloth production valued at Rs. 562 crores. The loss of exports is estimated at Rs. 50 to 60 crores. The industry has been denied its precious resources of about Rs. 50 crores by way of overheads. Workers themselves had suffered wage loss amounting to Rs. 62 to 65 crores.

What is being experienced in Maharashtra now is not new to the industrial and business community elsewhere. West Bengal accounted for the maximum time loss of 8.28 million man-days in 1981, followed by Tamilnadu (3.84 million) and Karnataka (2.42 million). Thus the three States together accounted

The author is President, All India Organisation of Employers.

for about 64 per cent of the total time lost last year.

In this view of things some specific suggestions are quite in order:

- There should be a halt to the enactment of further labour legislation. No doubt labour is a subject on the Concurrent List of our Constitution. But there are enough Acts which can take care of the usual and contingent labour situations.
- There should be stricter enforcement and implementation of the legislative provisions.
- Government should not hesitate to levy penalties on erring unions when they go on illegal strikes, just as they do not hesitate in launching prosecution proceedings against defaulting employers.
- Government should seriously consider measures that can be taken to bring about unification of the trade union movement in this country. There has been enough proliferation and splintering. One-union-one-industry situation is the ideal to be aimed at. That alone will help in maintaining harmonious industrial relations.
- Once unification of unions has been achieved, planned efforts should be made to contain the outside leadership of unions. There were very salutory provisions for this in the Industrial Relations Bill that lapsed in 1979.
- It shall augur well for trade union movements in the country to develop worker leadership.
- There is general agreement that in coming years collective bargaining should play an important role in the settlement of industrial differences. Both management and workers should make conscious efforts to give fair trial to the system which has functioned so well in the advanced nations. Here too, one union and a recognised negotiating agent are pre-requisites.
- There should be strict legal provisions that will put restriction on the unions which attempt to upset agreements and settlements arrived at with recognised unions. Maharashtra type of situations should be strongly dealt with.
- Trade unions must totally change their attitude towards development. The economic compulsions before the nation are so imperative that it can ill-afford sectarian pulls and pressures on the gains of industrialisation. They should realise that there are millions who need help and creative employment.
- Governments should not entertain any demands that cannot be economically justified nor should they compel employers to concede payments outside the ones provided by the law. Here I have in mind the annual suggestions made to the managements to pay ex-gratia bonus even after the same has been paid in terms of the Payment of Bonus Act.
- Last but not the least important is uniformity of labour laws in the country. There should be prior consultations with the involved bodies, whenever fresh legislation is contemplated by Central or any State Governments. I commend to the Central Government that they revive the Indian Labour Conference and the Standing Labour Committee so that there could be periodic and regular consultations with the employers and the workers on the future labour policies and legislation.□

Industrial Unrest: Causes and Cure

N.K. BHATT

THE extension of support by various trade unions, barring the INTUC, to the call for a Maharashtra Bandh on April 19 and the dismally poor response the call evoked from the workers, brings to the fore alarming trends in the country's industrial relations. The bandh call, in support of over two lakh workers in Bombay's textile industry, who have been terrorised and intimidated to abstain from work for nearly three months now, was given by the over-ambitious and unprincipled leader of the illegal strike, who has shot into prominence in the city's trade union scene by sheer muscle-power.

The textile strike is against the agreement between the Rashtriya Mill Mazdoor Sangh, sole recognised spokesman of the textile workers under the Bombay Industrial Relations Act, and the Mill Owners' Association arrived at in 1979 and valid till 1984. The agreement was the outcome of direct intervention by George Fernandes, the then Industries Minister at the Centre, and was blessed by Sharad Pawar, the then Chief Minister of Maharashtra. Yet these two leaders opted to support an agitation against the very same agreement.

Another aspect is that the leaders of the very same trade unions who in the recent past were highly critical of the State Government for not taking action against this unscrupulous trade union leader rushed to support the call for bandh given with the sole aim of establishing the supremacy of the same trade unionist who has all along been a law unto himself. By making false promises and misguiding the workers, this individual has done immense harm not only to the textile workers, but also to the future of a responsible trade union movement. The demand for high wages, particularly in the context of the prevalent wide disparities, appeals to the workers, but it is they, not the leaders, who ultimately suffer when they are deprived of even their normal wages. It will take years to undo the damage done by this individual who

The author is Member of Parliament and President, Indian National Trade Union Congress.

is concerned more with his political future than with the fate of the workers.

The case of Bombay's textile strike and the indirect encouragement from the Opposition trade unions have been cited only as an instant case to highlight the dangerous trends in industrial relations, which have come to be characterised by increasing resort to indiscipline, hooliganism, violence and intimidation.

This does not however mean that the working class has not played its part in the planned socio-economic activities in the country since Independence. Despite heavy odds, the country's working class has played a crucial role in ensuring that the wheels of production are kept moving. With their organised strength the workers have been striving to achieve distributive justice with a fair share in the gains of production, social security, education and other benefits for the weaker sections.

It is, however, a paradox that while labour has continued to play its legitimate role, there is a deliberate effort to whip up labour by putting it in the dock for all the ills of industry. The organised propaganda machinery has been given maximum play for projecting supposed or genuine lapses on the part of labour in an effort to conceal failures on the part of the other sectors of the economy. Management failures are more catastrophic. The managements have always been complaining of labour indiscipline, but there is growing indiscipline and inefficiency in the managements which are glossed over. The Government is unable to correct managerial indiscipline.

Another disconcerting trend that has been gradually assuming dangerous proportions is the growing sickness in industrial units, which is man-made rather than otherwise. By and large these units are in the private sector. The private sector has been always claiming the ability to efficiently manage and run industry and has been highly critical of the public sector. It would be interesting to make a study of this trend of deliberate efforts turn industrial units sick and then blame the workers for it.

It cannot be denied that there is an absence of the requisite awareness among trade unions of the crucial role they have to play in the socio-economic transformation of the country as a major segment of the social control system. There is a need for them to free themselves from the narrow sectarian shell in which they have been operating. They have to be in the forefront in mobilising public opinion and have to widen their vision and activities to cover the entire canvas for achieving human and social welfare. While striving to secure for the workers their legitimate rights and status, the leaders will also have to make them conscious of their obligations, taking into account the numerous problems like poverty, unemployment, inflation and rising prices confronting the country as a whole with a view to channelising the organised strength of the working class for overcoming the problems. There is, therefore, imperative need for the trade union movement as a whole to reorient its objectives with an integrated and positive approach and appropriate methods.

Dispute settlement should not be carried on between the management and the union in an atmosphere of mistrust or in terms of 'victory' for one side over the other. It involves efficient bargaining without any compromise on the legitimate dues of the workers. Failure or 'defeat' should be taken as an opportunity to begin again and not as an excuse for confrontation.

Collective bargaining and union-management cooperation is reflected in negotiations and hence should not be considered as a reconciliation with the established system. The very basis of collective bargaining is to provide a device by which new levels of rights can be secured. Therefore, the term collective bargaining calls for a fresh look since it has to cease to be a process of each party trying to outwit the other. It is an effective instrument for promoting harmony in industrial relations and joint action in new areas of joint cooperation. Cooperation does not mean absence of militancy; it only signifies mutual respect and recognition of interdependence for higher goals.

All collective bargaining agreements should have a built-in provision for voluntary arbitration either by a board or a single arbitrator as the parties prefer. At present, once direct negotiations fail, the alternative is either strike or adjudication. Adjudication is a time-consuming process, what with writs in High Courts and appeals to the Supreme Court. The involvement of workers in protracted litigation results in their losing faith in the grievance redressal procedure. The judgement of the Supreme Court invalidating the dismissal of a workman in the Mathura electricity undertaking is a concrete instance in this regard. The worker was dismissed in 1956 and the Supreme Court gave its verdict in 1981, that is, after more than a quarter century!

Adjudication is tortuous and frustrating, turning parties to production into parties to litigation, with the result that there is frequent resort to strikes and lock-outs. If voluntary arbitration becomes the normal course, then the prohibition of strikes or imposing adjudication would become entirely unnecessary.

Towards the realisation of the social objectives guaranteed in the Constitution, India has opted for planned economic development, ensuring in the process distributive and social justice. In this, the public sector has been assigned a pivotal role so as to occupy the commanding heights of the economy and bear the bulk of the burden of the industrialisation programme which will ensure the growth of ancillary industries and small-scale units with a balanced regional development and generation of employment opportunities.

The investment of Rs 97,500 crores during the Sixth Plan period is huge, and it is imperative that this colossal investment should be made fully productive. The nation's stake in ensuring the all-round success of the public sector is, therefore, very high.

Unfortunately, there is an absence of intellectual commitment to the philosophy behind the public sector among most of the existing management personnel. There is also lack of awareness about the role of the public sector in a developing economy. This is so because the top executives are often drawn from the administrative services who evince no interest in the performance of the units they are in charge of and conduct themselves as birds of passage. They treat the public sector units as transit camps on their way to getting posted elsewhere on promotion. Steps must be taken to recruit only those with ideological commitment to the public sector philosophy and the present management personnel must be made to undergo special training in the management of the public sector units with a view to injecting in them a new culture that would inform their approach and conduct.

There is a marked deterioration in industrial relations in the public sector. The approach to industrial relations in the public sector at present only lead to mutual mistrust. Some of the managements in the public sector are also to be blamed for the rapid deterioration in this regard. In an attempt to cover up their own failures, these managements have been encouraging trade unions that indulge in avoidable direct action and agitation to the detriment of production.

It is also unfortunate that trade unions owing allegiance to political parties which swear by the public sector are trying to wage their political battles on the trade union front and are thus harming the public sector.

The Marxist concept of class conflict and confrontation has no relevance in industrial relations in the public sector. With the radical changes that have been taking place in the country over the years, relations between labour and management in the public sector can never be based on conflict and confrontation. Labour's right to participate in management is enshrined in the Constitution. Participative management and Marxism cannot go together, for one is based on cooperation and the other on conflict. Industrial relations in the public sector have to be based on commonality of interests, on cooperation. The need is for a radical change in the basic philosophy guiding industrial relations in the public sector.

Planned development is the cornerstone of a socialist society. Our development will become meaningful only with fuller involvement and active participation of the people at all levels. This has to mean deeper involvement of the workers in the planning process for increased production and productivity which alone can redeem the country from a situation of low production and high prices. The pre-requisite for our cherished ideal of economic and social democracy is industrial democracy. The present anarchy in industrial relations makes it all the more imperative to hasten the participative process which will ensure workers' involvement in all decision-making processes right from the shop-floor level to the highest level. Such a process alone will ensure motivation for raising the levels of productivity and improving the performance of the enterprise, at the same time safeguarding the legitimate share of the workers in the gains of higher productivity.

We are on the threshold of a decade which can usher in either hope or despair. Hope is the only harbinger for growth and prosperity. This hope can be kindled and preserved by the mighty efforts of the working class who can no longer forget their rights and privileges. □

Towards Intensified United Actions

INDRAJIT GUPTA

THE present decade, the Nineteen Eighties, has opened up new prospects of intensified united action by the working class on economic, social and political issues, for trade union and democratic rights and against the war danger posed by Imperialism.

A little more than three months ago, on January 19, 1982, the first national general strike since our country won its independence was carried out at the call of the National Campaign Committee comprising eight trade union centres and 40 industrial federations. Between 10 and 12 million workers in the public and private sectors stopped work for 24 hours, representing about 50 per cent of the workforce in the organised sector. This is a historic event in the long annals of the Indian trade union movement.

The strike was widespread in the steel and mining industries, ports and docks, oil and petroleum establishment, road transport, electricity undertakings, newspapers, engineering, chemical, cement, sugar, and textile mills, as well as in hundreds of thousands of small-scale, "sweated" industries. It was 100 per cent complete in the banks and insurance companies.

Besides, the strike was actively supported in large areas of the country by agricultural labour, teachers, students, women, and small shop-keepers, as a result of which colleges, schools, university campuses, and markets were closed.

Hundreds of thousands of workers who struck work knew they were liable to severe legal penalties including dismissal from their jobs and imprisonment up to six months under the provisions of the Essential Services Maintenance Act, 1981, which has virtually imposed a blanket ban on strikes in the so-called "essential" services. But the Government's threats and intimidation did not cow them down. High tribute must be paid to the invincible fighting, class spirit of the working people.

At least 50,000 were arrested, hundreds beaten up by the police for peaceful picketing and demonstrations, 19 lives were lost on the strike day in firing and clashes provoked by strike-breaking rowdies. The National Security Act, which we were assured would never be used against trade union activities, was misused right and left to arrest trade union leaders and cadres and to detain them without trial. The leaders of the ICFTU-affiliated Indian National Trade Union Congress went all-out to oppose and break the strike. An unprecedented barrage of false and slanderous propaganda was unleashed by the official media, and the radio and TV stations all over the country were directed to play down the success of the strike.

The author is General Secretary, All-India Trade Union Congress.

These facts themselves testify to the sweep and militancy of the strike action. In only some sectors, particularly of the Government employees and public service workers, the impact of the strike was comparatively weak due to weakness of organisation though not of spirit.

The National Campaign Committee of trade union centres and industrial federations took shape at a convention in Bombay attended by 4,000 delegates in June 1981. It formulated a 13-point charter of demands which included not only specific demands of the workers relating to Government's wage-fixation, cost of living allowances and bonus policies, not only to problems of unemployment, closures and retrenchment, guarantees for collective bargaining and trade union rights and repeal of all repressive measures, but also demands of a broad, democratic and popular character relating to reduction of high prices, strengthening of the public distribution system, remunerative prices for farmers, guarantee of minimum wages and job security for agricultural labour, and stringent measures against black money operators and corrupt officials.

On the basis of these demands, hundreds of meetings and State-level conventions were organised throughout our vast country, culminating in a million-strong demonstration before Parliament on November 23, 1981. The subsequent strike on January 19 revealed that the democratic masses in India are eager to accept the leadership of the working class for a broad united action which concentrates on vital policy issues affecting the lives of millions of working people. It was precisely because of this significant feature that the one-day strike action incurred the frenzy and wrath of the Government and the monopolists. This also explains the post-strike offensive of victimisation, of suspensions, dismissals, pay-cuts, break-in-service, and police cases, which has been launched in many enterprises, and which has now to be firmly and unitedly resisted by appropriate forms of action.

Of course no one imagined that our goals could be achieved by a single, one-day mass action. We have to prepare for a sustained movement capable of adopting multiple forms to meet the requirements of the situation. The platform of trade union unity represented by the National Campaign Committee must be strengthened and broadened. The developing unity between the working class and other democratic sections must be raised to a higher level. Another small, but encouraging, symptom of the growing urge for unity is the fact that the Indian delegation to the recent UFTU Congress at Havana comprised not only the AITUC, but also the non-affiliated centres — CITU and HMS — as well as the independent federations of bank employees and college teachers, all of whom were active participants in the united strike of January 19.

At the same time, one crucial test of class consciousness is the capacity of the movement to resist and fight back the variety of disruptive and divisive forces which are seeking to divert and weaken the workers' unity on the basis of communalism, casteism, separatism, regional chauvinism, etc. These undoubtedly constitute a serious menace to the essential oneness of the trade union movement, and they have repeatedly succeeded in provoking fratricidal riots and tension in some major industrial centres. Constant vigilance, strong mass bases, ideological propaganda, and refusal to compromise with avowedly communal forces (some of them within the trade union movement itself) are an essential part of the struggle for working class unity.

The catalyst which is stimulating the forces of unity and united action is, of course, the impact of the worsening capitalist crisis and the intensified offensive of the monopolies and the transnationals. India is no exception to this process of development. It suffers from all the consequences of underdevelopment which are today characteristic of the non-oil-producing Third World countries — low purchasing power of the broad masses, chronic and growing unemployment, a severely restricted home market, inability of native industries to compete in the international market, a heavy import bill and crushing burden of trade deficit, growing dependence on external loans, a high rate of inflation which brings gains only to the monopoly sector, uneconomic prices for the farmers and producers of commercial raw materials, and domination of the wholesale trade by powerful groups of speculators and hoarders of essential commodities.

In the name of fighting inflation and securing access to export markets for the products of Indian industry, the Government and the monopolists are advocating so-called "austerity" and "economy" measures based on the notorious wage-price spiral theory which is dear to the heart of bourgeois economists all over the world. Thus, the Sixth Five-Year Plan (1980-1985) of the Government of India, which, incidentally, was not even allowed to be debated in Parliament at its draft stage, speaks openly of the "need for bringing about a greater rationalisation of the wage structure and linking of wages at least in some measure to labour productivity". This is another name, if not for wage freeze, at least for a restraint on higher wages; although the consumer price index (1960 = 100) has risen above 460 points and continues to rise, the Government has recently revived the idea of paying only a portion of cost-of-living allowances in cash, while forcing its employees to deposit the balance with the Government for future payment in instalments. Social security legislations are planned to be amended so as to reduce the present benefits.

A number of collective agreements in key sectors like steel, coal, banks, BHEL, etc., will be expiring by August/September 1982. Their managements have already indicated that no new wage increases will be approved unless they are linked with productivity. Unless this official attitude changes, there is every likelihood of major confrontations taking place in these vital industries.

Emboldened by the Government's attitude, the monopolists are trying, in the face of the workers' stubborn resistance, to maintain a high rate of profit by reducing the work-force, increasing workload in the name of rationalisation, and cutting down of existing benefits and privileges. It has become a profitable practice to mismanage and fleece a company until it is declared a "sick" undertaking, after which the entire responsibility devolves on the Government to revive it to health with massive injections of public funds. The number of such "sick" units as on December 31, 1980, was 24,656.

As recently as on January 30, 1982, 58 textile mills (47 cotton and 11 jute) employing a total of 113,000 workers were lying idle, either completely closed down or locked-out by the employers on grounds of alleged losses or of labour "indiscipline". The entire work-force involved has been thrown on the streets without any compensation. According to the Government itself, about 46.26 million people would need employment at the end of the Sixth Five-Year Plan in 1985.

At a time when 50.82 per cent of the population of India is somehow existing below the poverty line (which approximates to a monthly per capita income of roughly Rs 70), the assets of the large industrial houses increased by 45 per cent during the three-year period ending 1980. The two largest monopoly houses in India, the Birlas and Tatas, have increased their assets by more than 200 per cent between 1966 and 1980.

It is mostly these large industrial houses which act as the vehicles for transporting the foreign multinationals into the Indian economy via collaboration agreements. There are at present more than 6,000 such agreements in operation, representing partnerships for production, export promotion, or technical expertise between Indian partners and about 1,000 US, British, French, West German, Japanese, Dutch, Swiss, Canadian and other firms in diverse fields such as drugs, fertilisers, aluminium, tyres, cosmetics, food, hotel-chains, detergents, electronics and so on. Moreover, the penetration of multinationals is not confined to the private sector, but has extended to vital public sector undertakings also.

In the last four years, multinational companies operating in India have remitted to their head offices about 577.33 million dollars by way of profits, dividends, royalties, fees for technical know-how and interest payments. US investment in India now totals 350 million dollars, second only to the UK. According to the American Chamber of Commerce, between 1975 and 1980, sales of 30 US equity investments in India increased at an average annual rate of 16 per cent, gross profits averaged 15.2 per cent, and dividends 19 per cent.

The threat to India's economic self-reliance and independent development has sharply aggravated with the recent sanctioning of an unprecedentedly massive loan of 5.8 billion dollars to India by the International Monetary Fund. Though all the terms and conditions of the agreement have not been made public, it is well known that among the so-called "conditionalities" of the IMF are the obligation of the recipient Government to create a more favourable atmosphere for private foreign investments, export-oriented production, further liberalisation of imports, lower subsidies for public services like railways, posts and telegraphs, urban transport, etc., and a cut-back on uneconomic public sector undertakings, and a rationalisation of labour laws leading to improved production discipline.

Already, foreign investors and their journals are waxing eloquent over their future prospects in India, while the working people live in dread of further burdens and tightening of their belts.

At the same time we must admit that the situation would have been even worse and the depth and manifestations of the capitalist crisis much more acute, had it not been for the extensive, all-sided and expanding cooperation between India, the USSR and other socialist countries in the fields of industrial development, science, trade and commerce. The Soviet Union, in particular, by selflessly aiding India to establish and expand key public sector projects of heavy and basic industries, by providing valuable technical know-how and training of Indian cadres, and by extending most favourable terms of trade to India, has created positive conditions which can and should be utilised by the Indian people to resist and defeat the aggressive inroads of the transnationals and of international imperialist agencies like the World Bank and the IMF.

It is high time for the trade union movement to move from general propaganda against the dangers of the transnationals' offensive — the essence of modern neo-colonialism — to concrete initiatives and actions. We must admit that we are still lagging behind in this respect. Coordinated action in different countries as also on regional levels against particular multinationals should be given high priority by the Indian trade union movement.

The working class in India is seeing the evil expressions of the Reagan doctrine in our region in the arms build-up of the military dictatorship in Pakistan, the proliferation of US bases and naval activity in the Indian Ocean, the undeclared war, launched from Pakistani soil by armed mercenaries against the revolutionary regime in Afghanistan, and the continuing Sino-US intervention against the people's Republic of Kampuchea on behalf of the genocidal Pol Pot clique. All these are integral parts of the global strategy of the US imperialists who are today also threatening to attack Cuba and El Salvador, and are shamelessly supporting the South

(Continued on page 22)

Problems of Organisation and Consciousness

B.T. RANADIVE

MAY Day this year will reveal the innate weakness in the consciousness of the working class and the trade unions.

The international working class and the people of several countries will celebrate the day as an anti-war day and a day for preserving peace.

The aggressive plan of US imperialists to place missiles in Europe in preparation for a war against the Soviet Union and the Socialist countries, and the prospect of a nuclear war in which the entire humanity might be involved, has raised united protests from thousands of people in Europe and the USA and led to big popular movements for peace. The working class and the people of the Soviet Union and the Socialist countries together with their governments stand by the people of the world in the fight for peace.

But it cannot be said that the trade union movement in India and all its major organisations are alive to these vital problems. Only the CITU and the AITUC and a couple of other central organisations will rouse their workers to the danger of war and their international duty. The rest will confine themselves to some immediate demands and ignore the international challenge of war.

The 'nationalisation' of some trade union leaders has corroded the consciousness and led to the isolation of large sections of India's working class from the main international current; notwithstanding repeated pleasure trips of these leaders abroad.

The war clouds have also reached our borders and the arming of Pakistan by the US imperialists presents a threat to the Indian people. But perhaps even this fact is not properly known to the mass of workers and the trade union leadership of many trade unions can be justifiably charged with neglecting the international task as well as duty towards defence of the freedom of our country.

The year that has gone has seen a tremendous tussle between the organised trade union movement and the anti-labour policies of the Indira Congress Government. Last year saw the wearing out of the illusion arising out of Indira's return to power and the working class again resumed its strike struggle. The number of man-days lost in 1981 went beyond 25 million, 4 million above the 1980 figure, though it was lower than the 1979 figure. The number of man-days lost in the public sector almost doubled since the preceding year. The increase in strikes and man-days lost was inevitable because of the economic conditions as well as the policies pursued by the Central Government. The Congress-I Government regards every trade union dispute as a law-and-order question. Outright repression and illegalisation of militant struggle is

The author is President, Centre of Indian Trade Unions.

the basis of the labour policies of the Indira Government. The use of NSA against the Loco strikers and the enactment of the ESMA remind one of the Emergency regime so far as labour is concerned.

But the bourgeois-landlord Government follows other methods also to repress the organised movement and drive a wedge between it and the people. It carries on ideological propaganda against trade union demands by proclaiming a fake income and wages policy. It exercises pressure on all agencies—private employers, private sector banks, Government departments, nationalised sector — to oppose the economic and organisational demands of the workers. It launches attacks on the gains already secured by the working class, buying over some pliant leaders. It bars increase in wages and due compensation against inflation and price rise and makes administrative provisions for imposing the burdens of high prices on the working people. It attacks the concept of collective bargaining and assumes arbitrary powers, leaving hardly any scope for the employees concerned to negotiate.

Similarly, it uses state power and its patronage to recognise only its agencies as leaders of the working class and directs private employers also not to deal with unions with mass following. The Bombay textile strike involving more than two lakh workers which is now three months old completely exposes the partisan and arbitrary policy pursued by the Government in relation to recognition. The strike took place in spite of the opposition of the recognised union, the favourite of the Government affiliated to the INTUC. The entire mass of workers joined the strike and repudiated the leadership of this recognised union. The strike continued for nearly three months under the leadership of rival unions but the Government insists that only the disowned union will continue to represent the workers and refuses to open talks with the union which is conducting the strike. And these are the people who talk of Productivity Year; they express their concern for increased productivity but they are prepared to sacrifice crores of rupees worth production if the workers repudiate their present leadership. It seems under the Congress-I regime the people have the right to vote for a Government of their choice but the workers have no right to vote for the union of their choice.

The Government further does everything to give monopoly of representation to its own agents to represent the Indian labour movement abroad so that the real voice of the Indian working class does not reach international gatherings. This is necessary to prevent the exposure of Indian labour legislation with its farcical provisions and implementation machinery. The growing collapse of this legislation shows that formal acceptance by the Government of India of international conventions does not change by an iota the worker's life in India.

Last year the trade union movement had to contend against this policy and wage innumerable struggles. It may be said that the outstanding feature of the year that has gone is the achievement of united action and trade union unity. There was a break with the morose conditions of the earlier year when some central trade union leaders, reeling under the defeat their political leaders had suffered in the 1980 elections, were chary of mass actions.

The CITU steadfastly worked for united action and, helped by others, was successful in giving a push forward to trade union unity. The Bombay convention was a very important step in the direction of unity. Never before had so many organisations covering different industries, central trade unions and federations together with the organisations of employees, come together to voice their common protest against the anti-labour policies of the Government and champion the demands of the people, the peasants and the agricutural workers.

The massive unity demonstrated on November 23 last when lakhs of workers gathered in the Capital to voice their protest and the demands raised on behalf of the people and the call for strike marked yet another step in the unity and consciousness of the trade union movement. The demonstration included hundreds of working women coming over long distances to the Capital and reflected the new awakening among women workers which was made possible by CITU unions devoting special attention to their problems.

The unity demonstrated on January 19 to implement the call for strike was unprecedented in trade union history. With the support of major Opposition parties the strike became a complete bandh in many places, drawing tens of thousands of shopkeepers, hoteliers, lawyers and professionals.

The demands raised by this strike were significant and conformed to the international trend of merging of working class demands with the demands of democracy and living standards of all sections of the downtrodden.

By combining the demands of the workers with the pressing demands of the peasants and the agricultural workers, with the demands of the suffering people against fleecing prices, the trade union movement is taking steps to unite all sections who are leading a miserable existence under the bourgeois-landlord ruling and authoritarian party and seeks to discharge the responsibility of the working class towards the people.

The strike against the NSA and ESMA gave expression to the working class protest against the authoritarian regime and its determination to defend the democratic rights of the people.

No wonder the government came down with a heavy hand against the workers. More than 60,000 workers — 20,000 in Kerala alone — including trade union office-bearers, were arrested and put behind bars. INTUC leaders were active in breaking the strike and attacks by anti-social elements against the workers were common. Ten workers fell victim to brutal police firings.

Organisationally, the weakest part of the strike was the Railway and Central Government organisations including Defence organisations. The leaders of these organisations could not make up their minds to join the strike though many of them had earlier supported the call and also decided to join it. In West Bengal, Tripura and Kerala, however, these employees joined the common action in a big way.

Among the State Government employees the strike evoked magnificent response in West Bengal, Kerala, Maharashtra and Tripura. In other States there was hardly any response.

These weaknesses have to be removed. Unless this is done they are likely to prove extremely dangerous to future growth and encourage the Government to launch a general attack on the present gains of the workers.

The Government is already busy at the game. Exploiting the weakness and meekness of these leaders, the Government has enforced compulsory deposit scheme of arrears of Dearness Allowance on the Central employees. This will be soon used as a precedent first in relation to the Central Government employees and then in relation to all sections of employees and workers. It was the same leaders who let down the workers by agreeing to link bonus with productivity, and now the Government is intent on introducing this principle in all industries.

It is necessary that the central trade unions and federations hold a dialogue with these leaders to make them aware of the great harm done to the trade union movement by their policies. Above all, it is necessary to make an ardent appeal for unity and common action to the mass of Central Government, State Government, Railway and Defence employees to fight for their demands shoulder to shoulder with the rest of the working class, to fight unitedly for the common demands of the workers and the people.

It may now be safely assumed that through the united protests the trade unions and federations are realising that they are now face to face with definite economic and political policies of the Government which can be combated only on the basis of their class strength. Questions of rising prices, inflation, deficit financing, imports and exports policy, IMF loan or ESMA and NSA are not matters that can be remedied by a section of the working class. To combat them the working class should face the Government unitedly as a class. This is the realisation that is seeping to the movement through the experience of common action, especially the historic January 19 strike.

This consciousness has to be carried forward—the process of trade union demands merging with general democratic demands, the process of trade unions coming out as champions of the peasantry has to be carried forward. If carried forward consistently, it will result in important political developments, placing the initiative in the fight against authoritarianism with the working class.

The January 19 strike itself revealed the possibilities of united working class actions broadening into people's actions against the authoritarian regime. The decision of the organised trade union movement to go into united action, the certainty that the action will embrace lakhs of workers, evoked support from the Opposition political parties and led to the participation of wide sections of the people including the peasantry. The championing by the trade unions of the demands of the peasants, agricultural workers and the people immensely widened the scope of the action.

There must be firm resolve to carry forward this heritage of the January 19 strike. The working class, if it is to be true to its class and its people, must courageously face the immediate problems that confront the country. At the centre is the grim fight against the authoritarian regime.

Certain sections of the working class, the working class of West Bengal, of Kerala and Tripura, have been in the forefront of this struggle defending the Left Ministries and frustrating the designs of the Congress-I Government against them and protecting these advanced outposts of democracy.

The coming elections in West Bengal and Kerala call upon the working class in these States and the entire working class of India to do everything to defeat the Congress I and ensure the victory of the Left forces and their allies.

The performance of the Left-led Ministries in these States is now well-known to the Indian people. They loyally stood by their electoral promises, protected the workers' right to strike, refused to employ the police in industrial disputes or any democratic and economic agitations of the masses and condemned both the NSA and the ESMA. These acts of theirs made them advanced outposts of democracy fighting against the attacks of the authoritarian party.

This May Day calls upon the working class to attend to other challenges also.

The imperialists are at their old game of disrupting the country's unity. In Assam they are promoting secessionist movements, exploiting the economic backwardness of the people; in the Adivasi areas they are doing the same with the help of some foreign Christian missions; inside the country they are financing Hindu communal organisations to cause the resurgence of Hindu orthodoxy. The RSS plays the same game and the Jamiat-e-Islami, proponent of Islamic fundamentalism also helps the imperialists' game to divide the country on communal lines. The oppression of Harijans also contributes to this disintegrating process in a big way.

This disintegration of the struggle of the common man and the disintegration of the nation's unity are intended to help the imperialist plot to re-enslave the country. The working class has to fight against this danger by fighting the communal and casteist forces as it has to fight the danger to the country's freedom from outside emanating from the feverish arming of Pakistan's dictatorial regime.

The working class is best suited to serve the nation because its class organisations can unite all communities and castes. Only, they should learn to pay more attention to the demands of the oppressed communities and castes.

It is obvious that the present state of organisation and consciousness of the trade union movement is totally inadequate to meet the grave problems confronting the country and the working class. The international consciousness of the trade union movement is at its lowest. Its awareness of the problems facing the people is also not very high. It seeks unity on day-to-day demands but there is no serious effort to bring all organisations under a common umbrella. The call given by the CITU for a Confederation of Trade Unions has not evoked any response. But the sincerity with which all the constituents of the National Campaign Committee, that common body of central trade unions for joint actions, and the Federations worked to implement the decisions of the Bombay Convention and the January 19 strike call, increase the prospects of rapid progress in this direction.

The next year is likely to see big advances in both consciousness and organisation.□

Government Employees' Constraints

O.P. GUPTA

TRADE Unions amongst Government employees and their struggles for economic improvement is going to play a significant role in the trade union movement in the country. They will be required to bear the main brunt in the struggle against the Government's economic policies as, unlike private employers, the Government will not be able to give economic relief to its employees. While private employers have been able to improve the wages and conditions of service of their employees by sharing the loot of national wealth through concessions and price rise, the Government is not able to meet even reasonable demands and keep up parity in wages.

Out of the total working force of 247.56 lakhs in the country, the Government directly or indirectly controls more than two-thirds, as is evident from the following:

	1961 lakhs	*1971 lakhs*	*1981 lakhs*
Central Government	20.90	27.71	31.96
State Government	30.14	41.52	56.11
Quasi-Government	7.73	19.29	45.49
Local Bodies	11.73	18.78	21.25
Total	70.50	107.31	154.81
Public Sector		15.75 (1976-77)	18.38
Private Sector	50.40	67.42	74.37

Source: Economic Survey 1981-82.

Unfortunately the central trade unions, partly because of split on a political basis and partly because of the limitations imposed on the trade unions of Government employees, are not able to provide an effective lead. The inability of Government employees to participate in the January 19 strike and the heavy repression let loose upon them after the strike, reflect this reality. A deeper study of these realities is needed.

The trade union movement among Central Government employees has not as yet acquired homogeneity despite the fact that since independence, all sections jointly organised strikes in 1960 and 1968. The Confederation of Central Government employees formed in 1955 has grown in size and is looked upon with respect by many workers, particularly white collar labour, but it has not yet become an effective instrument. A few months ago, its Secretary-General wanted to resign and leave the organisation, saying it had lost its utility.

The non-participation of Government employees in the January 19 strike and soon thereafter the acceptance of the Government's DA offer, has not only created controversy about the credibility of the movement but exposed the weakness of the whole movement. The leadership of the Government employees' unions have been subjected to severe criticism by the leader of the National Campaign Committee representing various national trade union centres without realising their limitations.

Trade union movement among Government employees is over 70 years old and has been greatly influenced by the British trade union movement. British workers who came to India as a part of the exploiting administration, set up an organisation to improve their lot particularly in the Railways, Telegraph and other departments. They were greatly influenced by the labour Party. In their turn, they influenced the Indian employees. Despite the fact that the economic condition of the Government employees vis-a-vis the poverty of the Indian people under British raj was not bad they could not tolerate for long the discriminating behaviour of the Government. In this they were encouraged by the Indian National Congress. Gandhi's non-cooperation movement and political struggles of 1921, 1932, 1942 etc helped the growth of militancy in the movement. While very few Government employees resigned from service on Gandhi's call, in their limited way they roused consciousness and patriotic urge among the employees which on economic issues went into action as early as 1908.

The Railways were managed by private British companies and were taken over as a nationalised service after 1945. Therefore the development of trade unionism among them has been more on the industrial pattern and not as in the case of civil servants. Only after the second Central Pay Commission did Railwaymen start behaving as Government employees (though not as civil servants). Even today they are not emotionally integrated with other civil servants despite the two strikes in 1960 and 1968 which were fought under a common banner. Both because of the size (they are more than 50 per cent of public servants) and being an operative service, their role will always be somewhat different.

Among the remaining Central Government employees the bulk and best organised are the Post & Telegraph employees. The P & T service, unlike the Railways, has been state-owned ever since its

The author is General Secretary, National Federation of P & T Employees.

inception. Its affairs were conducted on commercial-cum-utility service where in the postal wing the charges of services are fixed below cost and the department is expected to make good the loss. Consequently, in respect of wage and service conditions, the P & T workers are discriminated against as compared to other civil servants. Therefore, their trade union, while facing the limitations of the British rules for the civil services, had to organise struggles to improve their service conditions.

Among the remaining civil servants, unions on association pattern grew as in Audit, Income Tax, etc.

Till the Second World War there was not much stir among these employees. In 1946, the massive postmen's strike all over the country and the complete P & T strike in West Bengal, Assam and some other parts of India gave an impetus to the freedom movement.

In the background of the political upsurge, the first Central Pay Commission was appointed in 1946. There have been two more CPCs, one in 1960 and the other in 1973. The Pay Commission, while removing many disparities, failed to give a fair deal to the operational staff and therefore there were strikes in 1960 and 1974.

The 1960 strike exposed the inadequacy of the negotiating machinery in the Government services. Despite Prime Minister Nehru's assurance, this machinery was not created till 1966. However, the Government's refusal to refer the dispute to arbitration provoked the workers to organise a one-day token strike in 1968.

Lack of cohesion in the Government employees' trade union movement is not merely a national phenomenon — it exists all over the world though except for the fact that there is a common employer and wages are broadly similar there is nothing in common. But these two aspects — common employer and consequently joint negotiating machinery — compel the movement to adopt a united stand and if possible a common programme.

The Government employees are governed even today by British-made Conduct Rules which prohibit participation in political activity. Except for the Railways which brought a tradition of trade union functioning from British days and the Defence workers who are treated as industrial workers, Government employees are not permitted to affiliate their organisations with national TU centres. They are also not allowed to form unions on communal or caste basis. These limitations have proved a blessing in disguise as they have helped the workers in civil services to avoid split on a political basis. Only after the 1968 strike and later under the Janata Party was some political bias injected.

These restraints and limitations have also influenced the approach of the trade unions. Outside the Railways and Defence, the National Federation of P & T Employees plays the most effective role. Its attitude also influences the decision of the Railways and Defence on common issues. The NFPTE has acquired this unique position by hard and devoted work. The correct tactics adopted by the NFPTE in evolving its approach not only towards the Government but also in respect of the struggles of the workers to win their demands have been vindicated over the years.

Its approach to the Government is from issue to issue, that is, neither total loyalty to the Government like the INTUC nor permanent hostility like the Left trade unions. Its support to Emergency was neither for seeking favours nor out of fear. This approach has kept a vast section of employees with varied political leaning firmly loyal to the NFPTE.

Because of the balanced approach — middle of the road line — it has been subjected to repressive measures by the Government on the one hand and to criticism by political elements on both Left and Right on the other.

Even during Emergency, despite its support to the regime, the NFPTE refused to yield to unfair pressure from the Government and became a special target of attack. Its journals were destroyed by burning, the elected office-bearers were not recognised for years together, and funds of the union in the Post Office Savings Bank Account were allowed to be withdrawn by a rival group.

On the workers' struggle also the NFPTE adopts a realistic approach. The NFPTE was committed to the programme of the National Campaign Committee for the January 19 strike. The limitations on the conduct of civil servants and the fact that the Ordinance had a direct bearing on them

considerably dampened their determination. Therefore the NFPTE did not hesitate to call for restraint and, despite pressure, it showed its participation by holding mass rallies and meetings of workers including those politically loyal to the Congress.

The NFPTE favours settlement through negotiations but does not hesitate to organise a strike when it becomes necessary. Through this policy it has secured for its employees great respect in the ranks of all Central Government employees. It does not boast or take a back seat but moves in a determined manner when required. It is because of this that in both the 1960 and 1968 strikes P&T workers' contribution was the maximum. Even in 1981, soon after the Ordinance was promulgated and before the NCC could take up cudgels, P&T workers prepared themselves to organise a non-cooperation movement. The workers' unity and determination to act was so great that Minister C.M. Stephen declared that the Ordinance was not sufficient to handle the situation.

Government employees are today the worst paid section of salaried workers. Not only wages in the public sector apart from banks, LIC, etc., have improved but even some State Governments have granted better scales. Most of the Central Government employees are in operative services like the Railways, P&T, Defence. Therefore the Government cannot continue to deny them parity in wages with the public sector undertakings. The Government has agreed to settle this demand by March 31, 1983.

The NFPTE has no illusion that the Government will accept the demand out of goodwill, and it is therefore determined to unify not only its own ranks but also other sections of Government employees including Railways and Defence to create sufficient pressure and to organise an effective struggle thereafter if the Government tries to back out.□

Towards United Actions

(from page 17)

African racist regime as well as the Israeli aggressors who have illegally annexed the Golan Heights.

But all these crimes and conspiracies against peace and national independence of the peoples are bound to fail. While the situation calls for heightened vigilance without relaxing for a single moment, what is more urgently required is still greater unity of will and purpose, stronger determination, better coordination of mass actions and popular struggles against the common enemy and refusal to be duped by his deceitful manoeuvres and lying propaganda. Our trade union movement must bring the organised working class into the front line of battle against the war-mongers. We express our full support for, and solidarity with all the peoples fighting against imperialism, colonialism and aggression, whether it be in Asia, Africa or Latin America. We stand for the defence of our own country and its security against any imperialist threat or attack, and for consistent carrying-out of India's policy of non-alignment and peace.

We support wholeheartedly the tremendous initiatives being taken by the Government of the USSR in favour of genuine disarmament, relaxation of international tensions and a negotiated solution of outstanding issues which threaten the peace of the world.

In the period ahead, the working class will thus have to combine its tasks of fighting the anti-labour policies of the Government and employers, and for better living and working conditions, with the task of safeguarding the security and integrity of the country and against the dangers of war and destabilisation created by the imperialists.□

Agrarian Women : Unanswered Questions

ANJALI DESHPANDE

IF you believe the Government of India, only 31,339,000 women out of a total 263,352,000 are economically active. The rest, so to speak, are economically idle.[1] The enormous household industry, which consists of cooking, washing, cleaning, tending the sick, child-rearing, does not bring in any monetary returns to the exchequer and therefore it is found proper to declare that a minute percentage is active in economic terms while the rest live as burdens. The fact is ignored that it does save the exchequer a considerable amount of currency which would have to be spent on maintaining and staffing kitchens, dormitories, nursing units for the sick and nurseries to rear future workers, if women were not available as chattels.

Of these 11.9 per cent 'working women', a large number work on the fields. The Ministry of Labour records that of the total working population of 180 million only 31.3 million were women according to the 1971 census. The break-up of the recent census is yet to be made available. As compared to the 149.2 million male working population, women constitute just a little above one-fourth of the total working force. That is where the Labour Ministry stops — and that is where agricultural labour unions should take up studies.

But the main problem with writing anything about women agrarian labour is that despite thirty-four years of self rule, and over a score years of the existence of numerous kisan sabhas, no comprehensive study of the nature of work women do and are allowed to do in rural areas is available. One would expect the Left to show some interest and do some work by themselves on such delicate issues like data collection, without relying entirely on Government figures or the methodology by which statistics are arrived at. But 13 years of the Bharatiya Khet Mazdoor Union (BKMU) which was formed by splitting the Kisan Sabha, mainly on class lines, has yielded nothing on the subject of agrarian labour, leave alone women agrarian labour. It is the same sad story with the other major Left party, the CPI-M.

The vital importance of women labour in agriculture is indicated by a small occurrence recorded in the pocket book of labour statistics. The average number of workers employed in coffee plantations in 1976 is shown to be 60,0 0. The figure suddenly dips to 31,000 in 1977. The explanation for this decrease is given in a footnote that reads, 'The employment in coffee plantations is less during 1977 due to non-availability of women employment figures for Karnataka State'. If the number can fall by one half because figures of women employed in one State (although in this case Karnataka happens to be the major coffee-producing State out of four such States), it shows that nearly half the labour employed in coffee plantations is female. Another corollary which carries more significance is, why were figures of only women labour not available when the number of men employed in the same year is recorded as 20,000? In all probability the survey was never undertaken. Does it not smell of bias?

In agriculture too, about a quarter of the people who actually work in the fields are women. The 1971 Census records that of 47.5 million agricultural labourers 15.8 million were females. But it is a different story in the upper sections of agriculture, not engaged in actual work in the fields, but to a certain extent owning pieces of land and managing it are necessary. The number of men rises steeply from 31.7 million to 69 million and that of women falls to 9.3 million. Owning land is nearly the exclusive right of men. Recently (this year), when land grabbed from the Mahant at Bodhgaya was distributed, only after a fierce protest lodged by women activists of the Chhatra Yuva Sangharsh Vahini, the leaders of the struggle, and other women's groups, pieces of land were allotted to women also.

Even when it comes to toiling on land, women are specifically barred from certain tasks like hoeing. This has nothing to do with the much-publicised physical weakness of women. It is so that women may not contaminate what is "sacred". The other tasks that women perform in the villages are ample evidence that they are not treated as weaklings. After reaping stacks of grain with bent backs the whole day and walking long distances with heavy sheafs on their heads, they have to perform the additional task of house-keeping which includes such arduous jobs as carrying water over long distances, pounding and grinding grain, collecting firewood, making cowdung cakes, cleaning the house and coating the house and hearth with liquidised dung, dish washing, washing clothes at the pond. On top of all this, the children have to be looked after, elders have to be fussed over and the cattle have to be attended to. The normal day of a poor rural woman begins long before dawn and ends long past sunset. No weak person can perform such jobs.

The Equal Remuneration Act passed in 1976 and now in force is only to be seen where the wages are so low that no discrimination is possible. As the Labour Ministry itself admits, the small and scattered nature of land holdings makes the enforcement of the Act a formidable task. One would expect the agricultural worker's unions to atleast raise this economic issue in their movements. But apparently the issue has political undertones of fighting for equality of men and women which our frail unions can neither swallow nor digest. The BKMU carved out of the Kisan Sabha of the united CPI so as to overcome difficulties presented by uniting various classes under the aegis of the same union can be said to be the oldest union of agrarian workers owing allegiance to the Left. What have been its achievements?

To quote from its own report to the Fifth Nationl Conference 1981, under the heading 'Tasks of agricultural workers' movement, it says: 'The problems of women agricultural workers like maternity benefits, creches, proper resting places at work centres, payment of equal wages, etc., should be *highlighted* while agitating and struggling for wage increase' (emphasis added). The BKMU deems it sufficient to only highlight issues of such vital importance to women which also have the potential of shaking the very foundations of the social set-up.

Their achievements in other fields are beyond the scope and intent of this article, but their viewpoint regarding women labourers is amply reflected in their actions reported by themselves in their report. In Donepudi village, in Andhra Pradesh, and surrounding areas, BKMU succeeded in wresting an increase in the wages of men from Rs 5 to Rs 8 and women from Rs 3 to Rs 5, by striking work for three days. In Davegigudam village of the same State, agrarian workers under the BKMU umbrella together with the CPI-M-led union 'demanded wage at the rate of Rs 10 for men and Rs 8 for women and the landlords through negotiations agreed to pay at the rate of Rs 8 for men and Rs 6 for women'. Some achievement!

With their long history of struggle, plantation workers seem to be the only ones who raised the question of maternity benefits. Employment of women in plantations has seen a steady increase. In 1976 an average number of 416,000 women laboured on our tea, coffee and rubber plantations, which was 38 per cent of the total plantation workers. In just one year the percentage of female workers rose by 8 despite a general decline in plantation labour.

Only from this category comes the news that women claimed maternity benefits and got them. A total number of 42,991 women made claims and 41,791 got them. That only around ten per cent women had the pluck and support to stake claims is a reflection on the labour movement as such, still it does show willingness on the part of the unions to support such causes, although whether the women received all benefits accorded by law or not is not made clear.

Benefits is a word which allows wide-ranging interpretation. The Maternity Benefits Act provides six weeks leave before the date of actual delivery including it, and six weeks after the date of delivery excluding it. It would be pertinent to enquire whether enough medical advice is available to would-be mothers in remote rural areas to enable them to fix the date of confinement fairly approximately, to calculate the six preceding weeks long before the six-week period commences so as to allow enough time to stake the claim and fight it out and get it sanctioned so as to avoid running the risk of losing one's job. In all probability post-natal leave may be the only leave available to women.

In cases where no pre-natal and post-natal care services are provided by employers, the law prescribes Rs 25 as medical bonus. With the number of ill-equipped primary health centres in the rural areas it is anybody's guess how much the employer can provide to women with complicated childbirths calling for specialised attention. The *bonus* would not suffice to reach her to the nearest hospital, which may be miles away, in an emergency, and even after that there is no guarantee of care.

In order to effectively combat discrimination against women, it is essential for labour unions to go through a thorough soul searching exercise. It is true that being burdened with both housework and labour, women have neither the requisite time and energy, nor the inclination, to participate in collective struggles. The realisation that without collective efforts their conditions cannot be bettered and the lack of inclination to participate in the same forms an important contradiction among women. Despite this, a large number of women have come forward to raise the banner of struggle. In demonstrations one can see a generous sprinkling of women. Although their participation in the general labour movement is very low, it is not negligible.

If the labour movement sincerely desires women's participation it cannot be done only by wishing for it. To draw women into struggles the traditional relations between men and women have to be broken at the family level which the labour unions leave untouched in order to ensure that their membership and popular appeal are not disturbed. Without a radical change in their approach towards women no labour union can succeed in bringing about effective participation of women and hope to try solve their problems. Observing workers' days and bringing token representatives of women labourers to rallies and demonstrations by getting them a day's leave from drudgery may be a good populist stunt. It does not indicate an earnest approach towards women who form half the population.

Says the BKMU report that it had to delay its fifth conference for two years because 'all our attention had to be concentrated on the election battle in the next two months'. Since when has seizing a couple of more seats in parliament become the primary objective of the Left? That is what the legal Left is obsessed with, tossing coins to decide which section of the ruling classes to support. And the victory of the Janata Party in which kulaks and arch communal and reactionary forces had a dominant role resulted in the unleashing of a fierce offensive against the rural poor. 'Never before', says its General Secretary, Kodiyan, 'we had faced such a testing period as we did in 1977 and 1978'. 'Hundreds of Harijans were brutally murdered, *their* women raped, *their* houses and standing crops destroyed. All, houses, crops and women, are lumped together as *their*. After years of the founding of the CPI and its various fronts and its history one would think it is not in need of being reminded that class oppression (and caste too if you please) is not in quantified terms but in qualified ones; that whether a woman is raped once or twice is immaterial in historical terms, but the fact that a women *can* be raped is a significant symptom of a deeper malaise and that fighting to reduce the number of symptoms is not fighting the disease.☐

Inter-religious Couples: A Study

USHA BAMBAWALE and A. RAMANAMMA

INTER-RELIGIOUS marriage is a significant phenomenon in contemporary times. It has important implications in major institutional spheres of society, such as kinship and religion. Religion performs the positive function of maintaining social solidarity and social control. Parsons feels that religion is entwined with other elements in society in a complicated way, while at the same time people are influenced by the social groups of their origin. The social structure of a traditional society like that of India is decisively defined by religion, which is the ultimate ethos of its civilisation.

The central Hindu value-system — *purusharthas*, *dharma*, doctrine of *Karma*, and rebirth and the 'core' institutions of caste and extended kinship have crucially determined this ethos. Caste is the most important factor of social organisation in India. To ensure its continuity, society tightens marriage among people by endogamy and exogamy. Fundamentally the process of mate-selection functions like a market system and is governed by two norms — incest or avoidance rules and ethnocentric preferences. Consequently, the field of eligible partners is narrowed down considerably. In India the various religious groups follow strict religious endogamy and frown upon inter-religious marriages and try to prevent them. Though Christianity and Islam are proselytising religions, still their adherents prefer to marry within their religious fold.

Today winds of change are sweeping over the world. The values orienting social change in modern times are individualism, equality, liberty and secularism. The cumulative impact of these values, ideologies and beliefs finds its expression in two typical attitudes — romantic love and companionship. Science and technology, economic changes springing from industrialisation and urbanisation have contributed to the changed ideas and values of mate selection. This is significantly demonstrated in the slow but steady increase in mixed marriages. It is an expression of a major breakthrough in the value system of traditional India. Psychologically they pose some innermost problems of adjustment and reconciliation of the partners concerned. They have also an important socio-psychological dimension as they are related with a group phenomenon.

In this paper we attempt to study the pattern of adjustment amongst inter-married couples, who have been socialised in a home with different religious convictions. It is an accepted fact that all couples have to make some degree of adjustment, but Landis and Landis very emphatically declared that those who marry across religious lines have not only the secular but also the religious adjustment to make.

In this research the size of respondents' family, social status, social, cultural and educational background, and number of years of marriage are analysed. The study was restricted to the geographical area of Pune. The quota sampling method was adopted. Data were collected from 200 individuals by questionnaire.

The sample consisted of 50 Hindu, 26 Christian and 24 Muslim men and 37 Hindu, 45 Christian and 18 Muslim Women. The respondents belonged to 12 linguistic groups of India — Bengali, English, Gujarati, Hindi, Kannada, Konkani, Malayalam, Marathi, Sindhi, Tamil, Telugu and Urdu.

There are a few essentially secular adjustments that practically all couples have to make after marriage. Religion is irrelevant in these spheres and compatibility is based on inter-personal factors. A successful marriage depends upon agreement on basic values, affectional intimacy, accommodation, euphoria and certain other factors. Disagreement is more likely to arise between dissimilar persons, and marital problems amongst the heterogamously married reflect conflicts in the cultural background of the people concerned.

Only 28 per cent couples shared a common mother-tongue at the time of the wedding. Those who did not have a common mother-tongue chose to communicate in either Hindi or English. The bond of a common language eased interaction with parents and neighbours and this further contributed to reconciliation.

Other specific areas where adjustment was necessary were food habits, daily routine, social activities and monetary dealings. Though these habits are imbedded in one's personality, they are also inextricably connected with the cultural and religious background of the family. Adjustment in food habits assumes greater significance because it involves much more understanding between the partners. Approximately 15 per cent males and 16 per cent females were vegetarians. Vegetarianism and non-vegetarianism have some religious implications, being related to the creeds of violence and non-violence. The majority of the respondents were non-vegetarians and included a greater number of Christians and Muslims. There were 31 per cent males and 35 per cent females who differed in food habits from their spouses. Even after marriage vegetarians continued to maintain their particular food habits. In India not only does the pattern of cooking vary from caste to caste and from religion to religion, but even the metal of the cooking vessels differs in Hindu, Muslim and Christian homes.

Even in the secular areas of adjustments we clearly find overtones of the religious background. This clearly indicates how tangled religion is with day-to-day life-style. Most of the respondents, who had set up independent houses had achieved consi-

Dr Bambawala and Dr Ramanamma teach in the Department of Sociology, University of Poona. The latter is Reader in Sociology.

derable harmony in the matter of food habits. Only those respondents who stayed in joint families took a little longer to adjust.

A few couples had incompatible working patterns, due to the nature of their employment. Those couples who worked at the same place invariably went and returned from the place of work together. They invariably spent their leisure together. A sizeable number of women (44 per cent) worked to supplement their husband's income. A few (8 per cent) continued to work because of love of their profession.

Table 1: Distribution of respondents by difference in opinions in certain areas of life-style

Differences in opinion	*Male*		*Female*	
	Yes	*No*	*Yes*	*No*
Spending money	60	40	56	44
Daily worship	13	87	10	90
Rituals	7	93	10	90
Ceremonies	7	93	5	95
Other religious matters	15	85	18	82

A greater number of respondents (78 per cent) had adjusted to the timings of work and shared the chores at home. Of the 52 women who worked, 26 said that they were pressed for time and had to get up very early in the morning in order to complete their home tasks. They stressed that they had to make numerous adjustments to lead a fairly uncomplicated life. Kapur (1970) feels that wives had to make more adjustments in marriage than the husbands and whenever there are disagreements between husband and wife, the wife gives in 2-1/2 times more frequently than the husband. It was interesting to note that our respondents corroborated this view and testified that in general wives make greater adjustments after marriage than their husbands. American data are no different. Rurgess and Cottell (1939), Locke and Williamson (1958), Landis and Landis (1958) in their studies find a similar pattern. Thus adjustment by wives in marriage seems to be more or less a universal pattern. Most of the respondents said that they pooled their incomes to meet all needs, and financial matters were jointly handled. Those who lived in joint families contributed part of their salary to the family.

Though religious differences constitute the area of major confrontation, financial adjustment has assumed greater importance, because of the changing priorities of men and women.

Intensity of religious feeling played an important part in adjustment amongst the inter-religious married couples. Seventyfive per cent of male and 90 per cent female respondents believed marriage to be a sacred event, while 14 per cent men and 5 per cent women considered it a social bond and 11 per cent males and 5 per cent females considered it a convenient contract. This indicates that the majority of the respondents view marriage as being sacred, and this leads to conflict in adjustment.

A few men (18 per cent) and women (5 per cent) strongly resented their spouses following their own form of worship. Mild resentment was expressed by 46 per cent males and 55 per cent females; only 36 per cent men and 40 per cent women had absolutely no objection to their spouse's pattern of worship. Those who resented their spouses following their own religion felt that the children should not be unduly influenced by one parent.

Table 2: Form of worship in the household

Form of worship	*Type of worship*					
	Hindu		*Muslim*		*Christian*	
	Males	*Females*	*Males*	*Females*	*Males*	*Females*
Own religion	17	9	11	2	9	18
Spouses religion	8	15	3	11	3	11
Both	16	12	7	5	10	15
No worship	6	1	3	—	1	1
Not applicable						
Atheist	3	—	—	—	3	—
Total:	50	37	24	18	26	45

There is a clear indication that even after an inter-religious marriage a number of respondents showed a preference for their own form of religious worship in their homes. Objects of worship such as idols, pictures of deities or a sacred corner for worship of only one religion were in evidence in these houses. A few allowed their spouses the liberty of worship and some had compromised by allowing both forms of worship. Schnepp and Masatio (1955) point out that cooperation and adaptation are common among inter-married couples.

The practice of daily prayer was followed by 48 per cent men and 27 per cent women. Once a week prayers were said by 29 per cent men and 32 per cent women. These respondents went to the place of worship and participated in community prayers. A few prayed on special occasions such as Christmas, Easter, Ramzan or Diwali. Praying together is more a characteristic of Christians and Muslims as their worship is congregational. Among Hindus hymn singing or bhajans are congregational but in the long tradition of cultish worship, invariably an individual prays separately. Christian women emerged as the largest group that continues to relate religion with its own forms of prayer and worship.

In this study, we noticed that (1) there was no evidence of any meaningful or consistent mutual dialogue between husband and wife on each other's religion; (2) by and large there was no resistence to learn the prayers of the spouse with the exception of a few women, who were ardent followers of their original religion. In spite of their conversion they refused to learn the prayers of their new faith; (3) some women gave up their original way of worship at the insistence of their spouse. A few of these respondents had a genuine problem because (a) the husbands could not instruct them regarding the specific prayers, (b) the women were reluctant to learn a new set of prayers.

Reading of religious texts also forms part of

(*Continued on page 33*)

Press Commission Report

Discussion on the Report of the Second Press Commission — which is yet to be officially published — began in these columns (*Mainstream*, April 17, 1982) with a contribution from G.N. Acharya. Last week we published two articles, by S. Viswam and A. Raghavan (*Mainstream*, April 24). This week we publish a contribution from R.C. Dutt, former Secretary, Government of India, and now Honorary Adviser, Standing Committee of Public Enterprises. Further contributions on other aspects will appear in subsequent issues. —*Editor*

Dominance of Business Interest

R.C. DUTT

THE Press Commission has submitted its report, and partial summaries have appeared in newspapers all over the country. The report itself is still a secret and will be treated as such until it is placed before the two Houses of Parliament. This is, of course, understandable, but there is an equally understandable impatience among those interested in the contents of the report which will not permit slow governmental processes to deny discussion of the report when it has already attracted public attention, and thus gradually kill it by lack of interest.

This impatience is born out of the fact that the stakes are high, and the policies at issue have been debated upon for years. It is true that the printed word carried by the press reaches fewer people in the country than the spoken word broadcast by Television and the Radio. But the press has an advantage not reflected by the number of its readers. The written word not only lingers and can be referred to over and over again when the spoken word has been forgotten, but perhaps, more importantly, the press which carries the written word has the potential of being used by a larger variety of persons belonging to different economic strata of society than the capital-intensive audio-visual media which can be owned either by the state or at best by some different groups of persons. Should this potential be exploited for the benefit of a democratic society, or should it be allowed to be lost by creating monopolist or oligopolist conditions in which only the points of view of the monopolists or oligopolists find expression? This is the crux of the debate which is going on for more than a decade now.

With this debate as to how to make the press media equally accessible to persons holding different points of view and belonging to different social classes is entwined another, which relates to the relations of the press with the state, To what extent should the press be controlled by the state in the matter of expression of opinions?

This is an important questions too, for unless the state allows the press to express diverse, and even conflicting, points of view, there can be no freedom for anyone except the group or party in authority. But this does not exhaust the content of the concept of freedom of the press, as is often made out by the "liberal" school of thought. What good is the absence of state control if the material conditions are such that only certain points of view can find expression?

Comparisons are often odious, as the saying goes, and it is futile to debate which aspect of press freedom is more important than the other, freedom from state control, or assurance of conditions in which various points of view can find adequate expression. Both are equally important, for one is meaningless without the other, though traditionally it is the former that has received much greater attention than the latter from the votaries of press freedom. This has been so because the battle for freedom of the press has been fought mainly between the press, as it has existed from time to time, and the state that has sought to control it. And it is a continuing battle, for the state, which has the undoubted right to curb certain subversive forms of expression, is often tempted to exceed the limit and forbid expression of views inconvenient to it. Thus, while no state can allow incitement to violence to overthrow it, or permit spread of disaffection among various sections of its population on social or religious grounds, and is therefore entitled to take action against those who do so, it often prefers to suppress all forms of dissent even by such pre-emptive action as pre-censorship of news and views.

This battle against over-stepping the limits of control must be fought, but in doing so it should not be overlooked that there is another battle, also worth fighting, between the established press and those who struggle for expression but are excluded from the establishment. This is a struggle which is equally important, but far less articulate as it has to be fought on behalf of those who have still to find their voice.

It is true that eternal vigilance is the price of liberty, and it is right, therefore, though there is general agreement in our country on this subject, and freedom of expression is protected by the Constitution, that we should be vigilant against any encroachment on this freedom. That there was such an encroachment during Emergency is a fact of history which cannot be obscured by refusal to discuss it or even refer to it. It makes little difference if this encroachment was in accordance with law. If it was, it needs to be discussed if the law requires to be amended to prevent such encroachment in future.

A point for discussion, on the other hand, may well be whether conditions preceding imposition of pre-censorship as a part of Emergency administration justified this step. The veteran journalist, G.N. Acharya who in his article (*Mainstream*, April 17, 1981) has pleaded guilty to having welcomed Emergency, at least for the first six months, as a necessary evil, was not the only one to have done so. Many others at the time welcomed Emergency, including censorship of news, though, it is now generally recognised, erroneously.

These are, however, matters of debate, and the majority members of the Press Commission have not gained in stature by refusing to discuss the matter, as they are reported to have done. By their refusal they have merely succeeded in placing the mantle of champions of press freedom on the four dissenters.

But whose freedom do the dissenters champion? It is perhaps not entirely fair to criticise the dissenters without perusing their lines of reasoning, to condemn them unheard, so to say. No line of reasoning can, however, obscure the facts (i) that the press as it exists in India is dominated by big business interests, and (ii) that this domination creates conditions in which it is extremely difficult for independent journalists without business links to venture in the field in order to make their points of view heard. If these facts are accepted, and it is difficult to deny them, they naturally result in the big-business point of view finding disproportionate expression in the press. In these circumstances, absence of governmental control, however laudable an objective by itself, can only mean, unless other corrective measures are also taken, freedom of big business interests to continue unhampered to express their points of view in the national press disproportionately to their numbers.

To many champions of press freedom, absence of Government interference or control is its sole content. Not only that; they extend the case for Government non-interference with the press to non-interference with the present structure of the press also, on the ground that all parties, including big business, have the right to express themselves freely. This is unsound logic, to say the least. Government non-interference is the means, not the end, the end being that all should have equal opportunity to express themselves. A structure which hampers this equal opportunity is not conducive to freedom of the press, for continuance of that structure can mean freedom only for a few. Nor can re-structuring of the press amount to interfering with the freedom of expression of any individual or group. Big business men as individuals have as much right to express themselves as humbler folk. This right is not sought to be curtailed. What is sought to be curtailed is the deployment of resources which they possess, but others do not have, to derive undue advantage over the latter in expressing their point of view.

These resources are tremendous and can make a substantial difference to the viability of any newspaper or chain of newspapers in whose support they are employed. The capital derived from business sources, the ability to suffer losses during the initial period and the capacity to undercut competitors not similarly placed, are, by any standard significant advantages which such parties enjoy. To this has to be added the considerable advantages which business groups derive in the matter of advertisements which originate very largely in the business world. With these advantages, it is hardly surprising that big business has a stranglehold on the national press, not merely by direct participation in the newspaper business, but in almost equal measure from advertisement policies. The latter is of crucial importance, though it is often lost sight of, or at least is seldom emphasised. There have been representations to Press Councils and other authorities against Government discriminating in favour of or against newspapers to encourage or punish expression of certain views by extending or withholding advertisements from the newspapers. That this possibility exists, and that in fact advertisements have from time to time been used by Governments for this purpose, need not be denied. Little is, however, heard of the use of this same weapon by business interests in the growing consumer society that is developing in our country. And yet, this is certainly happening. Indeed, this is an instrument which enables big business houses to dominate the press.

What are the consequences of such domination? Its main consequence has been to stifle national debate, thwart the forces of change and encourage development on capitalist lines. The great national debate initiated before Independence, and pursued vigorously for a decade and a half after Independence, was for secularism, socialism and non-alignment. Each of these concepts has its own content, but they all postulate a change of production relations which would ensure social good rather than profit maximisation as the motive force of production, and self-reliance rather than dependent development as the objective. This basic postulate of a change of production relations, however, hurts the capitalist interests which are not reluctant even to enter into dependent relations if it maximises their profits. This conflict of interests, if it is to be debated objectively, needs equal facility and freedom of expression, but while the latter exists in a formal sense the former is stifled by a press dominated by one of the contestants.

The result is that while the case for change has been presented by a few periodicals with limited circulation among academics and others interested in change, the dominant voice of the Press is against any such change. Adherence to principles of change has been denounced as doctrinaire and ideological rigidity, while acceptance of *status quo* has been extolled as pragmatism. The public sector, the only concrete instrument of change, has been discredited as inefficient and bureaucratic, ignoring the fact that much of the inefficiency that may have crept into it has arisen out of the fact that its social role has been overlooked in pursuance of a role which at best is supplementary and at worst subservient to the private sector.

The fact is that with a Press dominated by vested interests of a particular class, it is the outlook of that class that is being drilled into the minds of the educated sections of our population. And yet, it is to this section of the population, the bureaucracy in Government, the executives in the public and even the private sector, the professionals, the journalists and others similarly placed, that one has to look for creating a general consciousness in the country for change, which cannot be brought about by a few academics and "intellectuals" alone who have interest in and time and patience for studying objectively the other side of the case. If, therefore, the process of peaceful change is to have a fair chance and is not overtaken by the growing contradictions between promise and performance, between affluence and poverty, and if the ideals not only of socialism but of secularism and non-alignment are to be cherished, for they are all in danger, the first pre-requisite is that there should be real freedom of the press, so that all points of view have equal opportunity and not merely equal formal right to express themselves.

The danger is real as our recent history shows. The socialist fervour of the fifties and early sixties, temporarily revived in the late sixties and early seventies, has disappeared. The word "socialist", having been enshrined in our Constitution to describe the nature of our republic, has all but retreated from general use. It is still to be found in so-called Leftist journals, but is taboo in "respectable" decision-making bodies. "Garibi Hatao" has left behind no echo, even as a slogan, and growth of GNP with or without social justice has been adopted as the objective. With the retreat of socialism, sectional and group points of view, including communal, chauvinistic ones, have emerged and even rationalism is at a discount to the danger of secularism. Non-alignment was eclipsed by "genuine non-alignment" during the Janata regime, and though it has been rescued since, it is difficult to say how long it will survive the increasing dependence on the World Bank, the IMF and the Western multinationals.

All credit to the majority of the Press Commission who, if the press reports are correct, have presumably recognised the danger inherent in an unbalanced press. Their lapse in refusing to debate Emergency censorship will no doubt be magnified by the dissenters and persons of their way of thinking, but should not blind us to the fact that they have emerged as better protagonists of press freedom than the dissenters. Emergency censorship, highly retrograde as it was, has now passed into history, and those who promulgated it were duly punished in the historical process by temporary loss of power, which could have been of longer duration, if not permanent, but for certain accidents of history. The Press Commission should have utilised its opportunity and its resources for an authoritative analysis of the phenomenon and its consequences, not to censure any individual or group of individuals, but to draw lessons for the future. This opportunity to benefit by past experience was lost by the Commission, but it has not been lost to history. History will draw its own inferences.

What is much more relevant for a Commission, set up to advise on policy matters, is how the policy should be framed which will affect the future. For the future, apart from continued vigilance to avoid aberrations like Emergency censorship, nothing is more important than (i) delinking business interests from the Press, and (ii) preventing advertising power of business from distorting newspapers' policies. Government made tentative beginnings in both these directions and the present writer was associated with the former. It failed because of the hostility of the business press which the Government was unwilling to face. The latter, which was formalised in a price-page schedule, was struck down by the courts and was never revived.

A fresh beginning will have to be made in both these cases, and if the Press Commission has provided the base for such a beginning, it has amply justified itself. It is now for all those who believe in freedom of the press, specially for organisations of working journalists, to create a strong enough public opinion to ensure that the Government does not hesitate or falter again. □

(*April 21*)

MAN WITH 'NO DRIVE'

Not long ago I mentioned the vagaries of language and the quaint meanings that different societies invest in the same words, citing as an example the all too frequent Indian use of "backside" to mean the rear of a building. Now a reader says that the best "loafer" in town is not a vagabond or layabout, but an industrious baker who prides himself on his hot loaves of bread. It is also rather embarrassing to find that if one says "gay" nowadays to mean lightly festive, one is apt to be misunderstood for the word is the widely accepted euphemism for something very different. Happily, this meaning has not spread very widely in India, but we have imbibed, alas, two Americanisms that would make any Presidency College purist of the old days shudder. One is "prestigious" as a complimentary adjective when in orthodox English the word means "practising juggling or legerdemain; cheating; deceptive; illusory" and is, therefore, far from flattering. The other is the common use of "transportation" for transport though there was a time within memory when "transportation" meant only penal banishment to the Andamans. This sense still persists in the Indian Penal Code but not in everyday usage.

But the story I like best is of the Writer's Buildings official who gave a glowing confidential report to his assistant, saying the man was honest, hard-working, enterprising and dependent "but no drive". Naturally, the assistant failed to cross the ability bar. The following year too his boss reported that he was sincere, trustworthy, innovative, diligent and capable "but no drive", and again he was refused promotion. After this happened a third time, the frustrated man went to his superior to ask respectfully in what matter he had not shown drive and if he had not how he could have all the other virtues he was credited with. The senior officer explained that all the fulsome tributes were fully merited. "But you still can't drive and I have been telling you to get a licence".

From A Ditcher's Diary, **Capital**, *April 19, 1982.*

Burma: Success Brings Problems

ECONOMIC problem No. 1 for Burma until the mid-seventies was how to manage any growth at all. In 1971, the socialist leadership actually chalked down a 1 per cent on its economic growth chart. In recent years, however, the economy has been expanding by an average 6 per cent annually, last year by an impressive 8.3 per cent (compared with Thailand's 6.3 per cent, Bangladesh's 4.8 per cent). Resource-rich Burma is now confronting a decidedly novel dilemma: how to keep pace with its own mush-rooming success. The main problem is finding and harnessing what the country is believed to have plenty of underground — energy.

Burma's economic turnaround has been fuelled mainly by massive injections of concessional loan aid as well as direct grant aid. But more important has been a striking improvement in agricultural performance spearheaded by a spectacularly successful high-yield-variety rice programme that has boosted both production and exports. Across the board, growth in the agricultural sector last year was an unprecedented 14.6 per cent. Other key oil-dependent sectors have also been on the move in a big way. Manufacturing last year grew at over 11 per cent; transport and communications at nearly 9 per cent.

The catch is how to keep the wheels of agriculture, industry and transport turning. Domestic oil production has been rising but not fast enough. In 1975 when Burma stopped importing crude, domestic output stood at 6.5m. barrels. By 1978 it was over 10m. barrels and economic planners began looking at export markets: in 1979 Rangoon agreed to provide Japan with 1m. barrels of crude.

But the crunch came during the 1980-1981 financial year. Not only did production not exceed the previous year's record figure of nearly 11m. barrels — it actually dropped. As the state-owned Myanma Oil Corporation (MOC) told it, the drop was around 5 per cent, but diplomatic analysts reckoned it could have been as much as 10 per cent lower than the official output figure of 10.35m. barrels.

Flagging output has meant not only a failure to meet export commitments, but shortages on the domestic market of all three leading refined fuels — kerosene, gasoline, and, most disruptively, industrial diesel oil. The government has responded by sharply cutting back on kerosene production with a view to concentrating on the other two. In a country where most urban households depend on kerosene for cooking the political impact has been predictable.

The diesel oil shortage has had the most damaging impact on the economy. "The agricultural sector has been especially hard hit", noted one analyst. Several major infrastructural projects have been slowed or halted altogether, say Rangoon sources. And in many areas irrigation potential has been limited by lack of diesel to drive pumps.

Just how crude output is likely to fare this year remains unclear. But pundits in the capital have not been slow to draw their own conclusions from the fact the government has stopped publishing monthly production figures — "a fair indicator", as one put it, "that things aren't as well as they might be". Unofficial sources indicated that MOC's production target for this financial year is around 14m. barrels — a figure that would require a daily output of about 38,000 barrels. But informed sources estimate real production at present may be little more than around 22,000 barrels daily.

The key to the dilemma hinges on new finds, and there at least optimism appears warranted. Last November, three new onshore oil fields were announced with much fanfare ...... So far, though, Rangoon observers note that the claims from the new fields have been conspicuously more impressive than actual production. Only one, at Htantabin in the Delta, is actually producing — at an estimated rate of between 1,000 and 1,500 bpd.

While onshore exploration continues apace, it's on offshore potential that immediate hopes are pinned. In February, agreement was reached between Rangoon and a Japanese consortium that will put up US $ 16.8m. for exploration in the Gulf of Martaban off Rangoon. Interestingly, the Gulf area was one place Western oil companies were not invited to prospect during their abortive drilling in Burmese waters between 1976 and 1978.

But even assuming offshore finds are struck in commercial quantities, bridging the energy gap is not going to happen overnight, say observers. For one thing, MOC lacks technical expertise for offshore drilling and according to one analyst "will need some... assistance for the project." In addition, finding drilling rigs could slow things up: no Japanese rigs are at present available and Rangoon appears reluctant to turn to the Americans.

Whichever outsiders join the venture, though, it seems unlikely there'll be oil on line for a few years yet. Meantime, short of some big onshore surprises or a major change in import policy, the energy gap will continue to put an unwelcome but unavoidable break on the country's headlong economic acceleration. But then, it is a measure of Burma's progress that it is facing such a problem.

Sikh Way of Life

LT. COL. MANOHAR SINGH (Retd)

A way of life emerges from the mission one has adopted. The Sikh mission governs the Sikh way of life. One has to go back to the Sikh of Guru Nanak's time and see how he has been shaped to understand society as it matured in the form of the Khalsa in the time of Guru Gobind Singh. The Khalsa is a universal brotherhood. It voices the concept of one world — *manas ki zat sabhe ek pehchan bo* (mankind is one). Also, the Creator (God) is one whose existence is not affected by time and who does not participate in the chain of birth and death. He is immortal.

The living Guru hierarchy ended and Sri Guru Granth Sahib (Adi Granth) was installed in perpetuity as the future Guru under the commandment of Guru Gobind Singh, the last and tenth Guru. The body is prone to death, but the Word lives on for ever. The commandment runs as under and is sung after *Ardas* (prayer) by the congregation on every occasion:

> *The will of God hath ordained the order of the Khalsa.*
> *This is the final Commandment to all the Sikhs;*
> *Accept Granth as the Guru.*
> *Deem the revered Guru Granth as the visible*
> *Body of all the Gurus.*
> *He who hath disciplined his soul, shall behold*
> *Confirmation there in the Revelation itself:*
> *The Khalsa shall rule and none shall successfully defy them.*

Sikhism does not believe in idol worship and has rejected the worship of gods and goddesses, since the gods are said to die when Brahman dissolves His creation. Therefore, Gurus' statutes or pictures are not displayed in gurdwaras.

Sikhism totally believes in *Grasth Ashram* (householders' life) and aims at obtaining *Mukti* (salvation) by people leading a normal or even an aristocratic life but remaining unattached to worldly things. This is evident from the lives of the ten Gurus. Abandoning society and retiring to caves and jungles to punish the body for one's spiritual development or neglecting the spirit for one's physical health is not the Sikh credo. The pleasure of normal life one must enjoy, but at the same time one must avoid the evils of gluttony or excess sleep in order to keep body and mind active and alert. This is necessary for the Sikh to live as a saint or as a soldier, as occasion demands.

Sikh life is based on the three basic principles of *Namjapna* (reciting Thy name), *Kirt Karna* (living by honest and hard work) and *Vand Chhakna* (sharing of wealth and power). The Sikh follows the motto of *Deg Teg Fathe* (*Deg* representing food or pot of food, *Teg* the sword and *Fathe* success or victory). To achieve success in any field of life, one must excel in wielding the sword to protect one's wealth. *Deg* and *Teg* are complementary for victory or success in leading a prosperous and dignified life. Napoleon's declaration that an army marches on its stomach, comes close to this concept. Vinoba Bhave said after the 1962 border war with China that a poor man cannot fight for his country.

In the Sikh way of life, the *Miri* (temporal) and the *Piri* (spiritual) — politics and religion — have been merged. Hence politics rests on religion and viceversa. The sword of *Miri* was to be wielded only against cruelty and oppression and to protect fundamental freedoms without oneself coveting political power or a realm on earth. Both *Bhakti* and *Shakti* (wisdom and power) are part of the Sikh way of life. *Bina raj nah dharam chale hai* (without the help of state, religion cannot be effective). As Guru Hargobind said, a religious philosophy or culture that cannot defend itself when cruel and savage forces attack it is bound to perish unless the evil is fought with its own weapons.

The daily assembly and congregation — *Ardas*, *Sangat* (devotees) and *Pangat* (lyric) — are the special features of the Khalsa Panth. The Sikhs were ordained to assemble daily before the Guru to have religious discourses and receive his orders regardless of the weather or other obstacles created by mountains and the sea. Since the institution of the Gurus has been perpetuated for eternity in Sri Guru Granth Sahib, the holy book is dressed in brocades or other silken material to denote royalty and is placed on a throne with an attendant with a *chawri* (yak tail).

The room in which the book is kept is called Darbar Sahib (court room). A devotee is to present a *Nazar* (donation) to the Guru Granth Sahib to denote its sovereignty. *Ardas* is not found in other religions. Since there is no institution of priests, *Ardas* can be read by a member of either sex in the congregation, irrespective of his or her special status. *Ardas* starts with expressing faith in the formless form of, and abiding victory of, God and then invokes the divine spirit of God. He prays for those who have shared their property, worked for society's welfare and lifted the sword for the protection of the weak and the discarded. Prayer is also invoked for those men and women and children who allowed themselves to be sawed, scalped, dismembered, turned on wheels, boiled or burnt alive by hanging from trees, and the mothers who embraced the garlands of their children's flesh, but did not waver in their faith nor compromised their principles and maintained the sanctity of their last hair till their last breath. They beg not for worldly gifts but for such things as *Nam*. The closing stanza, which is the base of Sikhism, says: *Nanak nam chad di Kala Tere bhane sarbat da bhala.* (In the name of Guru Nanak, O Lord! grant us remembrances of Thy name and the morale to

(*Continued on page 34*)

Arms Race *(Continued from page 6)*

military exercise and the 1971 liberation of Bangladesh, ignoring for the time being the intrusion in Kashmir, would clearly indicate that much to our dislike we are forced to divert our scarce resources to unproductive military budget. Moorthy in his book *Arms Race and Its Consequences*, has vividly brought out this aspect:

> "The wastefulness of the arms race is colossal. The amount allocated for the designing and development of the US Air Force fighter F-16 (which carried out the bombarding of Iraq's nuclear installations against all laws of international behaviour, and which were promised to Pakistan recently) would have been enough to finance eight major programmes similar to the World Health Organisation programme to stamp out smallpox in the world. The cost of one Trident submarine would finance the schooling of 16 million children in developing countries for a year. One modern tank costs 500,000 dollars, which is equal to the cost of equipping 520 class-rooms. The building of one modern destroyer costs 100 million dollars which is enough to bring electricity to towns and rural areas with a population of nine million people.
>
> The cost of the development and manufacture of the new Tornado plane of Britain is about 7,000 million pounds. This is more than what Britain spent on health and social security in the 1976-77 fiscal year!
>
> According to West German experts, the amount required for the manufacture of one Leopard-2 tank would be enough to build 36 three-room flats. One military exercise of a tank battalion costs as much as the building of 28 kindergartens. It would take 450 million dollars to eradicate malaria, which is less than half the annual cost of the arms race to mankind."

Human rights can be divided into political human rights and economic human rights. My concern is with economic human rights. Do we want more schools, jobs, places for enjoyment of leisure, libraries? Though there is no scientific survey available, if these industries devoted to manufacture of arms are switched on to the production of consumer goods, the destitution and starvation in Third World countries can be practically eliminated.

Today arms race is proceeding at top speed and the attempt, therefore, for reduction of strategic arms and detente are welcome steps. Certain events have put the clock of history back. But it is time that peace-loving people so raise their voice and start an international movement as to bring pressure upon the leaders of the world to return to the negotiating table, to detente peaceful progress and co-existence.

Even a super-power like the United States in search of illusory military superiority undertook a vast increase in the military budget. What are the consequences? A number of welfare services are being starved, a number of social services have been cut down, and the belief that increased spending on armaments would arrest the upward curve in unemployment is wholly belied. The net result of this unimaginative policy has been destabilisation in Asia, Africa, Caribbean and South America. Unemployment has not gone down in the USA.

The compelling necessity for the Third World countries to buy arms in the circumstances I have just explained has further impeded their onward march towards an egalitarian society. According to the figures recently published, Third World countries buy arms worth 13.5 billion dollars from the European Economic Community, 15 billion dollars from the USA and 16 billion dollars from the USSR. This led the *Indian Express* correspondent in America to state that arms and arms-related industry will be practically the only industry to thrive under the present American administration. But the arms purchased by the Third World also become counter-productive. The Shah of Iran got the most modern arms and that proved his undoing. Pakistan in the Asian sub-continent and Israel in the Middle East are two countries which have pushed up arms sales to Third World countries because of brinkmanship and made it a compelling necessity for the Third World countries to purchase arms.

There is another aspect which needs to be examined in the context of arms supply. After India achieved Independence a wind of change blew all over the world, especially the African continent. National liberation movements started in various dependencies. The empire-builders tried to halt the march by use of arms. The very economic prosperity of the holding countries was threatened if the colonies were liberated because the colonies provided a cheap supply of labour for raw materials and a dumping ground for finished products. Slowly and assuredly colonies after colonies were liberated. There of course remained some reactionary, retrograde imperial outposts such as South Africa. By itself it may have a nuisance value but the white racist regime in South Africa so formulated its foreign policy that today the question of Namibia is engaging the attention of the whole world. While colonies were liberated, the economic stranglehold was not easy to loosen. As a result the poorer section of the liberated colonies yearned for socialist change over. But the feudal overlords, as is now demonstrably established in El Salvador, wanted to keep their stranglehold on the masses for perpetuating their exploitation. As the economic liberation movement grew stronger and fiercer there was a new outlet for suppliers of arms to the anti-people regimes in these countries. El Salvador demonstrates the point.

The entire economy of the Western world is dependent upon oil prices. When the knowledge dawned on the oil-producing countries that the Western powers were exploiting the natural resources and since the early seventies the oil prices started rising, the Middle East became a sensitive area. Today the most sophisticated and costly arms are being supplied to Middle East countries. A large part of the earnings of petro-dollars are being spent on buying sophisticated weapons.

It is true that the USSR is supplying arms but this must be understood in the context of the geo-political situation. Friendship with all being the goal of Indian foreign policy in early fifties, we hardly spent anything worthwhile on arms. China and Pakistan instigated by the western powers imported arms much beyond their domestic requirements. India was forced to buy arms and obviously it had to turn to the USSR. That is equally true of Ethiopia, Angola and Mozambique. The fact is that while in one case arms are being supplied for destablisation, in the other case arms have to be purchased for survival. And that is the dilemma. □

Inter-religious Couples (*from page 26*)

worship; specially in monolithic religious orders, it is an important and essential part of veneration.

Table 3: Reading of religious texts

Religious texts	*Males*		*Females*	
	Yes	*No*	*Yes*	*No*
Gita	12	88	10	90
Bible	21	79	41	59
Koran	7	96	7	93
Any other	10	90	10	90

Unlike Hinduism, Christianity has only one universal sacred book and the habit of reading is cultivated from an early age. So we find more Christian women and men read the Bible.

A marginal number attend religious discourses (7 per cent males and 5 per cent females). The men attended these discourses with their spouses.

Festivals and ceremonies, *pujas* and *vratas* are all important occasions which have special significance in each religion. Women respondents celebrated many more festivals than the men, chiefly because some of them were accompanied by a *vrata* exclusively observed by women. The Hindu calendar abounds with religious occasions and a few Hindu women went to their natal home for Holi, Ganapati Puja, Raksha Bandhan, Vata Savitri Puja, Hartalika, Karva Chouth and Ugadi. Some of the important *vratas* connected with belief in securing a good husband and a long life for him were very popular even among the inter- married. Even after an inter-religious marriage the respondents adhered to a religious pattern of worship. *Pujas* still have a meaningful place in the life of the Hindus and those who have Hindu spouses. One of the reasons for the continuance of these *pujas* among the inter-married was their residence pattern within a joint family. Tolerance and respect for the partner's religious practices are also a part of adjustment. Even inter-religious married Hindus perform the popular Satyanarayana puja.

Ganesh occupies the prime place in any ceremony. At the beginning of every puja or ceremony, Ganesh's blessings are invoked for protection of hearth and home from evil. Four per cent Christian and an equal number of Muslim men have adopted Ganesh Puja after their marriage to Hindu spouses. Hindus celebrate Navratri throughout India by visiting temples of Durga, Kali, Jagdamba. Inter-religious marriage had made no difference to some women who continue to celebrate this festival.

The men and women adjust to a great extent in matters where religious practice is involved. It also brings to light a salient fact that religious socialisation or orientation is deep-rooted and persists even after a number of years of marriage with a person of another religion.

Another important area of adjustment is the concept of purity and pollution. In Hinduism this basic idea manifests in various ways from caste to caste, and is distinctly different from the notions of the sacred. The 'touchable' and the 'untouchable' are determined by the Brahiminic code and extend to the concept of pollution as is viewed by Muslims. A pig is considered unclean by Muslims and anything connected with pig flesh is considered polluted. The Hindu concept of purity and pollution is applicable to daily habits as well as to widow remarriage. In Hindu households the code of cooking is also enmeshed with the idea of purity and pollution. The majority of the respondents (82 per cent men and 80 per cent women) subscribed to the Hindu spouses concept of purity and pollution. The Christians and Muslims naturally did not understand its significance. Most of the Hindu respondents confirmed that after rubbing shoulders with all sorts in the city, the very concept of pollution had weakened considerably; it was further weakened by inter-religious marriage and was practically extinct in some homes.

Adjustments between partners is of greatest importance in any marriage. Among the inter-religiously married it is vital as the couple is conscious of their differences.

From the analysis of the two areas — religious and secular — that are involved in adjustment, we can conclude that the ways of adjustment fall into three different patterns:

(i) Some couples develop a relationship in which both compromise to a certain extent and find a middle ground of agreement that is satisfactory to both, achieving some degree of adjustment, security and confidence in inter-marriage after a few years (for example, language, food, festivals, etc.).

(ii) In the second type of adjustment, they accept their differences and accommodate in one or several ways. In the area of non-religious matters —

(*a*) The couples adopted a convenient common language and solved the problem of verbal communication. Hindi or English was chosen by most of them.

(*b*) Problem of divergent food habits was solved by mutual consent in different ways.

(*c*) The husband and wife had worked out a compatible work schedule in their daily routine.

(*d*) The maximum difference of opinion was regarding financial adjustment.

Very few couples were above the concept of religious identity which was further heightened by the dimension of culture. In spite of inter-religious marriage a large number of respondents were religious-minded. The religious manifestation is not always overt and direct, specially as the partners believed in worship and prayer, and each maintained a sacred corner for worship and celebrated festivals of his/her religion. A sizable number of these couples also performed *pujas*, visited temples, churches, mosques, according to their faith.

Those rooted in religious heritage objected to the loyalty of the spouse to his/her original religion. Christian women were found to be the rigidest. The idea of purity and pollution was beyond the comprehension of Christians and Muslims. To the Hindus it was still meaningful in some ways. Yet, there appears to be near-perfect understanding between a few couples who pursued their own respective religions. There is no substantive evidence of tension due to religious differences.☐

Indian Development *(from page 8)*

interests run counter to the Left's own, namely, the working class and the toiling peasantry.

Proposition 7 makes explicit the fear which the Left has often implied but never clearly analysed. This refers to their general fear of the foreign multinationals taking over the Indian economy in alliance with indigenous monopolist-capitalists, threatening India's freedom and sovereignty. This fear is based on the classical model of Western capitalist evolution towards imperialism experienced by developing countries over the last two centuries. But there is no historical inevitability about this pattern of capitalist evolution repeating itself in India also in the same way as in some other developing countries. India has already developed at least some countervailing forces which can help in checking this pattern of economic evolution at an early stage, particularly since such an evolution would call for an end to democracy and elections which the Indian masses would not put up with.

In view of these considerations, it would appear that the Left needs to very carefully consider its policy positions and compare and contrast them with those of Indira Gandhi and her Government. On points where there is convergence of interests and perceptions, the Left should be flexible enough to support Indira Gandhi and cooperate with her in the formulation and implementation of such convergent policies. But on points in which the basic class nature of Indira Gandhi's policies and her Government come into conflict with the interests and welfare of the working people of India, which are the Left's main pressure groups, the Left has no option but to mobilise the masses against these policies and lead the struggles of the working people against the vasted class interests of their exploiters and oppressors.

Sikh Way of Life *(from page 31)*

accomplish what is Thy will, and the good of the entire humanity). Faith in and devotion to this *Hukam* (order) makes a Sikh acceptance in any progressive society anywhere.

This daily prayer is thus a model of the Sikh way of life. After *Ardas*, a hymn is read from Guru Granth Sahib called *Hukam* or *Hukam Nama*. And a resolution passed by the holy congregation for the welfare of the community is called *Gurmatta*. Originally *Gurmattas* were issued by Guru Hargobind from Akal Takhat Sahib. Before the congregation disperses, Karha Parsad is distributed on all occasions, whether of rejoicing or grief. The Sikh believes in the will of God and *chadi di kala* (high morale) does not permit depression to set in.

The *Sangat* and *Pangat* principle upholds the principle of equality in the daily life of a Sikh. In the *Langar*, free food is served without any consideration of caste, creed, religion or sex. A Sikh takes great pride in cleaning dirty utensils and the floor, grinding flour and serving water and fanning the *Sad Sangat* (congregation). Even Emperor Akbar had to partake of food before he could have an audience with Guru Amar Das.

The Sikh marriage, Anand Karaj, has much grace and simplicity. It is not bound to an hour, though early morning marriages are preferred, if otherwise convenient. Guru Hargobind married his daughter late in the evening at village Jabal after having fought an unexpected battle at Loligar Port. The four stanzas, initially written to describe a seeker's union with God, are now sung as the bride and groom go round the Granth Sahib four times to solemnise the wedding, and these hymns guide the couple. The groom is enjoined to treat all other women as mothers and sisters and the bride to treat all other men as brothers. The man takes the oath before Sri Guru Granth Sahib with a sword in his hand to protect the life and honour of his wife. The couple take vows of loyalty in direct communion with the Guru, so to speak, not before a priest.

The Sikh flag with a *Khanda* (double-edged weapon) is *Nishan Sahib*. The *Nishan* is sign of [illegible] aim at as a point of direction. The *Nishan Sahib* is the sign of sovereignty of the Khalsa Panth. It represents *Bhakti* and *Shakti*. It is hoisted on all religious and educational institutions and on the vehicle carrying Sri Guru Granth Sahib.

A sip from the *Amrit* (nectar) bowl magically chases away any feeling of caste, injecting the spirit of bravery and courage. The administration of *Amrit* in Sikhism has been in vogue since Guru Nanak's time. It was then called *Paul Amrit* (amrit made by the touch of the Guru's feet). Guru Gobind Singh changed it from *Paul Amrit* to *Khande Ka Amrit*. Therefore, baptism by the double-edged sword — the disintegrator — was in the nature of a modification of, and not innovation in, the accepted forms and usages practised by the Sikhs and ordained by the previous Gurus. The other injunctions regarding abstinence from tobacco, intoxicants, and shaving and trimming of hair, and adultery, were merely reiterated with an emphasis on their strict observance.

From the very beginning, Guru Nanak and all the other Gurus gave clear indications that the type of man and society they were aiming at must bear unshorn hair, the veritable symbol and testament of spiritual integrity. Guru Gobind Singh at the time of baptising the five beloved ones ordered the Sikhs to observe the Five Ks (*kachha, kara, kirpan, kanga* and *kesh*) and in future always present themselves to him accordingly. He gave the Sikhs that which entitled them to be called *Khalsa Akal Parkh Ki Fang* (army of God). He made the *Sad Sangat* supreme by declaring that Gurus' power measured 20 units and the *Sad Sangat's* 21 units. A Sikh should neither dominate anyone nor accept anyone's domination. It was through this Khande Ka Amrit that the spirit of the lion was infused in Sikhs and gave them the appellation Singh (lion). The oppressed became lions.

Baptism is an absolutely voluntary act and one has to qualify to be able to receive it. One has to be able to live up to the Commandment of the Guru. The status of the Five Pyres and the democratic form of life are institutionalised when he begged of them *Amrit*. This is a unique example of a relationship between Guru and followers, a true example of secular, democratic and religious life.

Any Sikh, without consideration of his social status, who violates any Sikh rule (*reht*) and confesses before the *Sad Sangat* is awarded punishment by the Five Pyres, usually being assigned tasks such as cleaning of dirty utensils of the *Sangat*, cleaning their shoes and reciting *Gurbani*, or a nominal fine is imposed. Punishment is accepted with grace and even considered a favour received. Records show that punishment was given to Maharaja Ranjit Singh as, more recently, to Master Tara Singh.

OUTSTANDING SOVIET LITERATURE

Vladimir Kuskov:
A HISTORY OF OLD RUSSIAN LITERATURE.
Cloth, Pp. 370, Rs. 8.00

Vladmir Kuskov, a well-known Soviet literary scholar, reviews old Russian literature over the course of seven centuries (from the 11th to 17th) in its close connection with social history. The historicism of old Russian literature and its affinity with folk epics are stressed.

Mikhail Kolesnikov:
SCHOOL FOR MINISTERS.
Cloth, Pp. 502, Rs. 10.00

Mikhail Kolesnikov is a popular Russian prose writer, author of about thirty novels, mainly about Soviet workers. An electrical engineer, he competently describes the conflicts and problems posed by the revolution in science and technology.

The book is also about the working class. It describes Sergei Altunin's career from blacksmith to deputy minister. The character embodies the finest traits of the Soviet worker.

Alexander Blok :
SELECTED POEMS.
Cloth, Pp. 340, Rs. 12.00

The book is dedicated to the 100th birth anniversary of the great Russian poet and presents the best samples of his poetry.

Alexander Blok (1880-1921) was one of the founders of symbolism, he was the bard of eternal feminity, the author of *The Stranger* and *Lady Fair*. The revolution of 1905-1907 made him realise how closely his life was bound up with that of the people and his native country. His superb long poems, *The Twelve* and *Scythians*, included in the present collection, are dedicated to the Revolution, which he sided with wholeheartedly.

A. Kukarkin:
THE PASSING AGE
Cloth, Pp. 380, Rs. 8.00

In this title, the author, Alexander Kukarkin, a prominent expert on art and culture, exposes the spiritual inadequacy and poverty of bourgeois ideology and culture, the anti-human character of "pure art" theories and anti-popular aims of "mass culture." It sums up the leading trends in virtually every sphere of cultural life of Western Europe and the United States: science, literature, the fine arts, theatre, cinema, the press, radio, television and advertising. The book traces the link between philosophy, sociology, aesthetics and artistic creativity.

THREE CENTURIES OF RUSSIAN POETRY.
Pp. 760, Cloth, Rs. 20.00

Modern Russian poetry had its origins in a number of literary genres, including the oral tradition—the songs and sagas, the folk tales and the proverbs, often rhymed and written in recognisable poetic metres. Embodying the best traditions of the past, Soviet poetry, like all post-October literature, made a clean break with the idea of a narrowly professional art intended for the elite. It became an art addressed to the whole people.

Vladimir Orlov:
HAMAYUN: THE LIFE OF ALEXANDER BLOK.
Cloth, Pp. 490, Rs. 11.00

Hamayun, a great black bird with a somberly beautiful human face revered in ancient Russian legends as one possessing prophetic powers, is in this book the symbol of its protagonist, the great poet Alexander Blok, prophet of the Great October Socialist Revolution that was to transform Russia.

An absorbing and well-documented story of Blok's unique road in literature and politics, it demonstrates his evolution from symbolism to revolutionary action.

This is certainly a time of trial for each one of us. Everybody will have to work hard and produce more in order to strengthen the nation. We have to make every effort to increase our production in the farms, in the factories and in whatever fields we are working. Only then will we succeed in the great task that is before us....

We are an independent nation, and we stand firm and erect in our independence. Each one of us will have to pay the price for preserving this independence...

The first thing which we have to learn from this challenge is to put an end to all those tendencies which divide us. Internal dissensions or disputes, whether they are between one region and another or between one language and another, have no place whatsoever in the circumstances of today. The national crisis demands that we should leave such things aside and think about the bigger and more important issues which face us. Therefore, I lay the greatest emphasis on the essential unity of India. We should work for the nation's progress and preserve its unity... Once the feeling of strength and unity is there, our task is easy to accomplish.

Foreign Affairs : Too Many Cooks

THE mess-up over the Prime Minister's proposed visits to Moscow and Washington brings out the present style — or the lack of it — of conducting foreign affairs by the Government.

It was known for long that the Prime Minister's visit to USSR would be taking place some time this year. Apart from the fact that Soviet President Brezhnev's visit to India in December last called for a response from the Indian side, Prime Minister Indira Gandhi was herself planning a state visit to the Soviet Union as part of her itinerary in renewing direct contacts at the summit level with the major powers of the world. The Indo-Soviet understanding and cooperation, regarded as multi-dimensional, extend from exchange of views on international affairs, to security requirements, to projects on the economic front. All these require constant overseeing at the highest level. It is absurd to think that the Indo-Soviet relationship cannot stand the strain of differences in approach towards many issues, all of which may not be exclusively bilateral in character: rather the location of divergence of views on issues and prospects underlines not only the enduring nature of this relationship between two countries which has proved mutually beneficial, but enjoins candid exchange of perceptions from time to time. The blind adherents as well as critics miss this aspect of the realities of Indo-Soviet connection.

India's relations with Washington are on a different footing altogether. If it is a matter of surprise that the Indo-Soviet relationship has hardly encountered rough weather in the last three decades and more, surprise should be still greater that the Indo-US relationship has at all been maintained at a level of normalcy despite the tensions and storms it has had to face in these very three decades. Basically, Washington's difficulty has been its inability to recognise the primacy of India in this part of the world — a reality which Moscow has never failed to respect. Yet there are a host of important issues — bilateral as well as international — which demand constant interaction between the two countries. Here too there could neither be total conformity nor inexorable confrontation; and this all the more demands consultations at summit level. If the Reagan Administration has demonstrated lack of sophistication — not to speak of understanding — in dealing with sensitive issues of vital interest for this country, it is all the more necessary for India's Prime Minister to meet and try to thrash these out with the US President. It is an infantile view of international relations that looks upon a summit meet as the end-product of friendly bilateralism alone and refuses to recognise it as an imperative in dealing with estranged relationship. The absurdity of such a logic is brought out by the very concept of detente which recognises antagonistic relationship and seeks to contain it.

It is therefore perfectly normal and necessary that the Indian Prime Minister should plan to meet the US President. The brief encounter at Cancun last year between Indira Gandhi and Ronald Reagan was in the nature of diplomatic courtesy; if anything, it underlined the need for a well-prepared summit. The need for such preparations was obvious when Secretary of State Haig had planned

to visit New Delhi but abruptly put it off on the plea of the Polish crisis. No doubt there has come a series of urgent international developments to keep the US Secretary of State busy, but it is perfectly valid to infer that in Washington's present perception, India figures way down in the list of priorities, despite the stationing of the largest US armada in this country's neighbourhood and the US arming of Pakistan with sophisticated weapons as part of its so-called strategic consensus, ignoring the misgivings questioning the wisdom of such a step voiced not only in this country but by a considerable section of US opinion as well. If all these could not persuade Secretary of State Haig to reschedule his visit to New Delhi, it only warns that the preparations for an Indo-US Summit could not be and should not have been taken up in a haphazard fashion.

This is precisely what seems to have happened.

For one thing, it was strange that the Prime Minister's itinerary should have included Washington as virtually an extension of her long-planned decision to address the UN special session on disarmament in June. A visit to Washington should have been planned as an independent exercise unencumbered by any other major engagement en route. Besides, it is common sense to anticipate that India's Prime Minister, as the leading voice of the nonaligned community, would have been inhibited in her disapproval of the record-breaking spending on arms build-up by the Reagan Administration which threatens at the same time to cut down aid to developing countries apart from slashing down social service at home: an issue which in some form or other has to figure in India's contribution to Disarmament debate in UN. Obviously, this viewpoint, truly reflecting India's stand, would have been muffled when all the time there would have been anxiety about its impact on Washington, which the Prime Minister was billed to visit immediately afterwards.

Much in the same way it was thoughtless to have arranged for a quick stop-over at Moscow as an extension of the Prime Minister's long-prepared Scandinavian trip. The reasoning behind this awkward planning as could be gleaned in New Delhi is that since the Prime Minister is due to visit Washington in June along with her participation in the UN debate on Disarmament, she should visit Moscow first. Since President Brezhnev has already visited India while President Reagan has not, it was thought necessary by the Prime Minister's advisers that she should visit Moscow first. In the bargain, the Prime Minister's original plan for a state visit to USSR some time in September got disrupted, and in place of adequate preparations, there was perceptible hustle to somehow get the Moscow visit through.

There seems to be a super-power complex in New Delhi. Although it is theoretically denied in official circles that there is any attempt at maintaining a posture of equidistance between the two superpowers —an attitude which had been severely repudiated by Nehru himself — there are persons in key positions in the Indian establishment today who would seem to feel more at home with the Janata's so-called "genuine" nonalignment, which is but an euphemism for equating USSR with USA with regard to India's national interests. What is missed in this approach is that the live experience of three decades of our foreign relations has made it abundantly clear as to which one of these two has found it worthwhile to respect India's national interests and which has not. In effect, this failure to understand the differentiation that has been forced by the compelling realities in our approach to the two super-powers leads one into practical difficulties such as the present mess over Indira Gandhi's projected visits to Moscow and Washington. Such a mess brings credit for the Government neither at home nor certainly abroad.

A logical corollary of this equidistance complex is the anxiety to demonstrate before the West as if India is apologetic about its positive relations with Moscow. What is forgotten in this naive view of foreign policy is the hard fact that the West (including President Reagan) would treat India with greater deference and consideration when it realises that India is an independent power and that it is not ashamed of its time-tested relationship with Moscow. At a time when West Europe refuses to toe the Washington line of angry confrontation with Moscow, it is amazing that there should be chicken-hearted people in authority here who in their subconscious state cannot think independently of the West. While for instance, the pathetic performance of Britain over the Falklands has brought out its decrepitude even militarily when facing a Latin American weakling like Argentina, there are people here in responsible positions who are yet to wake up to the awareness that Britain has long lost its old imperial glory.

The position of India both in terms of its internal strength and its crucial location in the geopolitical map of the world is such that it can do business without any complex with both USA and USSR without having to lump these two in an unreal category so far as India's national interests go. While the relationship between any two countries in the interdependent world of today cannot be totally exclusive, it is prudent for us to learn from our rich experience in handling both Moscow and Washington that these two could be and should be handled separately and independently. A trip to Moscow in September need not have preceded nor followed another planned for Washington. Both need thorough preparations and the approach and problems to be taken up with one are certainly not those to be put on the agenda with the other.

And finally, no convincing explanation has so far been forthcoming why the two trips have been put off. If it is the question of the Prime Minister's preoccupation with the coming Presidential elections — as is now made out — then it is extraordinary that this was not thought of when she announced the two visits in June only a few weeks ago. The date of the Presidential poll was not a sudden development.

For all this mess it would be unfair to blame the Foreign Office alone, nor need one rush to lampoon the much-maligned IFS. The fault lies in the functioning of the establishment itself. If one were to piece together the drama of this mess-up, one would be amazed at the lackadaisical manner in which foreign affairs is handled in New Delhi today — much in the same way as the affairs at home are dealt with. The same lack of direction, the absence of a well-thought-out perspective, neglect of any tactical approach, indifference to details can be discerned. The mere urge to play a big role in the comity of nations can lead us nowhere. There is no policy planning at all in the entire Government, certainly not in the Foreign Office or the Prime Minister's Secretariat.

If one were to examine how this question of Moscow and Washington visits has so far been handled, it is clear that more than the Foreign Office, the Prime Minister's Secretariat figured prominently. But the Prime Minister's Secretariat today has no expertise whatsoever on foreign affairs. The Principal Secretary may be a clever person but he is conspicuously innocent of foreign-policy developments: his anxiety to arrange for a quick visit by the Prime Minister to Washington is understandable, but he has neither the acumen nor the experience of handling such a major international issue: dealings with Moscow or Washington can hardly be left in charge of any novice. The Prime Minister is known to be taking counsel of non-official advisers, but here too there is neither coordination nor any sustained policy-planning exercise: After all international issues can hardly be taken up as a ramble-thought pastime.

Above all, there is lack of coordination between the Foreign Office and the Prime Minister's Secretariat. There is no attempt at institutionalising the crucial links. The role of the Foreign Minister in decision-making has become marginal while he has to take the responsibility before Parliament for all issues of foreign policy. There is of course much to be desired in the functioning of the Foreign Office itself: it is unwholesome to let the Secretaries function almost autonomously. Of urgent concern is the need to strengthen the external publicity apparatus. In recent weeks, the so-called spokesman of the Foreign Office has displayed a level of juvenility which is indeed unprecedented. Instead of clarifying any foreign policy stand, this has only added to the confusion.

At the root of it all is the bane of ad-hocism. The wages of drift can indeed be heavy in the complex field of international relations.

May 5 *N.C.*

COMMENTARY

Giani's Baby?

THE Punjab scene contains an assortment with varied elements — good, bad and mischievous — all thrown together without anyone at the helm of affairs having the will to identify the forces at work: to isolate those representing, in the first place, a threat to the comity of the Punjabi people themselves, apart from their national import. The result is that communal forces of different hues, never so strong in the State's life as to be more than a secondary force, are now having a field day.

The question is: who is to blame for this slide down in Punjab? How come that such crude devices of whipping up communal tension as the throwing of slaughtered cow-heads before temples and cigarette butts before Sikh shrines are allowed to raise tension to the point of serious communal manifestations?

The answer is not difficult to divine, for it is in the very hub of power at the Centre — the Union Home Minister's own outfit — where a major share of the responsibility lies. Laxity in dealing with the foreign-propped elements — the Dal Khalsa and the National Council of Khalistan — is deemed to be the prime factor responsible for the present slide down in the State's affairs. To say that, however, would be an understatement.

It is not just laxity, but actual encouragement to these very foreign-backed forces through tacit actions of the Union Home Minister, climaxed in his opposition to the Punjab Government's demand for banning these organisations, that should be nailed down as the cause for the present situation in Punjab. Actually, it is the pathetic infighting for power in Punjab that has been allowed to get the better of Giani Zail Singh's judgement of happenings in his home State. The result is that Chief Minister Darbara Singh's endeavours to crack down on the extremist communal-cum-foreign-backed elements have actually been undercut from the Centre by Giani holding on to the crucial Home portfolio. These elements have little backing among the Sikh masses whose healthy instincts would never allow peace and goodwill in the land of their toil to be wrecked by the insidious actions of a handful.

Witness the manner in which Zail Singh allowed the Bhindranwale spectacle to be enacted right in the Capital, with the Home Minister seeking the blessings of the self-same Sant. Witness again the statement made by the Union Home Minister in Punjab, in response to Darbara Singh's demand for banning the Dal Khalsa! Was it for the Home Minister to reject the demand for banning the organisation on the spur of the moment? No doubt the saner sections in Punjab as well as outside have heaved a high sigh of relief when the Union Cabinet over-ruled the Giani and ordered the banning of Dal Khalsa — a step which the Union Home Minister had turned down when it had been raised in Parliament only the day before.

What has been creating the mischief in Punjab is, besides the Congress(I) factional war between the Chief Minister and the Union Home Minister, the pathetic approach to the problem of extremists and communal forces. The fact is that the inability of the Government — again largely because of the Union Home Minister — to isolate the extremists from the main body of public opinion, and to give them more credit in terms of popular support than is actually the case, has served to encourage the extremists. After the rebuff that they suffered recently, when the America-based Ganga Singh Dhillon was expelled from the Delhi airport, there should have been no quarter given to the Dal Khalsa and their cohorts. The warning signal came when the heads of slaughtered cows were found outside a temple in Amritsar. But the Union Home Minister failed to take note of it even when the Dal Khalsa activists owned up this misdeed. How long will this situation continue? It is high time for the Prime Minister to act decisively.

At the other end, the Centre has also been lax in considering what should be evident as the genuine demands of the Sikhs, and of all Punjabis. The clearance of the Thein Dam now may be in the category of belated action in the right direction; so too is the move to cordon off the Golden Temple in Amritsar from the shops that sell cigarettes, alcohol and meat. But even more important is to provide the final solution to the Chandigarh question and to find speedy ways of its merger into Punjab. Perhaps the elections due in Haryana shortly may not be conducive for such an action. But the elections will be over in a fortnight, and then would be time to bring to a conclusion a long-standing point of dispute between the two neighbouring States of Punjab and Haryana. It is to the benefit of both that the solution is found speedily.

May 4 *O.P. Sabherwal*

Road to Equality?

IT is some consolation that the Union Government, according to Minister of State for Home Affairs Venkatasubbiah, realises that the Mandal Commission report on backward classes has raised important and complex issues with wide implications for the country.

This is presumably what persuaded the Government to sit tight on the report for sixteen months. It could easily have been placed before Parliament during last year's Budget session, but it was only after much noise at the beginning of March this year that Home Minister Zail Singh promised that the report along with the action taken would be presented to Parliament, though Minister of State Laskar said the report had not yet been circulated to the States. Sixteen months is evidently not long enough for such circulation, consultation and action. From here to Eternity is the undying formula in such matters. And by presenting it on April 30, 1982, the Government deftly avoided the embarrassment of a debate.

The sensitive nature of the problem does not have to be stressed. The Bihar Janata regime's over-dramatised move in 1978 to provide additional reservation of jobs and seats to backward castes, immediately followed by a well-planned violent agitation against the very concept of reservation for the weaker sections, and the early 1981 agitation in Gujarat by medicos directed against Harijans and the weaker sections generally, had lessons, but who learns?

The Mandal Commission has recommended that 27 per cent jobs/seats be reserved for backward castes (3,743 of them) in the Central and State Governments, public undertakings and educational institutions. These castes are estimated to form 52 per cent of the population. Then there are the Scheduled Castes and Tribes, for whom continuance of the present 22.5 per cent is recommended. Together the Commission wants all reservations to be within the ceiling of 50 per cent laid down by the Supreme Court. That is a necessary concession to the plea for "merit", but neither endless reservation nor spurious ideas of "merit" being everlastingly bestowed upon the upper castes or the well-to-do can be accepted.

For 32 years we have had reservations for Harijans and Adivasis, and the condition even today of the vast majority in these two categories does not have to be underlined by citing statistics about placement in decent jobs or notorious facts about the kinds harassment, humiliation and worse to which they continue to be subjected. "Reservations" for over three decades and tall claims about emancipation, yet the bulk of them are illiterate and remain below the poverty line—itself a misleading yardstick, for it can mean anything from total to partial starvation. There is no denying the fact that in the case of Harijans and Adivasis, as more recently in the case of other backward castes, the concessions and facilities provided have gone to small groups that have in turn become a new privileged class. Harijans and Adivasis have been exploited by all the hierarchical caste layers above them.

No one can seriously quarrel with the Mandal Commission's view that there can be no equality for "the strong and the handicapped ... in the race for life" and that there can be "equality only among equals". That is the whole point of the Constitutional safeguards for the weakest sections and the minorities. But the argument would apply not only on a caste basis, though caste remains a factor, but also on the basis of actual poverty and misery.

The Commission is clearly right in warning against any facile assumption that the caste system is on the way out. Thanks to the centuries-old hierarchical system and to the mileage political parties have for years been trying to get out of its perpetuation, the effort of the influential and the powerful is to keep the unequal system going. Without the abolition of the pernicious exploitative and inhuman system based on birth, we can never hope to live up to the Constitution.

Those among the privileged who oppose reservation in order to look after their own progeny must ask themselves honestly about the injustice suffered for long centuries by the Harijans, Adivasis and other backward sections; but those who are vociferous about extending reservation more and more must also take careful stock of how many among the intended beneficiaries really gain, to what extent reservation is misused by the better-off among the backward castes themselves to get entrenched and ride on the backs of the weaker among their own caste-brethren. Caste is indeed becoming a more and more potent factor in political life — and consequently in social and economic life — and this trend, given our national lethargy and acquiescence as also sectional arrogance and power-lust, can hardly lead to a society based on social justice.

Reservations of the kind recommended cannot be avoided if the weaker sections are to hope for equal social and economic status at some future date; but if the benefits of reservation are cornered by the powerful few in each of these castes, leaving the majority out in the cold, the purpose will not be served. If it is true, as the Commission has pointed out, that the institution of caste will not wither away "in the foreseeable future", it is equally true that we can never build a strong, united nation on egalitarian principles if we — starting with the enlightened sections — do not organise a full-scale war against the pernicious caste system, which in such an event will be defended by a bizarre combination of powerful vested interests cutting across castes. The answer is to end the caste system — but that is a long haul, even if a beginning is made now.

There is no painless road to the 'socialist secular democratic republic" which we claim to stand for.

FOCUS

Velayati's Visit

OBSERVER

UNITY has not been one of the strong points of the non-aligned world of late, and it is therefore not unnatural that there should be a sharp polarisation within it between those who want the summit to be held in Baghdad come September and those who don't. Given the divisions within the Arab world itself, it is not surprising that this polarisation should have become accentuated to a point where the choice of the summit venue has proved to be highly controversial. When Iraq's offer to host the summit was accepted at Havana, its war with neighbouring Iran was at least a year away and neither country had reason to believe at that time that they would be involved in a prolonged skirmish. When the Iraq-Iran war broke out, the majority of the non-aligned countries thought it would be over well ahead of the proposed summit.

Now they are torn between Iran's demand for shifting of the venue and Iraq's insistence, backed by several countries friendly to it, that Baghdad remain the venue even at the cost of Iran's boycott of it. India is a friend of both Iran and Irab, and faced an obvious dilemma. Indira Gandhi neatly extricated India out of it by resorting to the technical argument that since a summit had chosen the venue, only a summit can rescind its own decision. In other words, New Delhi signalled the world that Indira Gandhi would go to Baghdad whatever the state of Iran-Iraq hostilities at summit time. Last week, the Iranian Foreign Minister, Dr. Ali Akbar Velayati, was in India arguing Iran's case and had to return home empty-handed. New Delhi apparently appreciated the strength of his arguments but advised him that the only possible solution to this crisis lay in a speedy end of the war through a negotiated settlement in hastening which India, as one of the four-member non-aligned panel of negotiators, was ready to play its part. Dr. Velayati told a press conference in New Delhi that he had failed in his mission, but that he continued to hope that the number of countries that intended to boycott the summit would increase because "Iraq has trampled upon the basic principles of non-alignment by invading Iran".

The joint press statement issued at the conclusion of Dr. Velayati's visit failed to record either Iran's objections to holding the summit at Baghdad or India's response to them. Instead, it emphasised the need to reassert the role of the non-aligned movement as an independent non-bloc factor and as a positive force for the preservation and strengthening of peace and security in the world. Considering that the "independent non-bloc factor" has had no purchase in the Iran-Iraq belligerence, this formulation must be seen as a routine tribute to the ideals of a movement which has not been of much avail in bringing two non-aligned countries together. "The Iranian side", says the statement, "briefed the Indian side of their views on the Iraq-Iran war. The Indian side expressed the hope for a just solution of the dispute in the near future". The operative phrase here is obviously "near future", but whether New Delhi's pious hopes will materialise is another matter.

Iran has lately shed some of its earlier inhibitions in regard to modalities for bringing about a political settlement of the Afghan crisis and has now persuaded itself to participate in the UN-sponsored efforts in that direction. It is yet early to hope for a fruitful outcome from the coming Geneva meeting at which the three countries involved in the Afghan situation, Iran, Pakistan and Afghanistan, will face one another at a common negotiating table, but it is a matter for gratification that Iran will attend it. The reference in the joint statement to the Afghanistan situation is in conformity with the formulation adopted by the non-aligned Foreign Ministers in New Delhi last February. Dr Velayati's commitment to a "just and comprehensive settlement of the question on the basis of withdrawal of all foreign troops" is to be welcomed.

Both India and Iran have good reasons to be pleased at the bilateral aspects of Indo-Iranian relations in the consolidation of which the agreement to set up in the near future a joint commission is bound to prove a mutually beneficial arrangement. While the Indian side stated its readiness to share its technical and scientific expertise with Iran, the Iranian side reiterated its desire to co-operate with India in all fields including agricultural and industrial collaboration and commercial exchanges. There is here immense scope for building up a mutually reinforcing relationship of independence, self-reliance and friendship. Specifically, while Indian technical know-how and skilled manpower can aid Iranian reconstruction in a big way, the established Iranian expertise in oil industry can be of great benefit to India. Dr Velayati's visit thus marks a second stage in the furtherance of Indo-Iranian economic cooperation. A cultural agreement is also to be signed shortly to put the existing cultural contacts on an institutional and regular basis.

Dr Velayati promised that Iran would do everything possible to solve the Kudremukh problem to the mutual satisfaction of both countries. There may however be a wide gap between intention and fulfilment. As of now, Iran is not in a position to use the Kudremukh ore concentrates; the steel plants which would have consumed them are yet to be completed. It is doubtful if the war-time conditions will permit their being constructed at all. Teheran has also developed second thoughts about certain provisions in the 1975 Kudremukh agreement, and a dispute has developed over the capacity of the project and the price of ore concentrates. Dr Velayati sounded optimistic at his press conference over the likelihood of an agreement when an Indian team visits Teheran in the near future. It is difficult to share his optimism because Iran has virtually reneged on its credit commitments for the project and India has had to mobilise resources to finance it after Iranian payments stopped. Of the committed 630 million dollar credit, only 357 million dollars were remitted to India when further disbursements stopped last year. India will be wise not to bank too heavily on the prospects of an agreement on this and several other allied points in dispute but instead carry through the proposed pelletisation project with Romanian collaboration to make use of the concentrates. If and when the dispute with Iran is resolved, the Kudremukh project can be expanded to take care of Iran's needs also.

However, the fact that the

SCRAPBOOK

The Last Hurrah

C.P. RAMACHANDRAN

ENGLAND has started many wars for many reasons. It started war against Burma when King Thibaw was found making faces at a British naval officer. It started war in Africa when a Black man refused to give up his seat to a White. But that was common. It started a war when a Spaniard cut off a piece of the ear of a certain Jenkins. Then Drake and other pirates singed the Spanish king's beard. It went to war against Afghanistan because the Afghans were being wooed by Czarist Russia. It fought the Zulus to help the Matabeles and went to war with the Matabeles when they became too powerful for the Zulus.

Britain now crowns her glorious career of war to safeguard the sacred rights of some 1800 sheep-farmers in the Falkland Islands.

What rights? Presumably, the right to tend their sheep. But the Argentines have not denied this right. Perhaps, the Islanders tend their sheep in a British manner while the Argentines have their own method. As most of the Islanders are of British stock this attempt to indegenise sheep-farming is perhaps being taken for an attack on their way of life. As a partner of NATO and the chief ally of the United States, Britain is committed to safeguard the inalienable rights of man, the pursuit of truth and happiness and the tending of sheep in the time-honoured manner. That is why the Mother of Parliaments has taken this decision to resist the invaders.

It is even possible that British intelligence, that vigilant watcher in the interests of parliamentary democracy, has discovered another Soviet plot in Argentina. After all, that country has a large trade with the Soviet Union in wheat and livestock. What does Gen. Leopoldo Galtieri get in return? The matter is well worth watching. It may be remembered that Jimmy Carter, a little before the Presidential election, discovered that Cuba had a new brigade of Soviet-trained troops. He nearly ordered the mobilisation of the US Fleet to face this dangerous threat to the security of the US.

Talking of security, one recalls that once upon a time somebody, perhaps it was John Foster Dulles or even Minoo Masani, said that the US's frontier was at the Mekong. The Mekong has unfortunately gone out of the hands of the US. Still, the idea is perfectly valid. Britain, for instance, said that it needed Gibraltar to guard the Mediterranean. It needed the Mediterranean because Cyprus and Malta were in that sea. Cyprus and Malta were needed because of Aden. Aden had to be built up because of India. India was meant as a base to protect Singapore. The Singapore naval base in the old days was meant to look after the security of such outposts as the Federated Malay States, Brunei, Sarawak and Hong Kong, all of them so vital for the British Empire on which the sun did not dare to set. Perhaps the British frontiers now extend to the Falkland Islands and spill over to Antarctica. Remember the fuss in the Western press when an Indian team of scientists landed in Antarctica? What was India doing in a place which was clearly marked out as a region over which Western interests must prevail?

To the list of great naval battles of the past, Trafalgar, Aboukir Bay, Scapa Flow, Leyte, Lingayen Gulf will now be added the action on Stanley. Winston Churchill's reaction when the *Hood* was sunk was to remark tersely: "The *Bismarck* must be sunk", or words to that effect. It is not known whether Margaret Thatcher bit her lips and stuttered, "*The General Belgrano* must be sunk". It may not have been sunk as yet but certainly British torpedoes have hit the cruiser. This is a considerable achievement for the British task force because the cruiser, although it was outside the war zone, constituted a threat to British aircraft carriers, destroyers and submarines. It is a powerful warship, having been on active combat duty at the time of Pearl Harbour, therefore, only forty years old. Nelson's spirit must be happy.

Britain is taking no chances. If the foolish Argentines do not surrender or withdraw from the Falkland Islands, as a result of conventional warfare, well, other means will be sought. It is not for nothing that the task force includes a nuclear submarine. The British Chiefs of Staff will recall the statement of an American Major that "in order to save Nam Dhan, Nam Dhan had to be destroyed". They may well say now that in order to save the Falkland Islands, they have to be destroyed first. That is why the nuclear submarine is there, shining and ready.

President Ronald Reagan will understand the feeling. So will Al Haig. Didn't the latter say at the Congressional inquiry to approve his posting as US Secretary of State that sometimes it was necessary to go to nuclear war to save a situation? Of course, he was right. Only he was hoping that these exercises will happen in Asia (preferably on the Sino-Soviet border) or in the Middle East (preferably in Iran) or in any part of Africa, except in that bastion of democracy, South Africa. At worst, it could happen in West Europe. Reagan has said that tactical nuclear battles in Europe need not lead up to a world war. He should know. Isn't he the leader of the Free World?

What is missing is eloquence. One would like to hear reading about Francis Pym, Britain's Defence Minister, saying with tears in his eyes, "Roll up that map of the Atlantic. We shall not need it again". Or, Lord Carrington murmuring, "The lights are going out over Port Stanley". Or, Enoch Powell thundering, "We shall fight on the beaches, on the mountains, on the streets". Instead of streets it would perhaps be more appropriate to substitute pastures. But that may lead to the Bible. For, Powell who knows his religious onions will say: "She (Margaret) leadeth me to the green pastures. My whiskey runneth over".

But there is of course no point in carrying on the comparisons between the days of the Battle of Britain to the present events of the Battle of Falkland Islands too elaborately. At the end of the War, the victorious Churchill was thrown out of office ingloriously. Will the Tories get thrown out after the war with Argentina? "Let us see", Powell said during the debate in the House of Commons, "what metal the Iron Lady is made of". An iron lady cannot be made of peat which is the soil of the Falkland Islands. She must be either iron or at best steel. Nobody said about Wellington, "Let us see what metal the Iron Duke is made of". It would have made the victor of Waterloo furious. Wellington had a fine opinion of himself. Once someone told him that one Jones was often mistaken for the Duke because he had the same features. "Funny", said the Duke, "nobody has mistaken me for Mr Jones".

Now that is the kind of repartee that Maggie Thatcher must indulge in if she wants to go down in history. Mere reiteration of unemployment figures is somehow not good enough. ☐

BJP Strategy in Kerala

GIRISH MATHUR

THE Bhartiya Janata Party is fielding 63 candidates for the 140-member Kerala Assembly, while the CPI(M) has put up 51 and Congress(I) 35 on their own party symbols. The CPI(M) is leading the Left-Democratic Front (LDF) which includes seven other parties, and the Congress(I) has forged the United Democratic Front (UDF) embracing ten other parties; the two Fronts are contesting all the seats. The BJP however has no allies.

Although this is not the first election in the State in which those who now constitute the BJP have entered the fray, this certainly is the first occasion when they are trying to make themselves felt in the electoral calculations of the two major parties. Reports indicate that both the major parties were anxious to reach an electoral understanding with the BJP, informally and under-cover if not formally and above board. Some of the top leaders of the CPI(M) are on record that an electoral arrangement to defeat the "authoritarian forces" (euphemism for Indira Gandhi) could not be ruled out; reports from Kerala suggest that the Congress(I) State leaders were trying for seat adjustments with the BJP even after the nominations had been filed.

Not that the BJP was against any understanding with the two major parties. It is conceded by all observers of the Kerala scene that the BJP would have bagged a couple of seats and entered the Kerala Assembly for the first time if it had come to some overt or covert understanding with the Congress(I)-led front. But the central leadership of the party barred any local electoral arrangement which would run counter to its all-India posture of being the only national alternative to the Congress(I). In the so-called Vrindaban Document, the party's central leadership had claimed that in some States it had already become the only alternative to the Congress(I) while in some others it was gradually emerging as one. Himachal was named in the document as one of the States where the party claimed it was recognised by the people as the only alternative to the Congress(I) which seems to be why it has not entered into any electoral arrangement with other non-Congress(I) parties in that State as it has done with the Lok Dal in Haryana. (The BJP however has left some seats for the Lok Dal in Himachal and Charan Singh has agreed to compaign for it in that State.) Since it has not entered into any electoral arrangement with other non-Congress(I) parties in Kerala and is fielding the largest number of candidates put up by any party single-handed, it can be assumed that the party regards Kerala as one of the States in which it hopes to emerge as the only alternative to the Congress(I).

However, CPI leader Balaram has said he suspected a secret or unwritten understanding between the BJP and the Congress(I) and that the BJP candidates might ultimately retire or remain in the field wherever this would help the Congress(I)-led front. Only the election results will show whether the presence of such a large number of BJP candidates actually helps the Congress(I)-led front or whether the BJP hopes about emerging as the only alternative to the Congress(I) are justified. At the moment, however, the following facts strike an observer of the election scene in Kerala:

The BJP has not set up its candidates against former CPI(M) Chief Minister E.K. Nayanar and former CPI Chief Minister Vasudevan Nair although both are contesting from their old constituencies in which the RSS has made some inroads. But the party has not spared the two former Chief Ministers contesting on behalf of the Congress(I)-led Front, the Congress(I)'s Karunakaran and the Muslim League's C.H. Mohammad Koya. It is recognised by unbiased observers that a division in the votes of the non-Muslims in Mohammad Koya's constituency would have helped him if he was not being challenged by the rival Muslim League's candidate contesting on behalf of the CPI(M)-led Front; as it is, the BJP nominee in the constituency would divide the anti-Marxist vote and would thus indirectly help the CPI(M)-led Front. As far as Karunakaran is concerned, he found his BJP rival in his home constituency, to be such a serious candidate that he has decided to contest from one more constituency; nobody says that the BJP nominee in Karunakaran's home constituency can win, but he will certainly divide the anti-Marxist vote and thus reduce chances of Karunakaran's victory.

Tellicherry is a constituency in which the CPI(M) and the BJP have been engaged in physically annihilating each other's cadre, and yet in that constituency the BJP is not fielding any candidate; the outcome of the contest in the constituency would be watched with interest and would show whether the absence of a BJP candidate helps the Congress(I)-led Front by not dividing the anti-Marxist vote or it helps the CPI(M)-led Front by not dividing the anti-Congress(I) vote. At the moment all that can be said is that it is really surprising that the BJP has left this constituency to the two rival Fronts to fight it out.

The Muslim League is the BJP's *bete noire* and one would have expected that it would concentrate its fire against all Muslim League candidate on whichever Front's' behalf they might enter the contest. But like other smaller parties, the Muslim League too is divided and one group has joined the Congress(I)-led Front while another group is a constituent of the CPI(M)-led Front, and the BJP is concentrating its fire not on both the groups but on the one that has joined the Congress(I)-led Front.

These facts do not support Balaram's suspicions that the BJP has entered into a secret deal with the Congress(I) or that, even if there is no secret understanding between the two, the BJP's role would help the Congress(I). On the contrary there are people who suspect that the BJP has entered into a secret deal with the CPI(M). But this commentator is not one of those who entertain such a suspicion. There are at least two quite sound reasons why neither side can come to a secret electoral understanding with the other in Kerala, namely, (i) the opposition of the CPI to the BJP is so strong that some people take the BJP, not the Congress(I), as the CPI's main enemy, and at least in Kerala the CPI(M) cannot afford strains in its relations with the CPI at this time for the sake of some dubious electoral gains, whatever might be the attitude of the central leadership of the CPI(M) towards the BJP; and (ii) the local cadre of the BJP can have no truck, direct or indirect with the CPI(M), their arch-enemy in the field, and it is known that during the days when the fate of the Nayanar Ministry was in doldrums the local unit of the BJP had to be threatened with disciplinary action to restrain it from doing anything that would have expedited its fall.

What then could be the aim of the BJP's electoral strategy? In seeking an answer to this question, this commentator proceeds from two assumptions: (i) the local as also the central leadership of the BJP is not so unrealistic as to imagine that it can provide an alternative to the Congress(I) and the CPI(M) in Kerala as of now; the best it can hope for is to get a couple of seats in the Assembly; (ii) even on the national plane, the BJP does not look upon itself as an alternative to the Congress(I) in the sense in which the Left aspires to become one — which should be evident from two facts: (a) the BJP has not put forward an alternative programme before the people and its policies have been formulated within the same framework as that of the Congress(I) policies; (b) in the so-called popular struggles, the BJP does not raise fundamental issues and strikes the posture of fighting against the Congress (I) on non-issues like corruption. However, on the national plane and in the State of Kerala, the BJP poses an alternative to the Congress(I) in another sense which, to this writer, is the *raison d'etre* for the party's electoral strategy.

Traditionally, the Congress electoral strategy used to be based on a coalition of the religious, linguistic and regional minorities and the weaker sections of society, particularly the Harijans and the Adivasis; it differed from State to State according to the variations in the alignments of these castes and communities. But since the 1980 elections the Congress(I) has been pursuing the strategy of seeking a coalition of Muslims, Harijans and the Rajputs (feudals) against the so-called backward (kulak) castes; in Kerala in this election the Congress(I)-led Front is seeking power by forging a coalition of Muslims, Christians, Nairs and Ezhavas which should be evident from the large number of seats allotted to the caste grouping of the Nairs, the National Democratic Party, a similar grouping of the Ezhavas, the Socialist Republic Party, and the groupings backed by the church and mosque, the Mani faction of the Kerala Congress and the Koya faction of the Muslim League.

The BJP also seeks caste-based coalitions, but its effort has always been to mobilise the Hindu electorate on a religious basis. The religious appeal has become the most prominent feature of the RSS strategy since the Meenakshipuram conversions, and it is the RSS which provides the brain and the brawn to the BJP, whatever be the latter's rhetoric. In Kerala, its main effort is directed at breaking up the emerging coalition of the Muslims, Christians and the two Hindu castes; the mosque and the church are the main enemies of the BJP. That this is the main thrust of the BJP's electoral strategy should be evident from the fact that by and large it has refrained from setting up its candidates against the (Nair) National Democratic Party and (Ezhava) Socialist Republican Party nominees seeking election on behalf of the Congress(I)-led Front — which is probably what has led Balaram to suspect a secret deal between the BJP and the Congress(I).

In the short term, the BJP's efforts to break up the emerging Muslim-Christian alliance with its potential allies, the Nairs and the Ezhavas, might prove advantageous to the CPI(M)-led front. But the BJP is trying to break up this coalition to be able to rally the Hindus on the basis of its religious appeal and the cry of "Hinduism in danger". This cannot be in the long-term interests of the CPI(M) or any party of the Left. By its short-range policy of forging a religion and caste based coalition to return to power, the Congress(I) is providing grist to the BJP mill. (*May 4*).

Global Inter-dependence and National Development

View from India

K.R. NARAYANAN

The author is the Ambassador of India in USA. This contribution is the Keynote address delivered by him at the Eighth Annual Third World Conference organised by Governors State University, Chicago. (March 25, 1982)

WHILE the world has shrunk to "a global village" and become increasingly inter-dependent, forces have also been at work in the opposite direction pulling towards disunity and discord. For us in India this duality has been a perennial experience and the constant endeavour in our history has been to find unity in diversity, to reconcile the individual to the society, the locality to the nation, and the nation to the world.

It is well-known that the Indian mind has been inward-looking and preoccupied with the question of individual perfection, the realisation of the self and the salvation of the soul. What is not so well-known is that Indians from ancient days had thought of humanity as one family, a single nest, and "the whole world of mortals as an inter-dependent organism" as the Mahabharata put it. In modern times Mahatma Gandhi turned the inwardness into a dynamic force by pitting his individual mind and soul against the might of an empire through his method of non-violent non-cooperation. While he was prepared to stand alone, he saw life as an ever-widening circle of relationships in which the individual must work, and if necessary, sacrifice for the family, the family for the village, the village for the nation, and the nation for the world. He once said: "My service of India includes the service of humanity. Isolated independence is not the goal of the world states. It is voluntary inter-dependence. The better mind of the world desires today not absolutely independent states, but a federation of inter-dependent states. The consummation of that event may be far off".

This far-off vision was before India when she became independent and it was in the light of it that Jawaharlal Nehru declared that India proposed to pursue her national interests in the context of international cooperation.

Frist of all, we needed peace around us and in the world to enable us to concentrate upon the questions of social aad economic development of a country that was emerging from colonial domination and a long period of arrested growth.

Secondly, we did not want to be drawn into cold war conflicts and be forced to take sides in the military-cum-ideological struggle of the two blocs, which would have not only disturbed our peaceful environment but divided our own people.

Thirdly, we wanted friendship and lines of communications kept open with all countries so that we could get cooperation and assistance from all possible sources for our economic development.

Fourthly, for consolidating the unity of a country as vast, diverse and problem-ridden as India, it was necessary to lift the sights of the people to wider horizons beyond India and to cast their lot with the future of the world itself.

And finally, looking from the vantage point of our historically evolved world-view we perceived that modern developments, particularly the consequences of scientific and technological progress, were beginning to translate the old concept of an inter-dependent world into a palpable and practical reality.

Thus on the eve of our Independence Jawaharlal Nehru stated our credo as follows: "The world, in spite of its rivalries and hatreds and inner conflicts, moves inevitably towards closer cooperation and the building up of a world commonwealth. It is for this One World that free India will work, a world in which there is free cooperation of free peoples, and no class or group exploits another".

It was out of this totality of considerations that the policy of non-alignment and peaceful co-existence emerged which steered India clear of cold-war alignments towards the objective of friendship with all nations and peace in the world.

If we were obsessed with the question of war and peace, especially with the issue of nuclear war, it was not the result of moralistic posturing or idealistic frothing, as made out by writers in the West, but because of our understanding of its impact on India's interests and aspirations, and on the future of mankind. Today it is impossible to discuss the question of global inter-dependence and national development without facing up to this overriding nuclear issue. One touch of the threat of nuclear war, if I may appropriate a line from Shakespeare, is today "making the whole world kin." It was nearly twentyfive years ago that Jawaharlal Nehru declared that in this nuclear age the choice for mankind was between "co-existence or co-destruction."

I cannot but recall a friendly debate that Nehru had with Chairman Mao Tse-tung in 1954 when he visited the People's Republic of China. Those were the perfervid days of the doctrine of the inevitability of war. Mao expounded that the invention of nuclear weapons had not changed the nature of war in any substantial sense, except in its scale, and that even though 200 or 250 million people would be killed in a nuclear war, millions will survive particularly in the villages of countries like China and India. Nehru, on the other hand, argued that nuclear weapons have changed the nature of war and that, apart from the destruction it would cause of civilisation as we knew it, the effects of radiation would leave mankind virtually annihilated. It is fascinating that though Mao is no more and de-Maoisation is supposed to be taking place in China, the shades of this doctrine still haunt several unlikely places, and we now hear much talk about the possibility of a nuclear war, and winnability in such a war.

Neither global inter-dependence nor national development is of any avail unless this mad career of nuclear-missile armaments is arrested and reversed Behind this arms race is not merely arms but the concept of an irreconcilable conflict between two super-powers and two blocs. This concept is totally contrary to that of global inter-dependence. The Indian approach has been that there is no conflict in the world that cannot be resolved through peaceful means and through mutual accommodation, and even if conflict is imposed on us to wage it with the future of the peoples concerned and of mankind in mind and, in the words of Nehru, with "the hands of friendship never withdrawn." The idea of an everlasting enmity is alien to the human mind and heart. It was George Washington who in his farewell address advised the United States against the twin evils of excessive animosity and excessive attachment to particular nations. To me it sounds a little like the approach of non-alignment.

Speaking in 1958 Jawaharlal Nehru said: "All history points out that friends and allies sometimes become enemies, and enemies become friends, and the history of even the last twelve years has shown us this. Why then persist in a policy that perpetuates these enmities?" After pointing out that even the bloodiest of wars must come to an end and then the parties would have to seek peace, Nehru asked, "Why wait for a war before we seek peace?" The question is agonisingly pertinent today, because, for mankind a nuclear war will be a terrible, terminal war, and therefore we will have to seek peace before the war comes in order to avoid it.

Here we come to the question of disarmament, development and world peace. Man has today at his disposal the knowledge and the power to open up the cornucopia which would enable us to abolish hunger, and poverty, to raise the cultural levels of people everywhere, and to alleviate the thousand ills that afflict mankind, if only we eschew the massive misdirection of our resources and the misapplication of the fruits of science and technology. Even a limited agreement on disarmament by the great powers would release funds for development not only of the Third World countries but of people on the margins of poverty line in the advanced countries.

The confrontationist policies of the great powers have also played a part in the burden of armaments that is being imposed on the developing countries themselves. Eighty pert cent of the arms sales in the world today are estimated to be to countries in the Third World, most of whom can ill afford this diversion of their resources from developmental purposes. It may be asked, are not countries like India indulging in heavy expenditure on armaments? This is unfortunately true, but to a large extent it is the result of a vicious chain reaction set in by the cold war strategies of the super-powers in the region of the Third World, and by the policy of the advanced countries to sell arms for gaining political influence and for sheer profit.

Nevertheless I should like to point out that as far as India is concerned, while taking every precaution to possess adequate arms for our defence, we spent only 3.58 per cent of our GNP on defence which is well below the world average and below what is spent by our neighbours in Asia. The concentration of our resources and efforts is predominantly on social and economic development. I must add that our nuclear programme and our space programme are also dedicated to peaceful and constructive uses as shown not only by our solemn policy statements but our abstention from manufacturing atomic weapons having mastered in 1974 technical capability to explode a nuclear device. We believe that progress towards disarmament by the great powers would lessen the armament burden on the developing countries and release funds for accelerating the developmental process in the Third World. That would be a major contribution to national development as well as global inter-dependence and world peace.

This brings us directly to the other most important issue of our time, the problem of development of the Third World and the relationship between North and South. Abraham Lincoln at a critical period in the history of the United States told the American people that a house divided against itself cannot stand and a nation half-free and half-slave shall not endure. I should like to say that an inter-dependent world cannot endure, one-third rolling in affluence and two-thirds wallowing in poverty. It is really a misnomer to call the developing countries the Third World.

As Prime Minister Indira Gandhi once put it, there is only one world, and that is the one world in which we all live. The so-called Third World is an integral part of the same world. If one looks at it in this way, the North-South question can be seen as one of inter-dependence and cooperation rather than one of competition and confrontation. Indira Gandhi speaking for the developing countries said at the Cancun Summit: "We are not supplicants. Nor are we confrontationists. It is our experience that the interests of the developed and developing countries are so inter-twined that we can all survive in harmony only in conditions of true inter-dependence ... We earnestly seek a global compact which will ensure the development of the poorer countries along with the prosperity of the developed nations, in circumstances of international peace and security." Viewed in this light, there is no reason for the advanced nations to be afraid of global negotiations on the North-South question or of the efforts of the developing countries to work for collective self-reliance among themselves.

In February this year representatives of forty-four developing nations gathered together at New Delhi to consult with one another as to how they could cooperate among themselves and promote the North-South dialogue. Indira Gandhi set the tone

(Continued on page 32)

DISCUSSION

The perspective of Indian development is fast becoming a matter of crucial concern for the polity of the nation. Taking into account the need for serious discussion of the state of our political economy and the options before the country, *Mainstream* (March 20, 1982) published a contribution from a distinguished observer of the economic scene. This was followed by three thought-provoking contributions (*Mainstream*, April 10, April 24 and May 1). Here we publish two contributions — one from Dr. Boudhayan Chattopadhyay, Jawaharlal Nehru Fellow, and the other from Dr. Kripa Shankar, Research Associate, Govind Ballabh Pant Social Science Institute, Allahabad.— Editor

Indian Development: Another Viewpoint

BOUDHAYAN CHATTOPADHYAY

APROPOS the contribution by 'A Student of Political Economy' published in *Mainstream* (March 20, 1982), let me state first the points of agreement:

1. Methodologically, one agrees with the Gramscian characterisation of the Indian state and the dominant ruling circles as a moving and temporary coalition of interest groups subject to the compulsions of Indian nationalism and adult suffrage, which ensure a certain weightage to anti-imperialism and to populist pressures in the polity. Under the circumstances, the political system moves essentially through what Gramsci would call "war of manoeuvres" rather than of "positions" For instance, if the Congress party rules at the Centre, and certain Left parties rule in some States, objectively, from the point of view of the total dialectic of the Indian state as a whole, it is a coalition, sharing of power in a "war of manoeuvres" rather than of "positions", the histrionics on Centre-State financial relations notwithstanding. The sooner the Left came to terms frankly with this objective situation of sharing of power and responded to the corresponding obligations as a necessary corollary, the better. That would enable the Left to emerge as a serious national alternative competing for hegemony.

2. The Indian economy has adequate productive capacities and skills to face and tide over the current onslaught of international capital in deep recession, provided certain basic regulatory disciplines could be ensured and implemented all along the economy and polity. On the other hand, left to the mercies of "market forces", the spontaneous processes would lead to the development of some form of a Brazilian-South Korean "export dependent" model.

3. If the forces representing the rural and urban working classes and the broad middle strata in industry and the professions fail to mobilise and intervene on a national plane, the danger of some sort of a Brazilian-South Korean model materialising would threaten the very existence of a unified state and would, perhaps, also throw Indira Gandhi out of power. This is because of the inherent contradictions between the compulsions of Indira Gandhi's mass base in the specific geo-political context of our country and the compulsions of the Brazilian model.

One can also agree that the Left in India today does not respond adequately to the dangers ahead. The basic problem, however, lies elsewhere. I am afraid, the "economist" in the contributor has got the better of the "political" economist. Consequently, he tends to short-circuit what must be a long haul indeed.

Even if one granted the veracity of the inherent contradictions between the compulsions of Indira Gandhi's mass base in the specific geo-political context of our country and the compulsions of the Brazilian model, where are the political instruments to implement on the ground that measure of regulatory discipline which will stop the current drift of government policies to what the contributor rightly characterises as "neutrality? And, is there a willingness on the part of the top national leadership to permit these instruments to be forged and use them to purpose? In a poor country where the vast untapped labour reserves constitute the main resource, organisations of the labouring people, capable of directing concentrated configurations to specified tasks, constitute the essential pre-requisite for forging the necessary instruments for implementing a measure of regulatory discipline. A cadre-based mass political party — not merely an electoral machine — is the only centralising force which can forge these instruments and also keep the country united. Gandhiji taught us this in a different phase of our national struggle.

That instrument, the great Indian National Congress — an organisation the like of which the entire colonial world has hardly ever known — now lies in ruins. What we see before us today is an ugly caricature, a ghost. Who is to blame for this state of affairs? Is Indira Gandhi prepared to reforge this instrument? Or, does she really intend to operate through a system of personal power, a kind of Indian variant of Gaullism? Gaullism might have been a feasible proposition to an extent in a linguistically homogeneous, much smaller developed country, in the specific context of the French bureaucracy which has successfully operated the most viable public sector in the post-war capitalist world. But, one has only to contemplate the pathetic sight of the Chief Ministers in the Congress(I)-ruled states of this vast multi-lingual sub-continent to realise the absurdity of it all in the Indian context. What has happened to the Indian National Congress? Is she ready to reforge it? If so, how? She owes it to herself and to our recent and contemporary history to answer this supreme question. The way this answer emerges will determine her and the country's destiny decisively in the days to come.

Similarly, is the Left prepared, or even willing, to address itself to the painstaking gigantic task of creating those vast organisations of the labouring masses endowed with the capacity to *run* the economy and society at all levels, to *manage* and *direct* material and human resources to specific productive goals, and not merely to ask for a pay-rise here, or a tube-well, a school there, or for pushing party members of indifferent quality into various positions of power aud patronage? If that were so, the Left Front Government in Kerala would not have gone the way it did, despite the very timely warning by Achutha Menon in the pages of *Mainstream*; nor would the performance of the Left Front Ministry in West Bengal have left so much undone, although, it must be said, the latter has succeeded in providing some sense of security to the rural poor of West Bengal, while wholesale murder of Harijans and Muslims—Indira Gandhi's mass base — takes place in a number of Congress(I)-ruled States.

A scale of lumpenisation of Indian society, of the entire political system, has overtaken us. This is the moral-political overture to the impending lumpenisation of the "development process" also. That is how some Latin American economists have characterised the Latin American scene — the so-called Brazilian model included. It is primarily a challenge in the realm of consciousness that the national leadership — Left, Centre, or Left-of-Centre — must face to be able to overcome and stem the tide of this all-pervasive process of lumpenisation which is eating into the very marrow of Indian society and polity. All institutions, including the political parties, are afflicted. This is what Lenin would, perhaps, characterise as a "petty bourgeois wave" — the way he characterised the post-February situation in Russia, 1917 — fuelled by a global inflationary recession and domestic black money in the most sick and dangerous decade of this century, the eighties.

Lessons in the realm of consciousness are not learnt easily by nations and peoples — least of all through proposals for synthetic political alliances. The untenability of such synthetic political alliances is exemplified by the tragic experience of the CPI between 1969 and 1977. After all, the CPI did support Indira Gandhi on more or less the same premises as those advanced by a 'A Student of Political Economy' almost to the point of committing political suicide along with Indira Gandhi. Lessons have to be learnt, not merely in word but in deed, on both sides. It is going to be a long haul indeed, through blood and death, unless the various segments of the national leadership wake up to the supreme challenge in the realm of consciousness.☐

Development and the Left

KRIPA SHANKAR

THE Student of Political Economy (*Mainstream*, March 20, 1982) bases his thesis on the hypothesis that Indira Gandhi represents a coalition of forces that is anti-monopoly and anti-big-landlord. The argument that he advances in favour of his thesis is that as Indira Gandhi gets her support from the masses who feel that "she alone can deliver the goods", and as siding with monopoly and big land-

as a countervailing power will be to extend the public sector along with strengthening the small and medium entrepreneurs in the industrial field and medium and small farmers in the agricultural sector respectively.

If the Student of Political Economy could prove that by her policies Indira Gandhi is trying to build a public sector which has the her policies strengthen these elements or do they go to undermine their position? An objective analysis of the policies followed by her should enable one to determine her role instead of prejudging the issue subjectively and then trying to build arguments in support of such judgement.

Let us begin with the public sector. The Student of Political Economy will concede that having public sector units in some key sectors, particularly where the private sector has neither the capacity nor the willingness to operate, will not by itself lead to the curbing of monopoly elements. The experience in our country and elsewhere is that unless the public sector assumes commanding heights and controls the direction of the economy, it may only play second fiddle. The public sector in India was confined to building infrastructure and certain heavy industries where the private sector was incapable of entering the field. Creation of power, steel, irrigation, communication, etc., is the necessary condition for industrial and agricultural growth of any country. It does not conflict with the interest of monopolist classes as it is only when critical inputs are available that they can hope to grow and expand. The private industrial sector has made rapid strides, and it is doubtful if it could have done so in the absence of huge investments made by the public sector in infrastructure and in heavy industries.

The entry of the public sector in heavy industries should not be construed as an encroachment as, by and large, the Indian private sector was so timid and circumscribed that if could not invest in heavy industries where investment requirements are staggering. No doubt public sector investments have gone up, but even faster has been the growth of the monopoly sector. This has been well documented in several studies and the Student of Political Economy will be fully aware of this. The Licensing Policy Enquiry Committee estimated the assets of the top 20 business houses in tne country at Rs 2089 crores in 1966-67. During the first decade when Indira Gandhi was at the helm of affairs the same had increased to Rs 5110 crores by 1977. The assets of the top 20 business houses which formed 61 per cent of the paid-up capital of all joint stock companies in the country in 1966-67 rose to 68 per cent in 1972-73. The growth of large houses has gone on unabated. The assets of two biggest houses — Tatas and Birlas — was Rs 968 crores in 1966-67; by 1978 their assets had increased to Rs 2741 crores.

The public sector in India was not extended to other manufacturing sectors where the private sector had undisturbed sway. The fixed capital of the factory sector increased from Rs 5,855 crores in 1966-67 to Rs 17,171 crores in 1976-77. The distribution field was scrupulously avoided, and even the marketing of public sector industries goods was monopolised by a few private companies. Four private companies control more than half of the distribution of the public sector steel industry. The gross profit of large public companies whose figures are published by the Reserve Bank of India increased by three times between 1965-66 and 1976-77. The total income of 1702 such private sector companies in 1976-77 was Rs 14,990 crores. The income of the Government of India on revenue account in that year was only five and a half times that of the income of the above companies.

Land reforms occupy an important place in the modernisation process. Late-comers in the industrial scene have to accomplish this in a swift manner as the time-span that was available to developed countries is not available to them. Japan completed the process of land reforms in the early fifties when nearly one-third of the land was transferred to the working peasantry. In India, although the western type of feudalism was transplanted by the British, yet the Government was relutcant to change the agrarian relations. The slogan of land to the tiller was, by and large, not implemented, and concentration of land ownership was not disturbed. The ceiling laws that were enacted fixed the ceiling quite high and there were so many exemptions and loopholes that the actual land redistributed does not form even 0.3 per cent of the cultivated land, although roughly one-fourth (23 per cent) of the total area is held in holdings of above 25 acres. The pattern of land ownership continues to be highly idequitous and the top 1 per cent own 10 per cent of the land whereas one fifth of the rural population consists of agricultural labourers having no or little land.

The pattern of asset ownership in the rural areas as revealed by the Reserve Bank Survey indicates that the poorest 10 per cent owned 0.1 per cent of the assets whereas the top 10 per cent owned half of the assets in 1971-72. The picture was similar to what it was in 1961-62 when the previous survey was conducted. In fact the concentration ratio of rural assets which was 0.65 in 1961-62 increased further, though slightly, to 0.66 in 1971-72. The position in the rural areas is that the assets owned by the top 1 per cent are equal to the assets held by bottom 50 per cent of households. If the pattern of ownership of land and other assets continues to be so inequitable the gains of development are bound to accrue to the better placed groups — the higher in the hierarchy of asset and land ownership the greater the gain. In such a situation those with little or no assets are bound to be left in the lurch. Can it be imagined that the landless, the marginal and small farmers who constitute about 90 per cent of the rural population can share the gains of development if the top 10 per cent continue to hold more than half of the land and other assets?

The Student of Political Economy wants us to believe that Indira Gandhi can perform the miracle of strengthening the position of the landless and the small farmers without breaking the concentration of land ownership. If the top groups in rural and urban areas continue to consolidate their position by virtue of ownership of assets, how can they acquiesce in the implementation of policies aimed at curbing their power and strengthening the position of the poorer sections?

During Emergency, when Indira Gandhi assumed draconian powers, she did not move in the direction of breaking the concentration of wealth. The Twenty-point Programme did not envisage either lowering the ceiling on land or breaking the monopolies. The richer classes in India having acquired huge wealth through questionable means are wasting the same in vulgar consumption. Even a bourgeois Government would very much like, in a different context, to curb such wasteful consumption and mop up the surplus for making productive investments in the economy. There is no other way to "Garibi Hatao". But Indira Gandhi has long given up this slogan which was once used to beat back her rivals. When she staged a come-back to power in 1980 she did not advance this slogan and instead promised a "Government that works".

And how is that Government working? Every year 5 million persons are being added to those who live below the poverty line. Not only resources are not being mopped up from the affluent classes but resources mobilised mainly by hitting the common man are being largely used in a non-productive manner. Non-developmental expenditure of the Central and State Gavernments is increasing in a phenomenal manner. During the five years ending 1981-82 the non-development expenditure of these Governments increased from Rs. 8,062 crores to Rs 14,016 crores. Now it is increasing annually by more than Rs 1,000 crores. Expenditure under-developmental heads is also establishment-oriented, with the result that very little of it goes to improving the productive base. At present the total annual spending of the Central and State Governments is of the order of Rs. 40,000 crores or nearly Rs. 600 on a per capita basis. Why is this huge spending not reflected in higher availability of daily necessities and an easier life for the people? It is precisely the unproductive nature of this spending which has resulted in near-stagnation in the living standards of the bulk of the population and has created an inflationary situation.

The Government is not only not making any change in the structure of property ownership but is not even inclined to check the wasteful consumption of the propertied classes despite Gandhian pretensions. This cannot but result in a very unsatisfactory growth rate creating only enclaves of prospertiy surrounded by a sea of misery.

Can the Left support such a Government and yet remain loyal to its cause? Let the Student of Political Economy ponder over this.☐

CASE STUDY

Dairy Development in a Backward Village

KUNWAR PRASUN and BHARAT DOGRA

RAMPUR village is located on Tehri Rishikesh road in the Tehri Garhwal district of Uttar Pradesh. It is a typical hill village. Both the important traditional occupations — agriculture and animal husbandry — are characterised by low productivity and absence of organised efforts to increase productivity. In addition, the villagers are facing increasing problems in meeting some of their basic necessities like fuel and drinking water. Due to the deteriorating living and occupational conditions several families have been forced to send out at least one adult male to cities in the plains to earn some money — mostly in low-paid jobs — to sustain the family in the village. Thus, while the cash income of some families may have increased significantly, it has to be seen in the context of the deteriorating state of traditional means of livelihood.

An important objective of planning for such villages is to turn them into relatively self-reliant units from the present-day 'money-order economy' so that the young men can hope to sustain their families without having to migrate to far-away places in search of jobs. The potential for agricultural development is certainly there, but it is limited by scarcity of cultivable land and the problems in cultivating the relatively steeper slopes. Animal husbandry, despite present-day low productivity, has a higher potential and can play an important role in reducing the village's dependence on money orders. Increase in milk production can raise the nutritional standards of the villagers as well as increase their earnings by supplying milk to cities like Tehri, Rishikesh and Dehradun. Here is a village where dairying, though under-developed, has the potential of playing an important role in improving the plight of poor rural families with small land holdings.

A total of 378 men, women and children from 57 families live in Rampur village which is about half an hour's climb from the motor road, almost halfway between the well-known towns of Rishikesh and Tehri. Due to low returns from agriculture and animal husbandry, as many as 68 per cent of the families have one or more migrant members. Families from which no member has been able to go out to work have an average monthly income of Rs. 131. On the other hand, the average monthly income of families which have one or more migrant members is as high as Rs. 775. Thus the entire village can be divided into two sections — those having a regular inflow of money orders who can lead a life of certainty as far as their problem of food is concerned though they also have to bring fuel and fodder from distant places, apart from leading an uprooted family life, and those who do not get cash remittances from outside and for whom getting two square meals a day is a never-ending struggle.

As in all hill villages, agricultural land is in short supply and generally no one owns more than 4 or 5 bighas. The total number of animals is 164, including cows, buffaloes, bullocks and goats. Of these 38 yield milk and the remaining do not. Eighty-eight per cent of the families participate in animal husbandry activities to a lesser or greater extent. On the one hand there are people like Abbal Singh, Raghu Vir Singh, Man Singh and Kalam Singh who are able to get 4 litres of milk a day and on the other there are villagers like Kuttu, Gadori Devi, Gyan Singh and Devi who have to be content with no more than 0.2 litre a day. The total production of milk on an average day is about 72 litres, the average per-family production being a little around 1.2 litre per family or 0.5 litre per capita. Families getting the highest milk production have an average income of Rs 1362 per month and those having the lowest production of milk have an average income of only Rs. 242 a month. Nearly 30 per cent of the families do not have any milk production of their own (they are not necessarily the poorest — lack of availability of family labour, among other things, may lead to inability to keep milch cattle).

The families having a low production of milk (less than half a litre) generally use milk only for tea and occasionally for the children. In other homes where milk production is higher, milk is used for direct consumption, for making tea, and in addition for making ghee. One or two families even sell their surplus milk to roadside tea stalls. Nearly 58 per cent of the families use milk to a lesser or greater extent for making ghee. Regarding the 30 per cent of the families with no milk production, 5 per cent use milk powder, about 9 per cent purchase milk from other families within the village and 16 per cent obtain milk from other families when their requirement is of an urgent nature.

In Rampur village there are 78 children below 10 years of age, of whom 5 per cent have gone out with their parents, nearly 78 per cent manage to get some milk to drink, while 17 per cent get almost no milk. Some parents said that as buffalo milk is difficult to digest in the case of children below the age of two, they prefer to give them tea instead.

An interesting aspect of milk production in this village is that according to a large number of villagers dairying has not been developing but deteriorating over the years and that milk production used to be higher earlier. In fact as many as 48 per cent of the families said they were able to obtain one and a half to two times the quantity of milk that they now obtain till a decade ago, while 44 per cent said their position regarding milk production had not shown much change.

As for the deteriorating state of dairying activities, the villagers mention several reasons, one of which is deforestation and deterioration of community grazing lands over the years due to which the availability of fodder has emerged as a critical constraint on dairy development. The lack of availability of family labour for looking after a large number of cattle is another constraint. Adult males have migrated from several families and the women have to do not only all the household work but in addition work in the fields and fetch fuel and fodder from distant places. Health problems and social problems regarding the break-up of the joint family or other problems within a joint family were also mentioned as reasons for inability to give more attention to dairying.

On the other hand, there are several families which can keep more cattle and in fact are anxious to do so but are unable to purchase a cow or buffalo because of their limited purchasing power and the high and increasing price of milch cattle. Last year Abban Singh (monthly income Rs 2100) purchased a buffalo for Rs 2100 while Kalam Singh (monthly income Rs. 1400) purchased a buffalo for Rs 2300. In contrast a person like Kuttu (monthly income Rs 50) cannot even think of buying a buffalo at this price. However he is now able to get a milk production of about one-fifth of a litre by painstakingly rearing a female calf. Of the people owning milch animals, nearly 21 per cent were able to buy a new cow or buffalo last year while nearly 28 per cent are obtaining milk from milch animals purchased earlier. The remaining families are getting their supply from female calves raised in their homes.

The maximum yield obtained in Rampur from a buffalo is 4 litres of milk a day. However, as many as 38 per cent of the buffaloes give a milk yield of between 1 and 2 litres while 18 per cent yield less than half a litre. Low availability of fodder and the absence of efforts to improve cattle breed are responsible for this low yield. Moreover, there is almost complete absence of veterinary care. Although a veterinary hospital does exist about 11 km from Rampur at Fakot, it is not functioning efficiently and hardly makes any effort to spread information regarding veterinary care in the neighbouring villages. Most villagers of Rampur are not even aware of the existence of this hospital. Similarly, there is no sign of any activity of the animal husbandry department. As a village youth Vir Bhadra quipped, "Hardly anyone here has ever heard about the animal husbandry department".

However, the biggest constraint is the limited availability of fodder. Bhimal and Guriyal trees standing on the bunds of agricultural fields provide a nutritious source of fodder for the cattle, but at present these trees are able to meet only 50 per cent of the fodder requirements, and that too only during winter months. Till some years back there was good forest cover at a distance of about 1 km from the village in Bokhart, Dugadda and Biasalyan, but most of the forests have now vanished. These forests had Khair trees which provided good quality fodder. Nowadays the women of Rampur have to traverse nearly 10 km to get fodder from the forests of Salet and Kalipair. These forests now have to meet the requirements of several villages and so they are fast dwindling. As village women have to climb very steep slopes to get this precious commodity they occasionally fall down getting seriously injured or even die. The forestry department had decided to axe the trees at Salet for commercial use of timber but activists of the Chipko ('Hug the Trees') movement organised by the village women prevented this. The women and even children of Rampur village participated in this movement, Some went to jail for a fortnight. Fortunately the forest was saved from the axe of the contractors.

Thus, despite the low productivity of the milch animals, the villagers have to work extremely hard to obtain fodder for their sustenance. The death of a buffalo generally means a family going without milk for five years and if a bullock dies, it means ploughing their land by borrowing bullocks from others. An additional reason why animals, even dry ones are valued is the organic manure obtained from them. In the absence of this manure hill agriculture will suffer greatly as it will become even more difficult to get something out of this infertile land, a good part of which is not really suitable for agriculture. Thus, despite the poor state of animal husbandary, animals nevertheless meet important needs of milk, manure and draft power which are critical for this village community.

Thus development of animal husbandry is important not only from the point of view of dairy development but also from the point of view of agriculture, and both these requirements should be considered while planning for animal husbandry for this region. While cattle improvement and veterinary care are certainly important, the most basic need that has to be met is that of adequate fodder. The deforestation and environmental degradation in this area has led to landslides and floods not only in this area but also in the plains below. The need for large-scale afforestation work in the Himalayas is widely recognised now and is being pursued. This should be inter-linked with the animal husbandry programmes and trees which provide nutritious fodder should be grown on whatever vacant land is available in and around the village. The villagers should be mobilised for this task. Experiments in handing over small stretches of afforested land to individual families for their care and allowing them to take fodder from it on a self-sustaining basis have been tried elsewhere in these hills and can be repeated here. Once adequate fodder becomes available in and around the village, cattle development programmes should be linked to the availability of fodder. In other words, the improved cattle should be able to convert this fodder efficiently, rather than require purchased feed for efficient milk production and good health.

Unfortunately the only animal husbandry development work which seems to have been tried out in this region in recent years (not in Rampur but in nearby villages) is the purchase of cows and buffaloes from the breeding tracts of Haryana and making them available to the hill villagers partly on loan basis and partly on grant basis. In this work too there have been irregularities. In some cases the beneficiary had to spend too much on appeasing the concerned officials in several ways. In some ways the cow or the buffalo purchased was of poor quality. In some cases corruption also involved local farmers whose cows were passed off as cows purchased from Haryana and the money was shared with the officials, while in some cases the 'beneficiary' suffered a loss because he was forced to accept a poor quality cow or buffalo which died soon, saddling him with the burden of repaying the loan.☐

Farm Prices : A Rational Approach

M.V. NADKARNI

THE problem of agricultural prices is often presented as if it is a see-saw game between peasants and workers (both urban and rural). That is, it is supposed to be a situation where any loss to peasants is a gain to the working class and vice versa. Putting it this way may appear so simplistic that it would immediately provoke disclaimers. And yet, this is in essence the stand taken by quite a few. When disparity in land holdings and market dependence for food on the part of not only agricultural labour but even of the small farmers are taken into account, the contradiction between the interests of farmers who have surplus to sell and of those who have to buy it could naturally appear as quite sharp. My purpose is to point out that this contradiction is more apparent than real or basic, and that the real contradiction is located elsewhere.

Commercialisation of agricultural production is concomitant with economic development. In the interest of both further growth and ensuring basic needs to the people at large, agricultural and industrial production must grow and there should be an increasing flow of marketable surplus from agriculture consisting of both food and raw material. But how does one draw a farmer into the market and induce him to sell? By assuring him at least a return which is sufficient not only to meet the cost incurred on current inputs and maintenance of capital but also to provide him the surplus needed to keep him and his family in good health and reasonable comfort. Prices of agricultural commodities relative to the prices of inputs are an important element determining this return. (This does not mean that marketed surplus necessarily responds to any price variations. Above a certain minimum price which provides a reasonable return and draws them into market, farmers may respond to increase in relative prices, of one commodity as against another, but not necessarily to a general rise in the price of agricultural commodities). Another important element is productivity, which is determined by technology, skills and condition of land and capital. Forced commercialisation under conditions of bondage does not go a long way, since it does not ensure agricultural development and therefore economic development in general. Commercialisation is in the interest of both farmers and the working class when it provides adequate return to the former and marketable surplus to the latter.

But this is not simply a 'boy-meets-girl' story, for there is invariably a broker in commercialisation, and his nature determines the nature and magnitude of the contradiction. This broker is not simply the trader as a person, but the whole institutional set-up through which agricultural commodities are traded. The basic contradiction is not between the boy and the girl, but between the broker on the one hand and the 'couple' on the other

For quite some time, it was believed that Indian agricultural marketing is competitive and efficient and trading margins are no more than what is needed to meet the costs of transport, storage and interest on capital invested. With the help of mere co-efficients of correlation applied to inadequate data, it was sought to establish that markets are integrated with each other and, therefore, competitive. Recent researches by Barbara Harriss among others – painstaking and thorough — have called the bluff. She has proved on the basis of her studies in Tamilnadu that agricultural marketing is far from being competitive, that there is a good deal of concentration of trading turnover in a few hands (much more than what exists in land distribution), and that trading is so profitable that profits made are invested again in trading rather than in socially more productive economic activities. To anyone who kept his eyes open to the way traders have acquired urban and rural property, the certificate of 'competitive', 'fair', and 'efficient' marketing given by even 'serious' economists would have looked surprising. Now we have documented proof provided by Barbara Harriss.

One might say that only a few traders make huge profits and that the whole trading community is not engaged in profiteering. But that is precisely the nature of the system. Petty traders who form the bulk have no control over the system. It is the few monopoly traders who control it and shape its course and consequences for farmers and working class alike. Harriss has shown that neither regulation of markets nor state trading has solved the problem. (See *Transitional Trade and Rural Development*, 1981 and *State and Market*, Report to Overseas Development Administration, UK, Mimeo, 1981. Also see Suman Sarkar's paper in *EPW*, September 26, 1981; she found traders indulging in discriminatory practices particularly against poor farmers, apart from finding agricultural marketing to be far from competitive in general).

The problem is not merely one of increasing farmers' share in the rupee paid by the consumer and reducing trade margins to their proper size. In a so-called free market set-up, fluctuations in prices and uncertainty caused thereby pose even more of a problem than the level of average prices. Though minimum or floor prices can be assured, this does not stop significant fluctuations above the floor, assuming that the benefits of price guarantee reach all farmers seeking it. The behaviour of cotton prices is a case in point. They registered a sharp rise in 1976-77, inducing many farmers to divert land to cotton cultivation. There was a sharp fall the very next year, upsetting the calculations of

The author is Professor, Institute for Social and Economic Change, Bangalore.

such farmers. The susceptibility of commercialised agriculure to cobweb-type cycles is a well-known phenomenon has long become part of text-books.

What is missed here is that this is basically a problem of instability and uncertainty in prices rather than simply one of ensuring a minimum reasonable price. Even if a floor price is fixed and is regarded as reasonable to start with, once it rises sharply and returns almost to the floor level later, the floor price would look now unreasonably low. And this is so for understandable reasons. Whereas prices of manufactured goods adjust to upward rise in the prices of agricultural raw material, they do not similarly adjust to downward movements in the latter. Such a ratchet effect is particularly noticeable in manufactured goods. This is what happened in the case of cotton textiles, whose prices have been increasing continuously in the last six years in spite of a crash in cotton prices.

Meanwhile, prices of agricultural inputs too — which form a part of manufactured goods — have increased, leading to an understandable demand to raise the floor prices (in effect, procurement prices) of agricultural commodities. Though there is an inflationary trend in both agricultural and non-agricultural prices, fluctuations around this trend are more in evidence in the case of agricultural prices. This makes any rational decision-making in agriculture a much more difficult task, which could either retard commercialisation itself or lead to agitations to raise farm prices and incomes and even to waive repayment of crop loans and electricity charges. The demand to waive the latter is certainly unreasonable and goes against the farmers' own long-term interests; but this is nevertheless understandable in the context of endemic insecurity in commercialised agriculture even in pockets privileged to have assured water supply. Barbara Harriss has also interpreted the recent agitations by farmers as being on account of their concern to assure *security* for their gains in incomes in irrigated areas.

It is interesting to observe that the wholesale price index numbers increased during 1970-71 to 1980-81 at the rate of 5.9 per cent per annum in the case of fibres, but they increased the rate of 7.2 per cent p.a. in the case of textiles — a manufactured product. Using the co-efficient of variation around trend (CVT) as a meaure of fluctuations around this inflationary trend, we found that it was as high as 11.6 per cent during the same period in the case of fibres as against only 5.4 per cent in the case of textiles. Whereas the trend of rise in prices was higher in the case of manufactured product, fluctuations were higher in the case of prices of raw material used. The difference in the case of oilseeds (agricultural raw material) and edible oils (manufactured) was not so sharp. The trend rates of increase in wholesale prices in their case were respectively 7.5 and 7.7 per cent p.a., and the CVTs 15.1 and 13.8 respectively Fluctuations were wider in the case of oilseeds than in edible oils, but the difference was less than in the earlier case. Taking foodgrains, the CVT during the same period amounted to 12.8 per cent, whereas in the case of the general price level (all commodities) it was lower — 8.3 per cent. The average rate of increase in the wholesale price index of foodgrains was 6.3 per cent p.a. but higher at 8.4 per cent p.a. in the case of general price index.

An idea of ups and downs in prices nearer to the farm level during five recent years can be had from Table 1. We may note that traditional commercial crops like cotton and groundnut grown in drought-prone areas have suffered much more instability than the less commercialised food crops. This is not accidental and reveals how commercialisation affects agriculture.

Table 1: Farm Harvest Prices (Rs. per quintal, rounded off to nearest rupee).

Source: Agricultural Situation in India (various issues), and Bureau of Economics & Statistics, Karnataka.

The question whether the trend in agricultural prices has turned unfavourable relative to the prices paid by farmers for inputs and consumer goods is controversial and falls outside the focus of this article. We may, however, discuss it briefly insofar as it is related to our focus. There is no evidence of a long-term trend having turned unfavourable, particularly if we take the whole period since the fifties or sixties. During the seventies, however, a few years witnessed a decline in prices received by farmers relative to prices paid, though not each time in absolute terms. Whether the trend over the decade as a whole turned unfavourable or not depends on statistical or measurement factors like the base year selected, commodities and inputs selected, weights assigned to them, level of prices taken (farm harvest prices or wholesale prices, etc.) and so on.

We have an interesting attempt in this respect by M.S. Bhatia presented at the Annual Conference of the Indian Society of Agricultural Economics in December 1981. The paper showed that all crops were not alike and there were diverse patterns. Taking all crops together, prices received by farmers were on an average lower during the latter half of the seventies, relative to input prices. This was on account of a sharp rise in input prices during 1974-75 and 1975-76, which depressed relative prices of agricultural commodities so much that even subsequent relative gains did not enable them to recover the pre-1974 position. However, gross income from agriculture maintained its parity with input prices, thanks to increasing trend in production over the decade. The crux of the situation, whatever be the conceptual and statistical framework used to grasp it, is that fluctuations in the series were always more marked or striking than the trend itself. At disaggregated levels, it is bound to be much more so and it is at these levels — rather than at the national level — that the shoe pinches most. The national measure is after all an average and conceals most of the fluctuations at the local level directly affecting farming. This is so particularly in respect of farm prices. The insecurity and uncertainty is so serious that it could well obscure the overall trends in incomes of farmers, both as a matter of fact and psychologically, though unfortunately the problem is not often perceived as such in clear terms.

One more point needs to be clarified. There is indeed instability in both prices and production. It would seem that in periods of crop failures, prices rise enough to compensate for the decline in output, and that decline in prices occurs only during years of bumper crops so that incomes may be stable though prices and production need not be so. Accepting this logic amounts to applying what holds good at aggregated or economy level to micro or local levels. Even if there is no general decline in output at the level of the economy, there may be drought in several regions and, therefore, decline in output in such regions may not be accompanied by corresponding increase in prices. Even if there is a general decline in output, it is vital to the country to arrest a rise in prices and imports may be made. Similarly, there may be a crash in prices following a general increase in output, and the latter may not be experienced by all regions though the former would be. Price movements also are more often than not disproportionate to movements in availability and may partly be a result of speculative deals and international influences. Price movements need not also be symmetrical through the hierarchy of price regimes. The full benefit of a price rise may not be passed down the line to the farmers, but the impact of price fall may be passed on more than proportionately to the movements at wholesale level.

In a recent study of instability in Karnataka agriculture, an attempt was made, *inter alia*, to Compare instability in money value per hectare (that is, yield per hectare valued at current farm harvest prices) of 11 crops with instability in physical yields. If there would have been a compensating or stabilising effect on money value of crops due to diverse directions of price and yield movements, the instability in money value would have been less than in physical yield. Our finding, however, was otherwise, as can be seen from Table 2. The fluctuations as measured by the coefficient of variation around trend, were always higher in the case of money value than in physical yield per hectare. Except in the case of maize, wheat, ragi and tur, the CVT in money value was *more than twice* as high as in physical yield. Even in the case of the former four crops, the difference was significant. It is evident, therefore, that farmers suffer from both unstable prices and unstable yields and that they do not counterbalance each other. At more disaggregated district levels, this would be even more so.

Table 2: Instability in physical yields vis-a-vis instability in money value of yields at current farm harvest prices (in Karnataka, State level).

Crops (in descending order of CVT in physical yield)	*Co-efficient of Variation around Trend (%)*	
	Physical yield	*Money value*
Maize	39.1	55.8
Wheat	29.4	56.2
Cotton	26.3	80.1
Ragi	25.4	31.1
Gram	22.4	46.0
Bajra	21.3	44.0
Tur	17.4	32.1
Jowar (total)	14.6	40.9
Groundnut	14.6	32.6
Rice	11.7	29.8
Sugarcane	9.1	28.8

Note: The calculations are based on the data from 1955-56 to 1975-76.

Farmers, therefore, would do well to perceive more precisely the nature of problems affecting them. If instability in agricultural markets is minimised through a revolutionary change in marketing and distribution systems and measures are taken towards combining growth with stability in yields, this would be entirely in the interest of both farmers and the urban working class. Such a situation would facilitate a more rational planning of crop production and capital formation on the part of farmers, and would also control the inflationary process. If, on the other hand, demands are made simply to continuously raise agricultural prices, farmers would only be playing into the hands of the common exploiters of the farmers and the urban working class. The benefits of such increase in agricultural prices would hardly reach the farmers and would get eroded even before they reach them. The existing system would ensure this, and the inflationary process would be fed continuously. This is beneficial neither to the farmers nor to the working class — urban and rural.

Farmers, the working class, political leaders and social scientists will have to deliberate on the alternatives to the present marketing system and ways of achieving them. In doing so, they may soon find that a change in agricultural market system cannot be isolated from the problem of changing the nature of market and production relations in manufactured goods too.☐

Lessons from Anti-HPT Drive

VIMAL BALASUBRAHMANYAN

ACCORDING to a report published in *The Hindu* on March 5 this year, the Union Health minister, B. Shankaranand, told the Lok Sabha that the Government had taken a conscious decision to permit the manufacture and use of five drugs banned in some countries. The criteria on which the decision was based were 'the relevant needs of medical care' and 'technical advice'. Of the five drugs one was the drug for hormonal pregnancy testing (HPT) which, the Minister said, had been permitted to be marketed subject to a 'cautionary' statement being added to the label.

As far as HPT is concerned, neither the two criteria nor the stipulated 'caution' in its current form can stand up to scrutiny (*Mainstream*, April 10, 1982). It is hard to see what kind of 'technical advice' regarding medical care' could justify a test that is neither accurate nor indispensable. And if it is being permitted for uses other than pregnancy testing, what is the Government doing to ensure that its misuse is prohibited and penalised? (More on this aspect later.) As for cautionary statements, does the Health Minister think that women taking HPT carry magnifying glasses in their handbags to read the small print on the packets?

It is ironical to recall here that in 1979, a reputed Calcutta gynaecologist had urged 'professional medical bodies' to 'agitate' so that the Government of India would actually promulgate an ordinance (i) banning the use of these hormonal drugs for pregnancy testing, 'particularly so in this the International Year of the Child.' (Of all the unrealistic suggestions to make!) The Government of India is perhaps so preoccupied with preventing babies from being born that it cannot really bother about those whose births it has not succeeded in preventing.

It is quite clear from the Government's callous attitude that a powerful drugs lobby is at work. The drug companies give information on drugs to doctors and doctors 'advise' the Government. As long as this mutually beneficial linkage remains strong, research findings that go against drug company interests will be confined to the academic journals instead of being adapted for public benefit. WHO has pointed out: "Drug advertising and contacts with representatives of pharmaceutical firms are often the main sources of information for a physician on drugs and sometimes the only ones. Such information is always influenced by commercial interest. The basic theme of promotional material is that a drug will provide the answer to distressing clinical problem. Little attention is given to aiding the physician to use his clinical judgement. Unfavourable aspects and complications of such treatment rarely receive sufficient attention." Everyone knows this now. The point is hammered home at every seminar on drugs, doctors themselves admit it, but life goes on unchanged. There's nothing like the good old status quo.

Coming back to the current anti-HPT drive, information emerging from medical sources is revealing, and encouraging too. First of all, it is good to know that a section of the medical profession, however minuscule it may be, is seriously concerned about HPT misuse. The doctors have focussed on the issue in English and Marathi newspapers published in Delhi, Bombay and Bangalore and also in district newspapers in Maharashtra. Leaf-lets listing the dangers of HPT have been distributed at women's rallies in Delhi, Bombay and Pune. In Delhi the Voluntary Health Association of India (VHAI) is collecting signatures from doctors to press anti-HPT demands. It is reported that: the test is prescribed in both rural and urban areas and often those who get it are poor women; a large number of doctors are not aware of the side effects; in Pune, many women are being sold this drug as an abortifacient.

In a letter to the Drug Controller, VHAI has demanded among other things: (1) a clear, bold warning on the packets in both English *and the regional languages*; (2) all practising medical professionals should be *individually* informed of the statutory warning through official letters and the mass media. (A prominent DAVP ad on HPT risk is clearly called for; (3) information should be given to the public on how all drugs are tested, on whom, and what side effects they have.

The relevance of this last point extends much beyond the anti-HPT drive, especially because of the invidious dumping in the Third World of all kinds of drugs that are no longer considered safe in the affluent countries. Public awareness on these and related aspects could also be a protective step against 'safety testing' of drugs on Third World populations aimed at bypassing the stringent norms for human experimentation that have been set up over the years in the West.

In Delhi, investigations carried out by VHAI along with a women's group, 'Saheli', revealed that *many doctors prescribe the drug without the warning.* It is bad enough prescribing an unreliable and unnecessary test. To do so without informing the patient of the risks seems not merely unethical but criminal. Would the Medical Council of India care to come out with a strong indictment of such practice and declare that ignorant and indifferent doctors should be struck off the register? (In the previous *Mainstream* article it was shown how some doctors continue to prescribe the drug but 'protect' themselves by warning the patient and advising termination of pregnancy).

Some pertinent points thrown up in the anti-HPT drive assume added importance in the context of the misuse of a large number of other drugs. Since the prescribers' guides (CIMS and MIMS) have included the contra-indications for HPT only in recent issues, the question is: "Do not drug companies supplying the preparations to chemists and doctors have the responsibility of categorically warning them of this change"? When new findings about a drug's adverse effects emerge, whose responsibility is it to ensure that *unbiased* information is given to doctor, chemist and consumer? Literally, whose baby is this? VHAI points out: "It is the role of women's groups, consumer associations and socially conscious individuals to disseminate and share relevant information. *If the health personnel could have done this, so many problems would not have existed in the first place*". (Emphasis added)

Referring to the ploy adopted by some companies which write 'see literature' in the prescribers' guides, two VHAI doctors say: "Even on specifically asking for the 'literature' we were told that the 'literature' is given only to the prescribing doctors". The drug companies know fully well that the products are available for the asking and can be, and are being, bought easily over the counter. A strange case where a dangerous drug is 'fit' for the lay person's consumption but the 'literature' listing its dangers is not!

And finally, a tailpiece which is basically a sidelight on the HPT issue but which nicely sums up its irony.

First some facts: Sweden was the first country to ban the drug in 1970, followed by Finland (1971), USA and Singapore (1975), Belgium (1977) and UK (1978). The drug was banned because of 'insufficient evidence of effectiveness'. However, as things stand, in India the drug can at the most be banned for pregnancy testing and not fully withdrawn because the Indian Council of Medical Research and the Institute of Obstetrics and Gynaecology have recommended its use in secondary amennorhoea after excluding pregnancy.

Now the irony: Condemning HPT misuse, Dr. A.R. Phadke writes: "There is one situation where the preparation is useful: that is to restart menstruation in women who have stopped menstruating (secondary amenorrhoea) but are not pregnant. Ironically, doctors almost invariably opt for curetting rather than use this preparation when really indicated".

Curetting, let's not forget, means a good day's earning for the doctor concerned. So why prescribe a pill that is cheap and harmless (since no foetus is involved)? The wheel has come full circle.☐

PHYSICIAN, TEACH THYSELF

A short report in a 1976 issue of the American magazine, *Science*, shows how the current Indian drama was enacted less than a decade ago in the USA. All the parallels are there — with one small, semantic difference. Apart from wrongful use in pregnancy testing, the combination-hormone drug was being wrongfully prescribed for preventing miscarriage, while in India it is being wrongfully advocated as an abortifacient. Some wonder drug!

The report, under the heading "Irrational Drug Prescribing and Birth Defects," begins by saying: "One of the weakest links in the chain connecting the drug company to the consumer is the physician. Few Physicians receive formal training in the current use of drugs, but the average practitioner writes 7,934 prescriptions each year. Many of these prescriptions are irrational in the sense that the drug had not been shown to be effective for the purpose for which it has been prescribed; many are completely inappropriate because they represent a substantial hazard to the patient without any compensating benefits."

As a "current" example of the second situation, the magazine cites a numbers of facts regarding the misuse of the hormone-combination drug for pregnancy testing and prevention of miscarriage. The gist is: Physicians have continued to prescribe the drug for use during pregnancy despite evidence that it may produce birth defects. Research studies at the University of Colorado Medical Centre and the New York State Department of Health are quoted, describing the nature of the deformities which include limb reduction, missing toes and fingers, and congenital heart defects.

In early 1975, FDA had warned against use of the drugs during pregnancy, in a bulletin mailed to physicians and other health professionals. The warning was apparently ignored. A survey showed that the number of prescriptions for hormone drugs in early pregnancy had declined very slightly compared to the number in 1972 when such uses had been approved. "Prodded" by the Public Citizen Health Research Group in Washington, FDA announced in October 1976 that it would issue fresh rules which would require manufacturers to print and distribute to users a brochure emphasising that the drug should never be used during pregnancy. The new rules would also require manufacturers to incorporate in the labels of the products a warning against use in early pregnancy, to say that no studies show the drug to be effective in preventing miscarriage, and to say that the drug should never be used to test for pregnancy. "The regulations would thus not only discourage the physician from prescribing the drug but would also warn the patient, so that even if the drug should be prescribed, she will be alerted to the potential hazard and will thus retain the option to avoid the drug."

— *V.B.*

Islam and Polity: Contradictions in Pakistan

ASGHAR ALI ENGINEER

At the outset it must be stated that the Koran—the primary source of all Islamic legislation—does not give any concept of Islamic state; it gives the concept of a society. It is somewhat a contrived proposition that politics and religion are inseparable in Islam. Strictly speaking, there is no political theology in Islam as maintained by some *'ulama* and the Islamicists. Even the hypothesis of theo-democracy as propounded by Maulana Abul 'Ala Maududi is difficult to maintain. (*Islami, Riyasat*, Lahore, 1974). An Egyptian judge and writer, Ali Abdar Razik, in his book on the "Fundaments of Government" (*Al Islam wa Usul al-Hukm*) propounds a different theory regarding the ecclesiastical state of Islam. According to him, Islam has never claimed a wordly government; this was left to the free consideration of the believers. The Koran does not mention the Caliphate, consequently it cannot form part of the Islamic dogma. The idea of Caliphate was created by the legal handbooks compiled centuries after the death of the Prophet.

There is no uniform concept of Islamic state. There are wide-ranging differences not only between different sects of Islam — chief among them being Shi'a and Sunni — but also within the sects themselves. Let alone the concept of Islamic state, the 'ulama disagree among themselves — as pointed out by Justice Munir in his report — about the definition of a Muslim. "The court of enquiry", points out W.C. Smith, "and subsequently the world, was presented with the sorry spectacle of Muslim divines no two of whom agreed on the definition of a Muslim, and yet were practically unanimous that all who disagreed should be put to death."[1]

The Koran, it must be noted, gives not the concept of state but a concept of a society instead[2]. The Koran wants to create a society free of exploitation, iniquity, oppression and all forms of injustice. There are innumerable verses to this effect in the Koran. The Koran also makes it obligatory to fight until persecution ends. "And fight them" the Koran says, until persecution is no more, and religion is for Allah. But if they cease, then lo! Allah is seer of what they do."[3] The Koran also makes it clear that the God's viceregency is not for unjust rulers and oppressors.[4] The Koran makes it obligatory that governance should be based strictly on justice. The Koran emphasises distributive justice and condemns concentration and hoarding of wealth. "Woe to one who gathers wealth and counts it. He thinks that his wealth will render him immortal".[5]

But the Koran, as stated above, did not indicate any definite way to institutionalise these values. The four rightly guided caliphs, according to the Sunnite orthodoxy (the Shi'as do not accept the legitimacy of the first three caliphs and even condemn them as usurpers) tried, on the basis of the Koran and Prophet's *sunnah* (practice), to build up a state structure. This state structure also had an element of Arabian tribal ethos.[6] It, therefore, tended to be democratic as the Caliph, even if nominated by his predecessor, needed to legitimise his caliphate through *bay'ah* (literally selling transaction but in this context means giving one's support or swearing loyalty) and for taking important decisions he had to consult either *Majlis-e-shura'* (a consultative body comprising important tribal chiefs and other prominent companions of the Prophet) or the public at large in a mosque.[7] This may not be democracy as we understand it today, but it came closest to it. This near-democratic polity of the first four caliphs assumes greater importance when contrasted with the powerful monarchies of Roman and Sassanid empires surrounding the fledgling state of Islam.[8]

However, the Islamic republic was short-lived and within a little more than thirty years it lost its democratic character and was transformed into dynastic rule. The pressures and limits of the situation worked in that direction. Thus we see that the institution of caliphate as it evolved in the early period of Islam could not strike roots and soon gave way to dynastic rule. However, the dynastic rule whether of the Umayyads or of the Abbasids, could not get theological sanction from the *'ulama*. Eminent 'ulama and theologians from Hasan al-Basari down to Imam al-Ghazali condemned dynastic rule and refused, even under coercive pressure, to accord legitimacy to it.[9] Needless to say, dynastic rule grossly violated all the central values enshrined in the concept of society given by the Koran and resorted to the worst kind of persecution and tyranny. The Islamic polity, during the period of 'Umar and 'Ali, had acquired revolutionary thrust and sought to end tyranny and persecution perpetrated by the Roman and Sassanid empires. The dynastic rule of the Umayyads and Abbasids, on the other hand, re-created monarchical polity based on tyranny and persecution.

IN the light of what has been said above as regards the polity in Islam, we have to examine the contradictions in the state building of Pakistan. We have to start, obviously, with the very foundational notion of creation of Pakistan. Its establishment was based on the theory of two nations which clearly meant that Muslims constitute a separate nation. The theory of separate-nationhood may or may not have political justification, it certainly does not have sanction of the Koran. If anything, the concept of

The author is Director, Institute of Islamic Studies, Bombay.

qaum (nation) in the Koran is composite. The believers and non-believers, according to the Koran, do not constitute separate *qaums* (nations). They belong to one nation, one group only.

Maulana Husain Ahmad Madani throws interesting light on this question (*Muttahida Qaumiyat aur Islam*). According to him the word *qaum* has been used more than 200 times in the Koran. He cites many Koranic verses to emphasise the following: (1) From the point of view of the Koran and its usage the word *qaum* is not applied to the Muslims alone but can be applied to any community, racial, geographical or linguistic. (2) Muslims and non-Muslims (even *kafirs*, that is, non-believers) can, according to Koranic usage, constitute a nation. (3) Even a prophet can and does have relationship with *kafirs*, *mushriks* (polytheists) and wrongdoers as a part of nation. (4) It is necessary to distinguish between *qaum* and *millat*. The latter term means a community of believers irrespective of tribe, race or nation. All believers are united to pursue common spiritual and religious goals.

Maulana Madani also follows the *Sunnah* of the Prophet for constituting composite nationality. The Prophet, after arriving in Medina, drew up an agreement with all sections of the population — Muslims, non-believers, Jews and Christians – to constitute a political community and clearly laid down the terms and conditions for the same. Ibn Hisham, biographer of the Prophet, has mentioned this agreement. (See Sirah Ibn Hisham, vol. I, p 2780). According to section 8 of this agreement all those Jews who have entered into the agreement with Muslim must be treated sympathetically and no injustice should be done to them and their oppressors should be fought. And according to section 15 of the agreement the Jews of Bani 'Auf were given freedom to follow their religion and the Muslims to follow their religion. Except in matters of religion, Muslims and Jews would constitute one group. Thus we see that both the Koranic concept of *qaum* and the Prophet's *Sunnah* do not support the theory of two nations.

Although Jinnah was instrumental in propounding the two-nation theory, he was essentially secular in outlook. He did not entertain any idea of creating a theological state in Pakistan. He assured the people of Pakistan immediately after its birth that "Muslims, Christians, Parsis are equals irrespective of caste, creed of colour". The Jamaat-e-Islami headed by Maulana Maududi was for the creation of a theocratic state in Pakistan. It all along opposed Jinnah as he was opposed to the concept of a theocratic state. It is interesting to note that Jinnah's formulation of the concept of two nations was hedged by secular rather than theological considerations. According to Bizenjo, a Baluch leader, the sum and substance of Jinnah's stand was not that the Muslims were a nation but that "Muslims of India had attained all the essential features and characteristics which were sufficient for differentiating them from the Hindus of India on the basis of culture, history, specific social and economic interests and different values and thus they were qualified to live in a separate territory of their own to safeguard their common interests and to that extent the Muslims of India should be treated as a separate nation." (Rajendra Sareen in *Times of India*, October 27, 1978).

Not that there is no fallacy in this argument, but what is important for us is to note that secular rather than theological considerations impelled Jinnah to demand separate nationhood for Indian Muslims. More than thirty years after partition the question of Pakistani ideology continues to be bitterly contested by the oppressed nationalities of Pakistan like Baluch and Sindh (the Bengladeshis of course separated from West Pakistan proving the absurdity of the concept of Muslim nationhood). Bizenjo keenly contests the concept of Pakistani ideology and asserts that the concept of Muslim nation is a non-issue which does not exist anywhere on earth. He also maintains that in the holy Koran the term Muslim nation has not been used anywhere (*ibid.*)

Another Pakistani intellectual Akbar Y. Mustikhan's is "one of the most coherent presentations of the case against the concept of Pakistan being a Muslim nation" (*ibid*). Pointing out inconsistency in the concept of Pakistan being a Muslim nation, Mustikhan argues, "To say that Pakistan is a Muslim nation is a negation of Muslim 'Ummat' as envisaged in the holy Quran. Secondly, when it is claimed that Pakistan is a Muslim nation, the existence of the Pakistani nation is being rejected. A nation must exist within certain territorial boundaries. But if it is a Muslim nation, then it becomes a transcendental one. In other words, any Muslim from any corner of the world ... can claim equal rights with us as part of this Muslim nation." (*ibid*)

THERE are several other issues involved in the process of state building. The question of nationhood is only one among them. As pointed out earlier, there is no theology of state in Islam and no state structure unanimously agreed to. Apart from the major schism between Shi'as and Sunnis on the concept of Caliphate and Imamat, among Sunnites themselves there are different schools of thought. The Jamaat-e-Islami, for example, believes in theocracy whereas the Jami'at al-'Ulama-i-Hind advocated the cause of composite nationalism. The Jami'at al-'Ulama, as pointed out earlier, bases its case on the Koran and the Sunnah. In matters of legislation too, there are widely differing opinions. There is bitter controvesy in Pakistan as to which school of theology out of the four major ones should have precedence in formulating legislations. Maulana Shah Ahmad Noorani of the Barelvi 'Ulama and Mufti Mehmood of Deoband group are bitter opponents of Jamaat-e-Islami and they want the Hanafi school to have pre-eminent position in the country. (*ibid*, October 28, 1978).

Even the Islamic Ideology Council seems to have been caught in rough weather. Maulana Javed Nomani, a Pesh Imam of Karachi mosque, says: "An advisory Council was set up to Islamise the legal system but its members do not have even a remote relationship with Islam. Majority of its members have wallowed in corrupt and degenerate practices. The Council has been in existencee for the last four years and has held numerous sessions in Lahore, Islamabad hnd Karachi but all this mountain of effort has not produced even a mouse. No Islamic laws have been framed." (*Secular Democracy*, January 1982).

The Majlis-e-Shura' recently appointed by General Zia is similarly a target of fierce attack. "Recently", says Maulana Nomani, "Majlis-e-Shura' was constituted and the President declared that it had brought us closer to the ideal of Islam. He exhorted that every individual's life should be supplied with the ideals of Islam. Can he say the same about those who have been nominated on the Majlis? Most of them are negation of Islam, their lives being closer to the West than to the East." (*ibid*).

In an ideological state like Pakistan there are several dilemmas. There are always puritans who would not tolerate any deviation from ideological purity, howsoever inevitable it might become due to the developing situation. Those in charge of political or social management find it extremely difficult to adhere to ideological purity in the face of acute pressures arising out of a fast developing situation. It is much more so in the present era of rapid socio-economic and technological developments. Even modern political theories like Marxism need constant updating (of course the Marxist puritans too assume the same stance)[10] from time to time. There is another problem also. Around each ideology there crystallises a group of ideologues and leaders. When new developments take place and there is felt need for change, this group feels its position threatened and tries to protect its interests under the garb of ideological purity. New theorists of change emerge on the scene and intellectual battles are fought between old and new ideologues.

These battles are fought more furiously if the ideology in question happens to be means to achieving power. This is precisely what is happening in Pakistan. Maulana Maududi, chief of Jamaat-e-Islami, right from the beginning used theological idiom as a means for achieving power. In a backward country with an acute problem of poverty either religious ideology or Left ideology of some socialist variety has greater chances of success. In a backward country like Pakistan with a weak working class movement and an overwhelming section of the petty bourgeoisie in command of state machinery, religious ideology appears to have greater chances of success. This is more so as Islam, as compared to other religions like Hinduism, Buddhism or Christianity, has much greater potential of developing a coherent political theory. The ideologues of Islam, especially of the Jamaat-e-Islami variety, were fully aware of this potential and set out to exploit it.

However, in a complex socio-political situation and especially when changes are occurring, neat calculations cannot work whatever expertise may have gone into working them out. For a number of years after the establishment of Pakistan, theologians had to lie low for certain reasons. Jinnah and Liaqat Ali Khan's influence (both stood for a secularised state structure) could not be easily undermined. According to Ian Stephens, "Pakistan started independent life under a leader of extraordinary prestige. Almost any innovation that Mr Jinnah chose to ask for, in the early days, her people would have accepted." He further says, "Resemblances can be seen in him to Ataturk, to Tito, to Nasser. He wielded authority of an unquestioned, overriding sort, such as in India Mr Nehru has never quite achieved nor perhaps wanted." (*Pakistan — Old Country New Nation. 1964*)

It is not, therefore, surprising that both Jinnah and Liaqat Ali died in mysterious circumstances.[11] After Jinnah's death, the bureaucracy and the military on the one hand, and the landlords and the nascent capitalist classes on the other, became all-powerful. State power was virtually controlled by these classes. However, there were intersectarian as well as socio-cultural contradictions among these classes. It is interesting to note that Jinnah belonged to a heterodox mercantile Islamic sect but it was his great prestige with the people of Pakistan that pushed his sectarian background into almost oblivion. Not so for others. The military was predominantly Punjabi (specially its officers corps. The big landlords mainly came from Punjab, Sind and Baluchistan. The nascent capitalist class almost belonged to heterodox mercantile communities of Bombay and Gujarat like Memons, Khojas and Bohras. Tamachi rightly points out, "None of these merchants had roots in any unit of the federation and none of them had any previous experience of responding to the needs of industrialisation in the twentieth century." Lastly, the bureaucracy, at least its top echelons, came from the elite of UP immigrants.

Coupled with all this, this fact is also worth noting that Pakistan never developed firm democratic roots as its establishment was not the result of long-drawn-out mass struggle but that of religious chauvinism worked out by the Muslim elites for their calculated ends. The ruling classes, due to lack of homogeneous national character, soon developed sharp contradictions after the overriding authority of Jinnah disappeared from the scene. The so-called Pakistani ideology could not resolve these contradictions. On the contrary in Pakistan, as in any other backward country, these contradictions began to sharpen with the process of development, although it was quite slow. The protest of the suppressed peripheral nationalities like Sindhi, Baluch and Bengali became more and more shrill and accentuated the contradictions. Even the military rule, first of Ayub Khan and later of Yahya Khan, failed to suppress these contradictions between peripheral and core nationalities.

Even the violent break-up of Pakistan in 1971 could not finally resolve these acute contradictions. Democratic polity and culture had not organically evolved in Pakistani society when Bhutto took over in 1971. At best it was authoritarian personal rule grafted over military rule. In 1971 the Pakistani society was plunged into what Jurgen Habermas calls 'legitimation crisis'.[12] Bhutto tried to resolve this crisis created by the loss of legitimation by taking recourse to what he called 'Islamic

Socialism'. Islamic Socialism, concretised in the slogans of 'bread, shelter and clothes' won Bhutto's PPP a large number of seats during the 1970 elections. The Jamaat-e-Islami, despite its aggressive employment of Islamic idiom, failed to win public recognition in the election. However, in the post-break-up period, the situation in Pakistan was too complex to be resolved by the loosely structured PPP and its vaguely defined policy of 'Islamic Socialism'.

Aspirations of the people were aroused by raising radical slogans but it was not possible to fulfil them in view of slow capitalist development. There was even regression in industry in the post-break-up period. Bhutto faced a real dilemma. Tightening measures led to stealthy flight of capital. He settled for balancing between the haves and the have-nots but, as Tamachi points out, "Bhutto's policy of maintaining balance between 'haves' and 'have-nots' left things basically unaltered."[13] Land reforms, though more radical than those of Ayub Khan, were far from creating real momentum for capitalist development on the one hand and winning the support of the poor peasantry on the other.[14] Ronald Herring points out, "Even if Bhutto's PPP had not in part been composed of powerful landlords, the political capacity to carry out so fundamental a reorganisation of the agrarian sector was problematic in the Bhutto period. Bhutto himself argued, as had Ayub Khan before him, that a truly radical land reform would be politically impossible."[15]

BHUTTO'S failure led to a severe legitimation crisis in Pakistani society. Bhutto's was the last attempt in the last decade to resolve the acute contradictions of Pakistani society first within a secular framework and later within religio-secular framework. Bhutto began to employ Islamic idiom more and more as the challenge to his authority grew more and more acute. This led to enforcement of prohibition and to declaring Qadiyanis as a non-Muslim minority. It was the beginning of the process of acquiring Islamic legitimacy on the part of the Pakistani state authorities for their failure to resolve socio-political contradictions arising out of class contradictions in the society within the capitalist framework.

However, in this respect, Habermas makes an interesting observation: "The residue of tradition must, however, escape the administrative grasp, for traditions important for legitimation cannot be regenerated administratively. Furthermore, administrative manipulation of cultural matters has the unintended side effect of causing meanings and norms previously fixed by tradition and belonging to the boundary conditions of the political system to be publicly thematised."[16]

The Islamic traditions now acquired a momentum of their own, no longer remained boundary conditions of the political system, and began to shake "the structures of the depoliticised public realm so important for the continued existence of the system."[17] His political opponents employed the Islamic idiom more aggressively in order to fight the political battle on the Islamic plane. The wilful process of conforming reality to ideology produces more complex problems than the effort to conform ideology to reality. Pakistani society was caught, with the initiation of the former process, in a fresh set of contradictions. The ruling classes now headed by General Zia, a self-confessed dictator, are facing new dilemmas which are no less severe.

There are several 'ulama who are opposed to the Zia regime. These 'ulama have their own version of Islamic tradition and demand much stricter conformity to these traditions. According to a report appearing in *Economist*, London, "A number of religious groups call the council un-Islamic (that is, Majlis-e-Shura'); they feel that its name, Majlis-e-Shoora, taken from a consultative assembly of the Caliphs, is an insult to Islam's glorious past. Some Moslems have even started saying that military dictatorship is against the tenets of the Koran. Fundamentalists are irritated by what they see as unjustified delays in setting up a fully-fledged Islamic state."

The 'Ulama are perfectly right when they maintain that "military dictatorship is against the tenets of the Koran". The Koran, although it does not spell out form of state, condemns, in no uncertain terms, any form of oppression. The Koran clearly pronounces, "The last remnant of those who oppress has been cut off."[18] The Koran also says, "How many oppressing nations We have destroyed! Their cities lie in ruin; desolate are their lofty palaces, abandoned their wells."[19] Thus there is no place for oppression and injustice whatsoever in an Islamic society. The value system of Islam, it is very important to note, lays great emphasis on distributive justice, equality — in both material and spiritual realms — and fraternity. However, the ruling classes, who make use of Islam for their own ends, do not emphasise the value system of Islam. They, instead, show their enthusiasm for enforcing Islamic punishments, thus keeping the status quo undisturbed. In order to implement the core-values of Islam, it would be necessary to radically restructure society in favour of the weak and the oppressed. The Koran even talks of making the weak and the oppressed (mustad'ifin) the leaders of society.[20] It is for this reason that even Zia began his Islamising process by enforcing Islamic punishments like cutting off hands of thieves, stoning adulterers to death and publicly lashing other offenders. He never bothered to give a thought to the core values of Islam as he by no means intended to radically restructure society. His intentions were just the opposite.

The so-called fundamentalists all over the world are using Islamic jargon to throw dust in the eyes of their own people and to push under the carpet serious contradictions which they cannot resolve by maintaining the status quo. The ruling classes in Pakistan are playing no different game.

COMMUNICATION

CPI and Magarwara

I find that Rajeswara Rao has taken umbrage (*Mainstream*, April 17, 1982) at my report on Magarwara killing published in *Mainstream* (April 3, 1982), so much so that he has rushed to the press to defend himself and his Party. One would have expected that with half as much alacrity he would have rushed to the Chief Minister or the Home Minister or even to the Labour Minister of UP demanding an explanation for the carnage; but he did not. Nor did he call a press conference, as the situation demanded, to give the matter the widest possible publicity. He strayed into Dayalkhera village, almost incidentally — during his peregrination of UP on a fund-raising mission — ten days after the massacre. But it did not occur to him that his eminent comrades accompanying him (who presumably live in UP and read the local Lucknow dailies, which on January 5, 6, 7, 1982 were full of gory details of the event) had not even once visited their stricken comrades, neither in Magarwara nor in Unnao where several of them had fled. Or, was it more politic — with the Varanasi Congress looming ahead with all its crevices and quick-sand — to quietly ignore the whole issue?

Rao says, "We held a meeting in which we promised them (the villagers) that this issue would be taken up by us." Now may one ask what steps he has taken since that promise? Has he not been told that it was not Comrade Bhikhalal but Mahipal Singh, a Lok Dal leader. who raised the issue in the UP Assembly and "created a furore"? He says, "Later a detailed report of the incident, describing the atrocities, was circulated by our Central News Service which was published in *New Age* and other journals of our Party". But despite these strenuous efforts at publicity, this ghastly news did not seem to touch a single leader of his party. Is it possible that such important luminaries as the General Secretary of the AITUC, Indrajit Gupta, and Vice-President Joshi do not read the Party papers? And that is why they did not raise the issue in the Lok Sabha? And an Independent member, A.K. Ray, felt compelled to raise it and send a memorandum to the Prime Minister collecting signatures of 20 Members of Parliament belonging to different Opposition parties — Indrajit Gupta's was not one of those! Could it be that while waxing eloquent on Rajiv Gandhi's Budget speech, the General Secretary of the AITUC had just forgotten to mention Magarwara? Even on January 19, at the Boat Club in New Delhi, while protesting against ESMA and NSA, not a word did he say about those who had died in a protest against ESMA.

Rao mentions that *Patriot* gave publicity to the shooting. It certainly did — but when? — full two months after Rao's visit to Dayalkhera.

Would it be incorrect to conclude that the CPI and its trade union wing are no longer in coordination, that the cement which had joined them together is now full of sand, and concern over the fate of the workers has become secondary?

Amiya Rao

New Delhi

Hand-rickshaws in Calcutta

As a temporarily displaced citizen of Calcutta, who has equivocated on occasions before hailing a hand-pulled rickshaw in Calcutta, and who has finally learnt to walk when required in Delhi, I would take the opportunity of reacting to Unnayan's question, 'How do you think it should change? (*Mainstream*, March 27, 1982). My reactions are purely personal, for I have no access to official data on which the decision to take stringent action against unlicensed hand-pulled rickshaws was based.

However, using the figures given by Unnayan, it is interesting to note that not more than 10 per cent of Calcutta's population use rickshaws. (Unnayam has said that more than 10 per cent of the total number of daily trips — 6.8 million — are made by rickshaws. As per the 1981 Census the population of the Calcutta Urban Agglomeration is 9.6 million. Hand-rickshaw users are not only confined to the population of Calcutta Municipal Corporation — 3.24 million — but to all who are in Calcutta for official or personal purposes. Thus, less than 10 per cent of Calcutta's day population use rickshaws). Can we not conclude that its use is, perhaps, only a middle-class phenomenon, to enable those who do not have enough money to hire taxis, to do their shopping (23 per cent) and to pay social calls (23 per cent again, that is, 46 per cent together, of rickshaw travel)?

The hand-pulled rickshaw is essentially a short-distance mode of conveyance, for it is uneconomical, slow and hazardous for long distances. Its abolition would, no doubt, inconvenience the Bengali babu and wife, ever averse to exercise, but its departure would not greatly inconvenience the majority of Calcuttans who have to count every paisa before investment. The lucky children who go to school by rickshaw, go to elitist schools, and those who worry about their clothes getting wet during Calcutta street floods do not deserve special concern. The only segment who will be hard-hit will be those who, for medical reasons, are dependent on rickshaws for transport, and who, apparently, constitute 9 per cent of rickshaw ushers.

The crux of the question, however, is the health of the puller and not of the user. While Unnayan has referred to a Madras report which indicates that cycle-rickshaws pose a greater health hazard, ane would appreciate details as to the size of the sample, the time-span, method of examination, etc. The entire issue seems to hinge on this critical factor, and without details one cannot disregard the evidence of one's eyes. The angle of the hand-rickshawalla's arms, the lack of brakes, the bent back, all cry out to high heavens that the action is agonisingly painful. A cycle-rickshawalla does not grimace or grunt in the same manner. Apart from the medical aspect, the image of one man being 'carried' by another reeks of man's inhumanity to man. (The word 'carried' is deliberately used, for the person hiring the rickshaw sits at the level of the shoulder of the puller). It is the same sentiment that demanded the banning of movement of night-soil as head-load. A hand-pulled rickshaw is, indeed, 'a dramatic image of what is wrong in society', and by forcing those who take to this profession to confront their actual rural dilemma, possibly more good can be done, than by preservation of the status quo. Surely it is significant that the surplus labour of rural Bengal, where land reforms have been implemented to some degree, does not take to hand-rickshaw-pulling, while 92 per cent of hand-rickshaw-pullers come from outside Bengal? The choice must indeed be a very stark one, which motivates a man to leave his village for a totally alien place and profession. The pavements of Calcutta cannot be the safety valve for disordered agrarian conditions outside Bengal.

Extension of the logic used by Unnayan, while extolling the virtues of the hand-pulled rickshaw, would require the introduction, or re-introduction, of the contraption in every congested city of India. It would be labour-intensive, employment-generative, and a boon for the middle class family, hard-hit by cab-fare hikes. This is *reductio ad absurdum*. Then why single out Calcutta for the singular distinction of having hand-pulled rickshaws?

Unnayan has raised pertinent questions about the present licensed owners, and the scope for reform in this regard. Licensed pullers undoubtedly need loans and help, so that they may become owners of their rickshaws one day. As for unlicensed pullers, rural employment schemes, in the districts where they come from, would help to rehabilitate them. Surely it can be done?

DOCUMENT

The Berlinguer Approach

Italian Communist Party's open differences with Moscow have become one of the major items of ideological-political disputation within the Communist World. While this development has touched off a volley of comments and polemics in the Communist as well as anti-Communist press, very little has appeared in the Indian press giving the authentic version of the Italian Communist stand. During the recent visit to Paris of the Italian Communist Party leader Enrico Berlinguer he talked to *Le Monde* reporters Jacques Amalric, Jacques Nobecourt, and Philippe Pons about his party's role in Western Europe's worker movement. This interview is reproduced here from *The Guardian*, weekly, London (April 25, 1982) with due acknowledgement.

During your press conference with Lionel Jospin, First Secretary of the French Socialist Party, you reiterated that you no longer take the Soviet Union as a model. What does the USSR represent for you then?

It's been a long time since we stopped citing the "Soviet model". We reject the very concept of a "model" We're trying to avoid peremptory slogans, societies. I would even say that wanting to impose this model on Eastern Europe was a mistake, and it is one of the origins of the distortions these societies have undergone.

How would you describe the recent goings-on between the Italian Communist Party and the USSR? As a quarrel, a rupture, a schism?

It's very simple. There has been no break and we aren't looking for one. There is a very bitter debate going on.

What you reproach the French Communist Party for most is its adherence to certain Soviet stands?

I don't think that the stands taken by the French Communists are determined by a concern to follow the Soviet line. They are simply choices which differ from ours on certain points.

Do you envisage talks with the Soviets, or will you let the controversy develop?

No meetings are planned for the moment, but we think it would be a step forward if our Soviet comrades published our answers to their criticisms and if they abandoned the tone of anathema or excommunication in favour of objective discussion. We fear that this tone could seriously damage the worker movement, as happened in 1948 in the controversy with Yugoslavia.

Is there a minority among the Italian Communist

Do you think that Poland is on the road to "normalisation", or do you think there will be a confrontation?

It's difficult to foresee. Since the state of emergency I've seen nothing to suggest any relaxation in the military regime's repression and rigidity. Naturally, I don't discount a new confrontation, which would be disastrous not only for the Poles but also for the international situation. I also think that a policy of reprisal through sanctions isn't the best policy to adopt.

Has your party taken a stand on the problem of Poland's debts?

We haven't taken a stand on this particular problem, but on the other hand we're in favour of maintaining and even expanding economic relations with Poland. Reprisal measures would be interpreted by most Poles as hostile and would weaken chances of attenuating repression and opening the way to establishing trade-union and political liberty. Europe's Left-wing forces and Western European governments must continue to call for an end to repression and a return to freedom. I don't see any contradiction in these positions because a policy of sanctions would result in a new crackdown.

Do you believe in the possibility of reform in the Soviet system? Or do you think it is in full decline?

Reforms are absolutely necessary so that Soviet society can resume its way forward. But I don't see any signs right now of reform. I don't think it's impossible, but two external conditions are also necessary: first, the spread of detente, which can have a positive influence on the process of reform in the Soviet Union and Eastern Europe, and second, the Western European worker movement must demonstrate the possibility of socialism based on democracy.

Is this what you mean when you talk about a "third way"?

The "third way" means that within the framework of Western European societies we reject the application of the "Soviet model". But at the same time we note that traditional social democracy is no longer capable of solving the problems which have arisen from the crisis of capitalism and the international crisis.

Doesn't your reference to the "worker movements of Western Europe" impose a major limitation? With the evolution of Western societies, the worker movement has become a numerical minority.

"Worker movement" is a traditional term. But it doesn't exclude the forces which want to participate in the Western European socialist perspective. In recent months, the Italian Communist Party has put considerable stress on the alliance of the working class with the middle classes on the one hand, notably the intellectuals, and on the other through the unions and the political parties, with the sector we call "marginal".

In Italy this term designates the strata of the population which have no place in the modern production process or in industry. It includes youth, women, jobless intellectuals, the elderly — several million people in all. For us it's not a question of simply exploiting demands from social and intellectual quarters as well as the economic world. Our party must, for instance, incorporate feminist demands of all kinds into its own ideological platform.

Without citing him by name, you seem to be referring to Antonio Gramsci's view of the role of the intelligentsia.

Gramsci made a decisive contribution to the analysis of the relationships between the working class and the intelligentsia. But naturally these have changed a great deal. He gave special importance to two categories of intellectuals: schoolmasters and priests. Then came technical experts. These days we continue to pay the same attention to teachers of course, but we also take into consideration those specialists technological progress brings to the fore daily. This is a social stratum with decisive weight in Italy's economic life.

Isn't it paradoxical that there are fewer divergences of opinion with foreign socialists in this search for a "third way" than with the Italian Socialist Party?

That's true to some extent, and perhaps it can be explained by current differences in outlook between the two parties as well as by the fact that in Italy people try to deny or minimise the importance of the new moves our party has introduced and will continue to introduce.

Do you think that a party like the West German Social Democrats belongs to the European Left?

It's not a question of drawing up a list of parties which might or might not belong. In our view, the term is applicable to all groups with more or less of a basis in the working class and which call for socialism, or progress towards socialism. Many differences divide us from the Social Democrat Party but it is a major party of the German working class.

In the context of the "third way", as well as that of the European Left, what becomes of your slogan "historic compromise"?

I decided some time ago not to use it any more. I was weary of vainly stressing hundreds of times over that it didn't mean a government alliance between Communists and Christian Democrats. It wasn't a proposal for a coalition; the idea was that it was necessary for the Italian masses belonging to the three major currents, Communist, Socialist, and Catholic, to get together.

Now we're proposing the "democratic alternative": an alliance among the forces of the Left and eventually other democratic forces to govern without the Christian Democrats. This doesn't mean that we can't come to certain agreement with them on a few principles shared by all the parties which participated in the Resistance and which support the republican constitution. The time for the "democratic alternative" has come.

As far as the "third way" and the quest for a "democratic alternative" are concerned, one has the feeling that uncertainty pervades the Italian Communist Party grassroots after the quarrel with Moscow. How would you define the specifi-

city of the PU in relation to the Socialists?

We don't propose the "third way" as feasible for all the worker parties in Western Europe. But it seems interesting to us to observe that a few socialist parties realise that traditional social-democratic policies have been superseded.

In our party there have been not only very broad, very open discussion and widespread adherence to its decisions, but also a zone of disagreement or perplexity. The formula of the "third way" isn't new; it dates from our 1979 Congress. We are't moving towards social democratisation. Our concerns are two-fold; on the one hand we don't want to make the Soviet Union the villain by holding it up as the world evil by seeing only its negative aspects and contradictions, and on the other hand we don't want to make social democracy the culprit.

We're making a historical criticism of it, differentiated moreover from country to country. Above all we feel that in some countries it represents a majority of the working class. Without wishing to become social democrats, we think that it is necessary to attempt to cooperate with these parties to advance detente and further the worker movement in the direction of socialism.

What is your analysis of the European pacifist movement?

Very positive. It is one of the most important events in Europe in recent years. This spontaneous outburst has arisen among broad strata of the population — youth, the churches, the Catholic movement, and the socialist and social-democratic parties — out of a fear of seeing Europe become the theatre of a so-called limited nuclear war. I don't think it would be limited, but Europe would certainly be at its centre.

Aren't you in basic disagreement with the analysis made by the French Socialist Party?

There is disagreement here. I don't know whether it has to do with the different character the peace movement has taken in France as compared to Italy. In any case we think that the spread of the movement is necessary, also taking into account the events in Poland which have given it a certain impetus. But the conditions for reviving exist and it should be linked to a demand for an end to repression in Poland. We also feel that this movement, given its character in different European countries — though I want to talk mainly about Italy — can't be unilateral: that is, it can't come out against US foreign policy while approving the Soviet Union's. So far, it has been addressed to both big powers.

But in practice it has had an effect mainly on Western nations. It has no equivalent in Eastern Europe.

That does't depend on us.

How then can a unilateral pacifist movement be reconciled with the balanced disarmament you want?

We are, of course, asking that arms reduction on both sides should take security requirements into account, whether of the USSR, the US, the Warsaw Pact, or NATO.

In concrete terms, the spread of this movement in Europe could perfectly well end NATO's December 1979 project concerning Pershing and Cruise missiles, but have no effect on SS 20s, There are 300 of those and they will stay.

I would say all the same that the peace movement which got underway last summer and autumn has already to some extent influenced government positions and helped to set the stage for negotiations in Geneva. To prevent these from bogging down the movement should evolve along lines aimed at the Soviet Union as much as at the US and which also take into account the SS-20s. It is very interesting to see that a majority of the American House of Representatives has come out for a freeze on nuclear arms which would constitute a primary condition for discussing arms reduction.

What is your position in regard to conventional arms in Europe?

Here there is Soviet superiority. As for nuclear arms, it is so difficult to draw up a balance-sheet that we can't establish whether any superiority exists. It isn't to be ruled out, but we think that all nuclear arms and missiles must be considered, not only ground installations in the US and the USSR but also those in countries like France and Great Britain.

What place does the spread of terrorism, particularly in Italy, hold in your analysis of the international power struggle? Does such terrorism arise from strictly Italian causes, or does it proceed from something much more generalised?

We've never excluded the possibility that Italian terrorism has international connections. But what they are remains to be established. Terrorism is a political phenomenon. I would even say political rather than social; it has its social causes but its roots are in Italian political life.

It's sometimes claimed that the spread of terrorism in Italy came about because the Italian Communist Party was too rigid, too structured, because it didn't allow enough flexibility to the younger generations, all those who wanted to be heard and ended up terrorists.

We've heard this superficial analysis of terrorism as a phenomenon of extremist youth before. It should be realised first of all that terrorism isn't the prerogative of youth, and second, that there must be a distinction — which we make — between extremist youth on the left and those who follow the path of fascism. As far as we're concerned we make a distinction: we talk of youth tempted by extremism. At the same time, we're fundamentally opposed to those who choose terrorism. Among our activists there are thousands, even tens of thousands, who have experimented not with terrorism but with extremism and now accept our policies. That's to say, we've done some work in this area even if there are still a few gaps.

Could you develop this idea that terrorism is more of a political than a social phenomenon?

If you study, as has been done, the social makeup of terrorist groups you find people from all levels of society. You find workers of course but also teachers, fair numbers of students, people from society's wealthiest strata. Such social analysis therefore leads nowhere. Which doesn't mean that there are no social reasons for terrorism. But I say political because I think it's a phenomenon closely tied to Italy's political instability.

Isn't there a lot of talk about torture in Italy Right now?

I don't know whether one can speak of torture exactly: it's more a question of harsh treatment. In any case, we've put the matter before Parliament. We've asked for energetic measures against terrorism, but we are absolutely opposed to any process which isn't based on respect for the rules as defined by our Constitution and laws. Even though terrorism has lasted in Italy for almost 13 years the fight against it has generally been conducted in a democratic fashion.

What judgement do you make about the socialist experiment in France since the May elections?

In principle, I don't want to talk about French domestic politics. Still, I can say that overall I believe the Left's experiment to be positive.

What do you think of the nationalisations, for example?

I don't want to go into details and deliver a judgement on every measure that's been taken. The French experiment of the Union of the Left has major importance on the European scale. For Italy, it represents a big encouragement towards change. That said, the situation is very different in France and Italy. You know that in Italy we have a very extensive public sector.

How do you analyse this sector: as a phenomenon of state capitalism, or as a phenomenon which allows the advance of socialism?

If you want to use jargon, you could say it's state capitalism. The public sector can constitute an important lever for transforming society in a socialist direction. But we don't think that socialism has to aim for the nationalisation of all economic life, since a large place should be left for private initiative. □

Gathering to Fight Autocracy

ABHIJIT DASGUPTA

On April 24-26, 1982 a national conference to resist autocracy was held in Delhi. About 1500 delegates and observers came to attend the conference from 16 States and from about 150 mass organisations including those run by some prominent factions of CPI-ML. The idea of holding such a national conference was mooted at a two-day convention held in January in New Delhi.

The conference had two objectives; firstly, to exchange ideas and views among the members of different mass organisations; and secondly, to adopt a political resolution and to form a national council. The sessions of the first day began with the news of sudden death of C.A. Seshadri of *Tamil Nadu People's Front* who took an active part in organising the earlier convention and the present conference. Participants paid tributes to Seshadri's memory. Seshadri was a convenor of PUCL in Madras and one of the founder leaders of '*Tamizhaka Thakkal Munnani*'.

The author is a Research Associate, Department of Sociology, Delhi School of Economics, University of Delhi.

The first day's session included speeches by some guest speakers and members of the organisation committee. A presidium and a steering committee were formed to run the conference.

The twelve-page Draft Document which was circulated among the delegates can be divided into three sections: (a) an introductory note which spells out the significance of convening a national conference to resist autocracy; (b) an apprisal of present economic, political and social situations as well as an assessment of the international political situation; and (c) a declaration of the significance of establishing an United Front to resist autocracy and some immediate and general objectives of the Front.

It may be noted that the Draft Document characterised Indian society as feudal and semi-colonial in nature. It takes note of the deteriorating economic situation. The draft points out that, "all social strata whether farmers, workers, students, government employees or employees of other sectors, cultural workers, intellectuals, and traders, minorities, backward castes, oppressed religious groups, petty middle-class capitalists are overexposed to a progressive shrinkage of their real income ... Heavier burdens due to foreign debts have considerably bent the already emaciated people ... our country today finds itself caught in an economic dead lock, political instability, social breakdown, cultural decadence and barbaric repression".

The Draft does not recognise "exclusive hegemony" of any particular imperialist power over India. It identifies some. For instance India in last January signed seven agreements with France. In 1980 India signed with USA two and a half times the number of contracts that she signed in 1979. BHEL signed an agreement with Siemens of West Germany for technical know-how. A British firm signed a contract with the Paradip Steel Plant. For the purchase of Mirage from France the spade work has already been finalised. In international affairs the present government has clearly departed from the actual implications of non-alignment.

The second section of the Draft deals with the theme of autocracy, particularly the nature of autocratic rule in India. It states, it is extremely essential to identify the Indira autocracy for it represents a particular political tendency, a tendency which serves the interest of the most reactionary, shrewd, ruthless and chauvinistic factions of the ruling classes and which obtain the active support of the imperialist forces. Today the Indira clique is making use of the provisions of the Constitution and equipping itself with all kinds of anti-people black acts and ordinances.

The Draft criticises CPI (M) policies in the following way: "CPI (M)'s Left and Democratic front is the electoral alternative to Indira Government. The CPI (M) made use of the Government machinery and the police in order to crush mass movements in West Bengal, Kerala and Tripura. Besides, this party is extremely intolerant of popular initiative. It has always sought to strengthen the police and the government machinery."

On the second day the delegates were requested to comment on the Draft Document and to suggest amendment. The speakers included representatives from various organisations, for example, *Worker's Union*, *Janbadi Sanskritik Morcha*, *Jharkhand Mukti Morcha*; *Sangharsha Morcha* of Bihar; *Uttarkhand Sangharsha Bahini*, *Samjukta Morcha*, *Khet Majdur Sabha*, *Kishan Sanghursh Samiti* of UP; *Kishan Sangathan* of Rajasthan; *Pragati Sabha* of Haryana, *Rajya Krishak Samiti* of Tripura, *Tamil Nadu People's Front*, *Janabadi Krishak Morcha* of Madhya Pradesh; *Krishak Sangathan Samiti*, *Janasangram Parishad* of Assam; *Krishak Samiti. People's Front*, *Pragatisil Mahila Samiti*, *Worker's Solidarity Organisation* of West Bengal; *People's Democratic Front* of Andhra Pradesh; *Samakalin Teesri Duniya* of Delhi, etc.

The speakers suggested a few amendments to the Draft which were taken into account by the Steering Committee. A number of speakers narrated their experiences of mass struggles. Delegates from Chattisgarh presented an account of the struggle they launched against the oppressive measures. Delegates from Bihar talked about the recent peasant uprisings in various parts of Bihar, especially in Bikram. The delegates decided to form an united front, an executive council and a secretariat.

It should be noted that the deliberations have not touched upon two crucial issues. The first pertains to the role of present leadership in China in the international sphere; and the second relates to the course of action. One may hope that these issues will be discussed by the members of the Executive Council.

It was also stated in the Draft that the newly-formed front will comprise of democratic and struggling organisations and individuals who are not election-oriented. It will be based on the unity among workers, peasants and middle classes for waging peasant and anti-autocracy struggles. It will offer firm support to all just struggles to give them direction and make them countrywide.

The following immediate objectives of the Front were approved by the delegates:

(a) Ensuring distribution of land so that each peasant secures one acre of land;

(b) providing interest free loans to peasants for seeds and fertilisers;

(c) fixing renumerative prices for agricultural produce;

(d) implementing minimum wage fixed by the Government;

(e) providing oil, wheat, rice, pulses, medicines, kerosene free to poor landless peasants during the off season;

(f) ensuring withdrawal of Central Reserve Police Force and armed forces from all States and dismantling of police camps in villages;

(g) demanding arms for Harijans to defend themselves from landlords, casteists and other oppressors;

(h) lifting of ban on organisations of Naga, Mizo, Manipuri and similar other groups.

Some general objectives included (a) confiscation of capital belonging to foreigners and top twenty monopoly houses without compensation; (b) confiscation of lands belonging to big landlords without compensation, and promotion of land reforms on the basis of land to the tiller; (c) eradicating feudal remnants and imperialist infiltration in science and culture in order to allow it to develop in a democratic and patriotic manner; etc.

On the final day of the conference the delegates formed with applause the new front called Indian People's Front.

It was decided that the National Council of the Front will have 101 members representing various states. Out of 101, 81 members were elected by the delegates, A secretariat was formed with seven members. President and seven Vice-Presidents were also elected to help the Front to function properly. In the evening the delegates assembled at the Feroz Shah Kotla ground for an open mass meeting. The delegates, finally, pledged to fight against autocracy and all kinds of authoritarianism in India, and the slogan was raised *Unite to Fight and Fight to Change.* ☐

Scrap Book

(*from page 5*)

Kudremukh irritant is not being allowed to come in the way of mutual cooperation is to be welcomed. Dr Velayati specifically requested India's assistance for rebuilding the steel industry which has been badly affected during the war. According to a release, Industry Minister N.D. Tiwari's response to this request was positive.

The joint statement noted the similarity in Indo-Iranian views in many spheres. Among them was the need to convert the Indian Ocean into a zone of peace, and to resolve the West Asian crisis on the basis of withdrawal of the occupying Israeli forces from all Arab and Palestinian territories. While the littoral countries abutting the Indian Ocean have not had much of a success yet in selling the zone of peace concept to the one big power which matters, namely, the United States, non-aligned countries ought to persist in voicing the demand on every available occasion if only for building up international public opinion against big power presences in the region. From that point of view, the combined voice of Iran and India ought to make a notable contribution to the cause. ☐ *May 4*

Global Inter-dependence *(from page 10)*

for this conference when she said in her inaugural address that: "Inter-dependence is the rationale of the dialogue and cooperation between North and South, and that economic progress in the developing countries can rejuvenate the stagnating economies of the developed world."

The concept of collective self-reliance in the Third World is neither puerile idealism nor a challenge to the developed nations. It is an attempt to do whatever they can by themselves and to promote cooperation with the North. The Brandt Report had tried to show how North and South are inter-dependent and how the jobs and the daily lives of people in the North are interlocked with the interests of poorer communities at the other end of the world. There are nearly 3.25 billion people inhabiting the developing countries. According to Robert McNamara these are the fastest growing markets in the world and hundreds of thousands of jobs in the United States depended on improvement in the plight of the people in these regions. Quite apart from this enlightened argument of inter-dependence, it has also to be considered in a realistic manner whether the developed world can flourish indefinitely as islands of prosperity in a surging sea of deprived and discontented humanity.

It has often been asked, while countries of the North are themselves undergoing severe economic difficulties, how could they be expected to incur undue sacrifices for aiding people in other parts of the world? The economic problems of the North are real and these must be taken into full account in any scheme of North-South dialogue. But as has been argued earlier, aid for development in the South is one of the long-term methods of overcoming the problems of unemployment and slow growth rates in the North.

Perhaps it must also be pointed out that the economic hardships of people of the advanced countries fall in a category somewhat different from those of the developing countries where the struggle is for the basic necessities and amenities of life. An aristocratic character in Leo Tolstoy's novel *War and Peace*, who went to the battle-front in the war against Napoleon, and who had to sleep on the ground together with the common soldiers, mused that the discomfort a man in his bed of roses suffered because of a crumpled petal was just as much as what he suffered lying on the hard, damp ground. This may be psychologically true, certainly in the aristocratic scale of values. But to go without a second car, or an MX or SS-20 missile is perhaps not as agonizing and degrading as to go without a second meal or a primary school or a dispensary.

The role of private enterprise in relation to official development assistance, and aid through multilateral financial institutions has become a matter of policy differences today. As far as the developing countries are concerned, they believe that aid and cooperation must flow through all these three channels. Private enterprises, particularly the multinationals, have become major engines for investment and transfer of technology in the world today. It has been estimated that direct investments by multinationals in the world have reached the level of $ 500 billion. That they have a part to play in Third World development is undeniable. But unlike in the hey-day of capitalism when risks were taken almost recklessly, resulting in the building up of great fortunes and even empires, private enterprise today seeks cast-iron guarantees and the shelter and support of governments before they go into foreign countries, especially into Third World countries. And there are also areas of development in which they are not likely to show interest. This is one of the reasons why official developmental aid and assistance through international institutions like the World Bank and IMF are crucial for Third World development.

While I say this I must make it clear that in my country conditions have emerged, largely due to the stage of economic development that we have now reached, for foreign private enterprise to invest and involve themselves in a wide variety of economic projects. India is not only a vast potential market but a place for secure and lucrative investment by foreign companies. However, aid through multilateral institutions and official channels is indispensable for the developing countries for their development and for promoting larger cooperative relations with the countries of the North.

Official development aid has not only practical but profoundly symbolic significance in the sense of the commitment of the North to the development of the South and to the establishment of a better equation between the two. One of the disappointing trends of the times has been the diminution of this category of assistance. Even more disturbing is the threatened reduction in aid through IDA, the soft-loan affiliate of the World Bank. All these mark retrograde steps on the path of global inter-dependence. It was in the context of the American War of Independence that the greatest and the most far-seeing political philosopher of conservatism, Edmund Burke, told the British parliament that "a great Empire and narrow minds go ill together". I think Edmund Burke would have told the advanced nations of today that great affluence and a narrow world vision go ill together. That the affluent and the advanced have responsibilities to the developing nations is not the argument of the beggar for charity.

Indeed, the scientific technological advances and the present prosperity in Europe and America have not come about suddenly or entirely indigenously. They have been the product of long interaction among nations over many centuries — products, if I may put it irreverently, of the harlotry of international exchange, cooperation and exploitation. It is known that the European Renaissance was impelled by knowledge and ideas that travelled from the East to the West through the Arab lands, and my own country, India, had contributed some of the basic concepts in mathematics and geometry without which the scientific-industrial revolution would have been inconceivable. And the economic development of the United States owes much to the capital and technology first brought and then dramatically expanded in this New World. Thus it ought to be remembered that the advanced knowledge and the affluence of the North is the outcome of a prolonged historical process of inter-change and inter-dependence among peoples and nations. And this process is not likely to stop where it is today, unless those who have attained this power and wealth turn to the final folly of self-annihilation.

While the problems of the Third World are those of food, energy, capital, finance and trade, behind these lie the even more basic questions of educational, cultural, scientific and technological progress. Unless these basic questions are tackled, the gap between the developed and the developing countries will become in the future wider and unbridgeable. Hence the relevance of the question of transfer of technology and the development of education and knowledge in the Third World. The efforts of the developing countries to advance in the higher realms of science and technology, like nuclear and space science, are sometimes looked upon with amusement and suspicion.

It is asked why a poor country like India should indulge in nuclear research and set up nuclear reactors, or try to launch space satellites, or send expeditions to the Antarctic and be concerned with the sea-bed and the laws of the sea and the outer space. The answer is that in order to deal successfully with the colossal elementary needs of our people, while working and sweating on our soil and in our factories, we have got simultaneously to try to reach out to the stars and into the depths of the oceans. The present tendency is for nations that are technologically advanced and militarily strong to corner what they want often disregarding the rights of others and the interests of humanity as a whole. If the disparity in scientific-technological know-how and in the application of it to the undiscovered and unexploited regions of the universe persists and widens, we would be facing a situation in the future when the developing countries might find themselves relatively even less developed than today, and when a few advanced nations might well emerge as the new technological overlords of the world.

The progress of the Third World is, therefore, an indispensable factor for global inter-dependence and for a healthy balance in the world order. The struggle of the developing nations for a fair share in wealth, resources and technology, for better living conditions for the millions of people who live there, for balanced and rapid development, and for acquiring individual and collective self-reliance to the maximum extent possible, is thus of far-reaching significance.

On her part India has right from the beginning of her independence adopted a strategy for development geared to these objectives, but not in an isolationist or autarchic manner, but by remaining in the mainstream of international cooperation. The attainment of basic self-sufficiency in food production is evidence of the priority we gave to the needs of our people in our developmental strategy. I must here acknowledge the contributions made by the United States to our Green Revolution in India. We have, however, not neglected our industrial progress, and even though India today is a predominantly agricultural country and shall remain so in the future, it is ranked as the tenth industrialised nation in the world.

Further, notwithstanding the fact that we have yet to catch up with the rest of the world in general educational progress, we have even today the third largest pool of scientific and technical personnel in the world. The industrial and technological infrastructure built up in our country is of such diversity, sophistication and magnitude that the prospects are bright for further rapid advance in industrialisation and modernisation. In spite of this achievement the problems of development, of equitable distribution, and of fulfilling the needs and aspirations of our people remain gigantic tasks yet to be accomplished. The growth of population is an enormous problem in itself. It has, however, not been understood that during the last one decade we have managed to slow down the rate of population growth despite a radical decline in the death rate and downward trend in infantile mortality. In some parts of the country like the State of Kerala, the family planning programme has been so successful that the growth rate has come down to 1.8 per cent. Our experience in family planning has shown that population control is not the result of a special or separate effort, but of development itself, especially of advance in the education of women. I should like to say that the rising status of women in India is one of the important factors contributing to social, economic and cultural development in our country and it has facilitated our cooperation with the developing and developed countries.

One of the lessons we have learnt from our developmental experience is that maximum degree of self-reliance in agriculture, industry and science and technology has to be acquired if we are to maintain our independence and independent policies, and cooperate with the advanced nations on terms that are not entirely unequal. We believe that the developing nations, by concerting their policies and programmes on basic issues of common interest and by building up collective self-reliance, could generate sufficient strength and confidence for dealing with the powerful and rich advanced nations. India has tried her best to share the industrial and technological know-how it has acquired with other developing nations, and we have today some significant collaboration projects in various countries of Asia, the Middle East and Africa. We believe that it is by beginning with a network of cooperation in our region and in the Third World that we can negotiate credibly with the developed countries for meaningful cooperation. I must add here that we believe very strongly that in all this the UNO and its agencies have a crucial role to play.

One important feature of India's development strategy is that it has been conceived in democratic terms and carried out within the framework of democracy. The application of the democratic method to social and economic development of such massive proportions is to my mind a unique experiment in development. The economic successes of the capitalist system were achieved in Europe before the advent of full democracy, while the colossal social and economic changes brought about in the USSR, China and other socialist countries were under the aegis of totalitarian political systems. At first it was believed that to develop India democratically would be choosing the slowest road to progress. But it has now turned out that progress, though gradual and peaceful, has been steady, substantial and enduring.

One question is asked of India and other developing countries. Are they embarking upon a mere mechanistic process of accumulating and accelerating material production and imitating the pattern followed by the developed countries of today? Or are they adapting industrialisation and science and technology to their specific needs and trying to fit them into their indigenous social-cultural milieu? Our endeavour in India has not been blind imitation. We have tried to create a mixed economy combining elements of socialism with some of the dynamic incentives of private enterprise.

I must, however, emphasise that in the Indian economic system, while the heavy industries and undertakings of public interest are in the public sector, the entire agricultural and small and medium scale industries are in the private sector. It was necessary in our situation, as in most developing countries, to bring about a balance in our strategy between production and growth and the compulsions of social justice. There is one more aspect of the Indian development which deserves emphasis. Being an old society and an ancient civilisation, while speeding up material progress we also maintain our cultural traditions and values which we believe will have a softening as well as enriching effect on development; our endeavour is to add a cultural dimension to our industrial and technological advancement, at the same time rejecting traditions and values which have become outmoded and which impede progress.

As the developmental process in India has moved within a complicated social-cultural system and within a peaceful democratic framework, there has been no high drama attached to this experiment as in the case of changes brought about by violent upheavals in some other societies; but the results have been considerable and have given hope to over the one-sixth of mankind inhabiting our country, and provided a basis for meaningful cooperation with the developing as well as the developed countries for fashioning a new and just international order. □

A Visitor to India

IBNUL HASAN' well-known Pakistani journalist, is on a visit to India and has already met many friends, here. We publish below a sensitive piece he wrote just before leaving Karachi for India. It is reproduced with due acknowledgement from *Pakistan & Gulf Economist*, April 24-30, 1982.

The moment one decides to visit India from the good neighbour, Pakistan — even if the visit is to 'make friends and influence people' — all the physical bigness and military might of India is reduced to a very threatened and harassed India. Similarly, as soon as an Indian plans to undertake a journey to Pakistan, the latter loses its sleep. Already there are more than two and a half million refugees from Afghanistan to be looked after. An Indian, in addition, would ruin the economy of Pakistan and, for sure, upset the demographic balance in the country.

Thus, as I am embarking on a three-week journey to India through a firm and unalterable point of entry and exit, an unchangeable mode of transportation and an irrevocable itinerary, I am terribly conscious of what embarrassment I must be causing to the host country, and what dangers I must be subjecting her to in the next 21 days of my stay there.

First, I am a former army officer and so I must be a great strategist with very keen and observant eyes to pick up all the secret information that is scattered in that vast land, merely to be gathered and passed on to the right people in Islamabad. Second, with my menacing beard and a pugnacious rightist mind, I must be a chauvinist Pakistani out to incite insurgency in India where they have been occupying the Red Fort which my forefathers — notwithstanding the possibility of my being a progeny of some latter-day converts to Islam — had built and from where they ruled the "infidels". And, third, I may actually succeed in making friends and influencing people in India, in which event life in the subcontinent would become so colourless and uneventful that India would be left high and dry, having lost its very precious and only option — war with Pakistan. I really look like a cad in my eyes. I hate myself for my perniciousness.

And yet, there must be something terribly compelling for me to be going to India. I do not have an ailing father there. He died here in Pakistan before my eyes on the night the Indian planes had pounded Karachi most ferociously in December 1971. I do not hold it against India. He would have died one day anyway. So will I. I also do not have friends and relations in India to visit. Mine, fortunately, is not a divided family.

I am going to India because our man of La Mancha, A.T. Chaudhri, asked me to act as his side kick during his three-week tour of India, where he, for a change, was not going to fight the windmills, but wanted to touch the feet of our captive sovereign, Dulcenia del Tobasso, Mother India!

To begin with, I was not too sure if I should be tempted to go to India in April and May when the weather shall be really enervating and Karachi is still cool and breezy. Meanwhile, Rajendra Sareen, my crazy journalist friend from India, who is such an excellent host there, came to my office full of enthusiasm about prospects of good relations between India and Pakistan in spite of whatever might be officially and unofficially poured out through the media to vitiate the climate. He said it was worthwhile to keep backing a good and noble cause even if one has to die a disappointed man.

He sounded right and honest. "So be it", I said, and rang up A.T. Chaudhri in Lahore telling him, "Here I come, your Sancho Panza!"

A shining example of a growing commitment to Indian Industry

Indian Oxygen's intimate association with Indian industry began way back in 1935. Ever since it's been a growing bond, bringing in its wake major developments.

Today, thanks to IOL, Indian industry has ready access to highly advanced and ever developing technology. In the production of gases, ultra pure gases & their mixtures. In their diverse and growing range of applications. In the manufacture of welding consumables and cutting equipment, for the joining and cutting of metals. In the fabrication of complete plants, machinery & cryogenic equipment for the production, storage, handling and distribution of industrial gases.

IOL is also deeply involved in the medical sphere by meeting the needs for vital medical gases, anaesthetic equipment & surgical accessories.

Today, IOL technology has permeated into a wide spectrum of industries and ushered in a revolution in fields such as Steel, Engineering, Electronics & others. Further, IOL is spearheading specialised services to Mining, Agriculture, Communications, Medicine, Research, Defence, Civil Aviation and off-shore prospecting.

Equipped with a technology that's constantly developing and a cadre of indigenously developed talent, IOL pledges to make greater contributions to India's industrial progress. In the years to come.

IOL Indian Oxygen Limited
Promoting self-reliance.

VOL XX NO 37 SATURDAY MAY 15, 1982 Re 1

EDITOR'S NOTEBOOK

Elections: Mood and Morale

IF the elections to four State Assemblies of Haryana and Himachal, Kerala and West Bengal, along with the by-elections in seven Lok Sabha constituencies, scheduled to take place on May 19, are to be regarded as a sort of "mini-General Election" — as some commentators have chosen to characterise them — it are to be admitted that the Indian political scene today is bereft of any live national issue affecting the life and living of the overwhelming majority of the population.

Neither any economic issue nor concern for national security in the critical regional environment of today has figured prominently in the poll campaign of any of the parties. No doubt the Opposition has in its electioneering campaign harped on the continued impoverishment of the common man under the Indira raj, ignoring the fact that their own performance record on this score when in office was hardly better, if not worse. As for the issue of security, the Prime Minister did make passing references to Pakistan's acquisition of US arms in electioneering speeches in Himachal Pradesh and Haryana, but one can hardly call these references part of a move to make this the centre-piece of the Congress-I election campaign.

What has figured prominently in the poll campaign — particularly in Kerala and West Bengal — is the question of the States' autonomy contraposed to the Centre's authority. While the Left Front in West Bengal has made this issue virtually an article of faith with it, the Opposition parties, by and large, have expressed themselves strongly in favour of more powers for the States. How far this urge towards the States' autonomy is a reflection of the Opposition having lost hopes of coming to power at the Centre and how far it is a genuine interest in more decentralisation, is yet to be examined.

The important point to note is a perceptible trend towards States-level politics and consequent withdrawal from playing a national role on the part of almost all political parties. Perhaps the only exception to this attitude is BJP which has been calculatedly planning to emerge as the national alternative by breaking out of its traditional grooves in the Hindi-speaking regions of the North. Despite their sign-

boards of being national level parties, the two Communist Parties have for all practical purposes chosen to withdraw into the two pockets of Kerala and West Bengal. As for the other parties in the Opposition, they have no aspirations nor pretensions to be anything but regional or local political entities.

As a matter of fact, this is true of the Congress-I as well. Take away the personality of Indira Gandhi and what is left of the Congress-I is a motley assortment of politicos who can function only at the State level and have hardly any all-India standing. In the Indira Cabinet at the Centre, there are hardly three or four who can claim to have a political footing anywhere outside their native State.

So far as the party organisation is concerned, the Congress-I has shown up that it is riddled with intense group fighting. This has come out very conspicuously in the current election campaign: from the selection of candidates to the arrangements for electioneering, in-fighting has become the bane of the Congress-I. How deep is the malady could be seen from the fact that in West Bengal, where it has been fighting with its back to the wall, one of the main advantages of its adversary, the CPI-M, is the faction-fighting within the Congress-I. In Haryana, where the Congress-I could manage to return to office in 1980 only by the wholesale migration of defectors led by Bhajan Lal into the Congress-I, there has been this time a spate of revolts mostly among these 1980 turncoats, a matter of no small concern for the Congress-I leadership: the rebels standing against the official Congress-I candidates seem to be sanguine about holding the casting vote in a contest in which the two sides — the Congress-I and the Opposition — are expected to end up in a close finish, so that they may be able to bargain for their price when the horse-trading for Ministry-making would start after the poll. In other words, the rebels look forward to rewards instead of punishment for defection.

This election campaign has brought out more strikingly than at any time in the past the one-pillar structure that the Congress-I has become. None of the Pradesh level leaders has any image to present before the electorate. It is as if Indira Gandhi has been contesting from every constituency. A sample survey of her campaigning shows that she tries to cover almost every constituency in a State. For instance, in the first two days of her hurricane tour of Haryana, she covered as many as 27 centres — perhaps a world record for whistle-stop electioneering. While all this is impressive as a heroic feat of human endurance, it brings out in equally bold relief the lack of a party machinery worth the name behind the ruling party of India. Peronism could not have done better on this score.

Another feature of the present election battle which also provides a touch of Peronism in the Indian situation has been the persistent talk of the elections being likely to be cancelled on some plea or other — in one state or the other or all over the country. While Indira Gandhi's irrepressible Home Minister has mercifully refrained from alleging such rumours of poll postponement as being foreign-inspired, the fact that the apprehension in the mind of a large section of people all over the country about poll cancellation persists even at the time of writing these lines, is an index of the erosion of public confidence in the Indira Government's commitment to run the parliamentary system in a normal manner. The reason for such erosion could be traced to the memory of the imposition of Emergency (1975-77) and the intermittent campaign by the frontmen of the Indira Congress about the need for a presidential form of government instead of the parliamentary system. Add to this the precedent created by the blatantly repeated postponement of the Garhwal by-election for the Lok Sabha, and one realises why such misgivings about poll postponement persist. In this background, the Chief Election Commissioner's repeated assurance that the poll would take place as scheduled assumes significance and so does the Prime Minister's effort at dispelling any fears on this score.

If the current round of elections are to be taken as the mid-point sounding board of the electorate's mood for Indira Gandhi's present five-year term as Prime Minister (1980-85), then the dominant feeling is that the nation's morale is at a low ebb. The electioneering of course saw the usual turn-out of crowds but there has been no evidence of a massive response anywhere. Anger may not be writ large on the voter but his sullenness, bordering on cynical indifference, is unconcealed over a large part of the country. This is certainly not a sign of health for the body politic. A politically debilitated India can very well tempt the external forces that threaten the country's security while parochial and regional elements can certainly make the most in such a state of sagging morale.

Not a very promising prospect for a nation that has a major role to play in the troubled world of today.

May 12 *N.C.*

COMMENTARY

Signals from Kashmir

FACED with the ticklish problem of whether or not to give his assent to the highly controversial legislation enacted by the Jammu and Kashmir legislature, the Governor, B.K. Nehru, has adopted the line of least resistance by referring it to the Attorney General of India for his opinion. Governor Nehru may only be buying time with this manoeuvre. Irrespective of the AG's opinion, the new Kashmir "resettlement" bill is likely to prove a factor of acrimony in Centre-State relations which have not in any case been blessed with any marked degree of cordiality of late. If the Attorney-General opines that the measure is morally untenable, all that the Governor can do is to return it to the State Assembly for reconsideration. But, under the State Constitution, he will have no escape from giving his assent to it once the State legislature passes it for the second time. The Attorney-General will find it hard to challenge its constitutional validity. The State Constitution clearly empowers the legislature to enact such a law under Section 6; the second proviso to Article 7 of the Indian Constitution also confers the required powers on the State legislature. And herein lies the dilemma facing the Governor.

The bill empowers the State Government to regulate through permits the return of State subjects living in Pakistan and their resettlement. Applications for such permits can be made directly by the concerned persons or through their relations in the State. Widows and direct "descendants" of such persons are also eligible to apply. The bill is ostensibly aimed at reuniting the families separated by partition and the subsequent Pakistani invasion of Jammu and Kashmir. If it has become highly controversial and evoked strong regional, communal and political reactions, it is because in effect the legislation can legalise the influx into the State of people who are by now Pakistani citizens, and in the process throw the floodgates open for the entry of what its critics have described as "all and sundry" into the Valley.

The bill is not so "new" after all. Introduced unofficially in March 1980, it languished in the select committee for the last two years. Sheikh Abdullah chose to resurrect it in March this year and get it enacted in the face of strong objections from the minuscule Opposition which staged a protest walk-out at the stage of its adoption. The Sheikh couldn't care less; he had an overwhelming majority in his National Conference to back him. More than its contents, the timing of the enactment has raised the hackles of his critics, who have linked it to the imminence of the Assembly poll. The Sheikh could not have been unaware that this precisely would be the reaction. There is good reason to regard this as a populist ploy to get support of the Muslim majority in the State. Imminence of elections invariably provokes populism in all rulers, and it would not be fair to the Sheikh to think that he is an exception.

Were it only an electoral gambit, it would have passed muster. But it is more than that, and some of its implications are quite disconcerting in the context of the tenuous state of Centre-State relations at present, and potentially mischievous in the context of the political mileage the Sheikh can draw for himself in both events — either the Governor assenting to it or withholding assent. Here is a situation which the Sheikh can turn to his advantage either way. If the bill becomes law, he can claim credit for having asserted once again the special status Jammu and Kashmir enjoys within the Union. If it is prevented from becoming law, he can berate the Centre for trying to dilute the meaning of Article 370.

The trauma of separated families was common to both the border States of Kashmir and Punjab, but more so in the case of the former since a large number got caught or chose to stay in Pakistan-occupied Kashmir. It is on the grounds of humanitarianism that the Sheikh now commends the bill which he suggests would remove the legal barriers standing in the way of divided families reuniting. Has the Sheikh turned soft-hearted purely for humanitarian reasons? It was he who had arranged for large-scale deportations of thousands of persons across the border during his first term of office between 1947 and 1953 (when he was overthrown) merely because he felt then that they would endanger his political survival. He seems to want their return now, ironically enough, for immediate political gains. In their own way, G.M. Sadiq and Bakshi Ghulam Mohammad had arranged for the return of several thousands of those deportees without dangling before them the prospect of Indian citizenship.

The Kashmir bill is basically a citizenship bill and it has been rightly argued that the State legislature is within its rights to enact laws regulating the status and privileges of its permanent residents. Once permits are granted to applicants and their resettlement facilitated, they will not only acquire permanent residentship of the State but also acquire automatically Indian citizenship. Article 370 may have been conceived in special times in the face of special circumstances, but its retention in the Indian Constitution permits such an anomaly. In the event, both the State legislature and the Indian Parliament possess the right to grant citizenship. The bulk of those aspiring to return to Kashmir and resettle have been Pakistani citizens; their descendants have acquired Pakistani citizenship automatically by virtue of their birth in Pakistan. Their resettlement would entitle them to claim Indian citizenship. Is it the Sheikh's intention that citizenship is to be conferred on them merely on a technical enablement, irrespective of any mechanism or provision for satisfaction, if not guarantee, of their commitments and loyalties? Both the Sheikh and the bill are silent on this issue. But the fact remains that the Kashmir bill clearly envisages and endorses the possibility of aliens becoming Indian citizens. Is it the Sheikh's intention to burden Jammu and Kashmir with "foreigners" almost on the pattern of Assam, which is currently in convulsions over this very anomaly? Further, it is to be noted that the population of the Jammu and Ladakh regions has not endorsed the bill's provisions. They see in this a threat to the delicate balance between the three regions of J & K.

The bill has no provisions defining the rights and privileges apart from citizenship of those who return. This has, naturally and with good reason, sent shivers down the backs of those who came into the State as refugees and have since settled down there. There are two aspects to Jammu and Kashmir's "refugee problem" which are unique to the State. Firstly, the refugees from Pakistan-occupied Kashmir who have settled down on evacuee lands, particularly in the Rajouri and Poonch areas of Jammu, have been clamouring for proprietary rights over the land. Secondly, refugees fleeing from Pakistan after partition have been clamouring for citizenship rights. The "refugee problem" invariably looms as a major issue in elections, and political parties have seen nothing wrong in exploiting it to their advantage. The problem evokes strong emotional overtones. However, the State Government has kept the demands aside while promising redress and relief at each successive general election. The new bill has naturally engendered fears among these refugees that they will be uprooted in the event of the resettled claiming their property.

Largely because of haste, impelled no doubt by the possibility of an early poll ahead of the scheduled June date, the bill as enacted is stated to contain any number of lacunae. For one thing, it was a private member's bill and apparently the State's law department never studied its implications. No attempt was made in any case to consult the Centre. Secondly, there is no evidence of the Select Committee having had a say in the matter. Consequently, the legislature was not given an opportunity to assess the provisions in terms of the interaction between it and Central laws and regulations, especially in relation to Pakistanis wanting to visit the State and the State subjects wanting to visit Pakistan. There is no cut-off date for the return of Pakistani nationals of Kashmiri origin, nor has any time-limit been specified within which applications need to be made. (The Sheikh has already had a running battle with the Centre over the alleged appropriation by the Union Home Ministry of the State's right to check the antecedents of Pakistani applicants for Indian visas. He contends that the chore falls within the State's jurisdiction.) The bill does not specify the authority who will certify the entitlement for resettlement. On the contrary, it confers omnibus powers on the State Government.

It was not surprising therefore that the Governor was in two minds when the bill reached his table for his signature. Sheikh Abdullah has made conciliatory noises since then, but given his unpredictable temperament, his critics contend, he may resort to using the Governor's hesitancy as an alibi for embarking on a collision course with the Centre. Even otherwise there are good grounds to infer that the Sheikh is sending signals to the Centre through the new bill. It is yet another move of his to impress on the Centre that he is the undisputed boss in Kashmir and Congress(I)-sponsored attempts to topple him will be resisted. The bill is basically the Valley's signal to the Centre and is of a piece with the oft-resorted-to ploy of the Lion of Kashmir to demand the reopening of the Srinagar-Rawalpindi Road.

The Centre must forthwith initiate a dialogue with the Sheikh to work out a modus vivendi. The legislation has raised many questions of national import which should be brought to the notice of Sheikh Abdullah and thrashed out in consultation with him. ☐

Urs's Kranti Party

THE formation of a new regional party by Devaraj Urs in Karnataka — the Karnataka Kranti Ranga — has not come as a surprise. After his bizarre experiments in many parties bearing the Congress label, he decided to have his own special set-up, presumably to avoid imposed or invited embarrassments arising from being leader of a party unit without seeing eye to eye with the "national" leaderships concerned and without any prospect of his own acceptance as supremo *a la* Charan Singh. The only question that was being debated in quarters interested in him was whether he would link his group with the Lok Dal or float his own outfit. The latter course, for which he has finally opted, obviously leaves him with elbow room for negotiations with other parties well in time for the State Assembly elections some time hence.

It is an open question whether indeed Devaraj Urs and his party can be taken very seriously yet. It is true that despite his political antics in the last four years or so he continues to have a following in his home State. But what he has cannot be seen as a fully organised political structure; he has plenty of admirers who see him as the leader if not saviour of certain middle or backward castes, and he does have a basic organisation. The word "cadres" is not quite appropriate here, for that is a category which few of our numerous parties can boast of. There is also the fact that he is not the only backward castes leader in the State; there are others. But having been Chief Minister for a time and having carried forward or initiated activities for the benefit of the backward castes, he does appear to have more weight still than most of the backward caste leaders in other parties including the ruling Congress-I.

It is clear that the Karnataka Kranti Ranga will be the equivalent, more or less, of Charan Singh's Lok Dal in Western UP and Haryana — after all, Charan too began with his own brand of 'Kranti' (the formation of the Bharatiya Kranti Dal, which took many forms and finally emerged as the present Lok Dal, will be remembered). The political approach, the slogans and the vote base to be sought to be attracted will be practically on the same lines. The only difference is perhaps that, first, Devaraj Urs is a more sophisticated political hand than Charan Singh, and second, he has the advantage, if he knows how to use it, of starting almost from scratch in the matter of relations with other non-Congress-I parties in Karnataka.

Some recent occasions have shown that Devaraj is by no means a spent force. Additionally, there is the dissidence in the ranks of the Congress-I. Janata Party is in disarray. Whatever there is of the Lok Dal is bound to be with Urs when it comes to the crunch. Possible political rivals do not have his stature, even if it may seem rather diminished at the moment. It is quite possible that he can bring together these different elements to give his new party flesh and bones. The naming of the new party was preceded, at the recent convention of Urs supporters, by an assurance from the leader that he would not lead them into the Lok Dal or the BJP.

All this does not mean however that a new force has already emerged on the Karnataka political scene — though Devaraj Urs remains a formidable force. There is a long way to go, and Urs knows from experience that if there is no unremitting build-up, many of his present supporters may leave him high and dry. Another aspect is the fresh spurt of regional parties, with Andhra film star N.T. Rama Rao showing the way, by forming his Telugu Desam. Urs has an advantage over Rama Rao; he is no novice at the game of power politics, and can prove quite a headache for the Indira Congress. Whether Urs suceeeds in his brave new adventure or not — there is no reason why he should not—there is no doubt that he will be a problem for the Congress-I leadership in the months ahead.

The language agitation in the wake of the Gokak report raises another question. What stand will Urs take? Will he be the reconciler or a partisan? Would he be content to be a regional factor when it is possible for him to emerge later as a national factor?

Assembly Polls Scenario

NARENDRA SHARMA

FOUR States—Himachal Pradesh, Haryana, Kerala and West Bengal—go to polls on May 19. The Himachal and Haryana Assemblies were dissolved on April 17 and the two States are under caretaker Congress-I Governments. Kerala came under President's rule in March this year, while West Bengal continues to be ruled by the Left Front Government elected in 1977.

Each of these four States has passed through different sets of circumstances, leading the various national and State parties to evolve different sets of strategies to face the elections. Elections to the Himachal and Haryana Assemblies were last held in 1977 during the heyday of Janata rule. After the massive victory of the Congress-I in the 1980 Lok Sabha poll, en masse defections from the two Janata Legislature Parties led to Congress-I Government being formed in these States. The CPI-M-led Left Democratic Front Government headed by E.K. Nayanar survived only for 26 months and fell in November last year following the exit of the Congress-S and the Kerala Congress-(M) from the Front as a result of convulsions in the Front and the sectarian attitude of the CPI-M. The United Democratic Front Government headed by Congress-I leader K. Karunakaran, which came to power in December last, had to quit exactly 80 days later following its failure to muster a majority in the Assembly. In West Bengal, the CPI-M with 178 MLAs commanded a substantial majority on its own in a house of 294, though it governed the State along with other Left Front partners who had to be under the overall guidance of the leading partner. However, the Left Front Government did not face any convulsions within.

This provides an insight into the combinations and alliances that have come into being in the four States for fighting the forthcoming elections. It is to be noted that none of the national parties has been able to evolve a uniform pattern of alliance which could be said to be based on common policies and principles.

Haryana on its own; it is virtually on its own in Himachal Pradesh as well, except that it has conceded one seat (Solan) to the AICP. It is leading an eleven-party United Democratic Front, comprising partners ranging from Congress (Antony) to SRP (a sectional party of Ezhavas) and NDP (political wing of the Nair Service Society), besides the two groups of Kerala Congress (Christian) and the Muslim League. In West Bengal, it has among its alliance partners not only the Congress-S and the AICP but also smaller groupings like Muslim League, Gorkha League, Christian Democratic Party; the West Bengal Janata Party too would have been in the Congress-I-led front but for the dispute over the number of seats.

The Left parties can hardly take exception to such alliances and describe them as unprincipled. For, only the other day the Kerala Congress-(M) was an important partner of the Left Democratic Front in Kerala, and after the elections, if the balance of forces so demands, the LDF leaders may not hesitate to have a deal with it again. The same has been the case with the Muslim League. Of course these compromises with communal and sectarian groups in Kerala by both the Congress and the Left parties have given some strength to the communal RSS-BJP in that State.

Even in the current State elections, Left parties like the CPI-M have followed devious tactics, though unsuccessfully. The CPI-M, for instance, tried hard to come to terms with the Lok Dal for a seat or two in Haryana though the Lok Dal had entered into a firm alliance with the BJP. Interestingly, the CPI and the CPI-M, both of whom claim to be committed to forging unity of Left forces, could not reach an understanding on joining forces in Haryana and Himachal; the CPI is contesting only 14 seats in Haryana and 20 in Himachal, while the CPI-M has put up candidates for 5 and 3 seats respectively in the two States.

More interesting is the fact that both the CPs are now cooperating with the anxious to forge an alliance with the Lok Dal even if the latter had seat adjustments with the BJP; his objection was to the Lok Dal-BJP alliance as such. Moreover, a large number of Congress-J candidates in Haryana are those who had been denied tickets by the Congress-I and whose post-election career will be unpredictable.

The case of the apparently formidable alliance between Lok Dal and BJP appears no different. In fact, it is confined only to Haryana where Lok Dal is fighting 67 seats (two of them could not get the election symbol in time and are contesting on free symbols, and BJP 24. Despite overall alliance between these two parties in Haryana their candidates are confronting each other in the Nuh constituency of Gurgaon district; the BJP has taken exception to the Lok Dal giving ticket at the last moment to Deen Mohammad in Nuh, on the ground that he is a protege of Congress-I leader Bansi Lal and therefore cannot be relied upon after elections.

In fact, it can be said that the BJP has successfully put into practice its original election strategy according to which it seemed anxious to have electoral alliance with the Lok Dal but wanted it to be confined to Haryana. The Lok Dal sought to force the issue by announcing a list of 38 candidates for Himachal on the very first day of filling nominations. The BJP refused to be cowed and offered only 12 seats to Lok Dal, which was not acceptable to the latter. Now they are confronting each other in 30 of the Himachal Pradesh constituencies. But the Lok Dal can only split Opposition votes in half a dozen constituencies in Himachal to the detriment of BJP.

The Lok Dal-BJP alliance is inoperative in West Bengal and Kerala, because Lok Dal hardly exists there; moreover, BJP has gone it alone in these two States with a view to expanding its base in order to be able to emerge as a focal point for the anti-Left forces in both Sates with the help of the RSS. Significantly, in Kerala, the BJP has not put up candidates for the seats allotted to the NDP and SRP by the UDF; nor is it averse to an unofficial arrangement with the CPI-M in some areas where the CPI-M believes that a division of votes would help the CPI-M candidates against the UDF. The BJP strategy in Kerala has imparted a peculiar character to the fight between the two Fronts.

The Janata Party appears to be at the cross-roads. It has alliance with the Congress-S in Haryana and Himachal, which means little for either, for the Congress-S is non-existent in both States. After the split in the party's Kerala unit in December last, the official group is now a partner in the LDF and the rebel group is a part of the UDF. Janata's ally Congress-S is in alliance with the Congress-I in West Bengal without the central leaders of the Congress-S or the Janata being in a position to do anything about it.

The present pattern of alliances holds out prospects of greater opportunistic horse-trading in the post-election period than was witnessed ever before. This is a clear possibility at least in the case of Haryana, Himachal and Kerala.

West Bengal **Total Seats 294**

Corruption: Who is to Fight It?

C.N. CHITTA RANJAN

THE steady growth of corruption in practically every walk of life which threatens not only India's democratic framework but its very moral fibre and the future of its impoverished millions, has been so much discussed over the years, particularly in recent years — witness the columns and columns of allegations, counter-allegations, denials, commission reports, court proceedings, learned speeches and theses and what not that have filled the media — that the five-hour debate in the Rajya Sabha on the subject on May 6 came as quite an anti-climax. Indeed, despite all the fuss that preceded the debate and the smug air of self congratulation that seemed to fill almost everyone present, it was no serious debate at all. One member, who caused a mild flutter by comparing politicians denouncing corruption with prostitutes preaching chastity, later described the whole exercise as a waste on "hot air" of the time of the house and money from the public exchequer. It is difficult to disagree with him.

Curious was the willing-to-wound-but-afraid-to-strike attitude that marked most of the speeches from both sides of the house. Perhaps this is not difficult to understand, considering that it is not only the politicians in power at the moment who can claim the distinction of misusing authority in overt or covert ways. After all those who are now in Opposition in Parliament did wield power at the Centre not so long ago, as also in several States, and thus have what may be described as a "past" of their own not qualitatively very different from the past or the present of today's rulers. Bringing out skeletons from cupboards is a game both sides can play, and they are only too conscious of this fact. Hence the colourlessness of last Thursday's debate which brought out nothing — neither facts nor serious thinking about ways to check the growth of malpractices of all kinds.

Of course it is easy enough to go back into the dim corridors of history and show, for example, that even Kautilya in his *Arthashastra* had listed the numerous ways in which the king's courtiers could cheat him and promote their own interests and had spoken of the difficulty of detecting corruption among government servants. From those distant days to the present, in West and East, and in our own sub-continent including the goings-on in the many small kingdoms, the glamorous Mughal court and in British imperial years, there is no dearth of evidence of the crafty and the influential cornering wealth and exploiting the majority through both terror and trickery. But all that is hardly any consolation for present and future generations in this country, pinning their hopes on a Constitution based, at least theoretically, on egalitarian concepts.

In the debate, naturally, some debating points were duly made. Were not Pratap Singh Kairon, Ghulam Mohammed Bakshi, Biju Patnaik dealt with? Nobody seemed keen to ask how they were dealt with, or how their families are fairing now. Whether the handful who could be identified as practitioners of political corruption in the early years of freedom were given the punishment they had earned is one question. Whether the enlargement of the areas of corruption and political malpractices in the subsequent period, say the sixties, the seventies and the early eighties, has been dealt with seriously by any section of the ruling elites, is another. If the corrupt politicians at top levels in the fifties could be counted on one's fingers, that is a proposition which simply does not apply to the present period. Cement, to mix a metaphor, is only the tip of the ice-berg. For one Saklecha or one Antulay who has been brought to public notice, there are umpteen Antulays and Saklechas — not to speak of Jagannath Mishras and Gundu Raos and Bhajan Lals and Bansi Lals and Karunanidhis — who are not even discussed properly. Here we are talking mainly of use or misuse of political power and administrative machinery; and this according to some of our pundits, including newly-emerged "leaders", is hardly to be equated with "personal corruption". If Maruti is twice blessed, so is Kanti Desai's record.

The simple truth is that no politician who really matters is in a position to cast the first stone. It is hardly possible for those holding forth about corruption and its eradication to demand, much less insist on, a full inquiry into the connections, within India and without, of politicians who have held office in recent years, of administrative officers patronised by them and of their near and dear ones. Who would want to open that foul Pandora's box?

Nobody takes Home Minister Zail Singh seriously any more, so consider what Finance Minister Pranab Mukherjee says. According to him, it is no good questioning the integrity of everyone. True. But then he claims that corruption is confined to a "microscopic minority". This surely is a highly questionable assertion. It is not as if the public are not aware of the many things going on around them, even if they do not become fully aware of the quiet, large-scale operations at the topmost levels of administration and between politicians and bureaucrats on the one hand and the urban and rural millionaires and multinationals on the other. Even granting Mukherjee's theory, the number of industrial houses that have multiplied their assets to astounding proportions despite the MRTP Act and other laws, constitute only a "microscopic minority", statistic-wise, of the number of the industries, big and small, all over this vast country. Is the political clout and the capacity to corrupt of this "microscopic minority" negligible? Even Mukherjee cannot deny that the opposite is true.

Home Minister Zail Singh readily agreed to a suggestion for a code of conduct for political parties to end the evil of corruption. Both the suggestion and the acceptance must be said to be hypocritical. It is not as if the problem of corruption has not been considered in this country at various stages and remedies, howsoever limited, suggested. There was the Santhanam Committee whose report has been gathering dust for two decades or so. That committee had made several recommendations for dealing with corruption at the political level. Then came the Administrative Reforms Commission. And then the Sachar Committee. Every time the authorities could not avoid facing a public outcry on charges of corruption and misuse of power, there was a commission of inquiry. All these reports add up to very much more than a code of conduct. And the Government has not taken any action aimed at ending corruption on the basis of even such reports. So what does Zail Singh mean by lauding a code of conduct? He does not approve of a permanent machinery because he cannot find "angels" to fill it with. He does not want Confucius to be brought in because there was no democracy around when Confucius was around. Now we have Zail Singh around, and that makes a deal of difference to everything, including corruption.

Not to go too far back, and not bringing in politicians with an axe to grind, let us consider what Jammu and Kashmir Governor B.K. Nehru said in an important lecture at Madras in December last. "It is unfortunately undeniable that corruption has spread to every part of the governmental apparatus: the record in office of no political party is better than of any other....An uncomfortably large number of politicians and Ministers are corrupt; corruption is universal in the lower ranks of the public services, it has affected the middle ranks as well and is now infecting the apex of our administrative structure...The consequence is the abnegation of the rule of law. The honest man cannot enjoy the rights the law gives him; the dishonest cannot be punished for any transgression of it." B.K. Nehru went on to discuss the system, the cost of elections and the rest, and suggested certain remedies which, however, would not seem adequate to meet the situation. For instance, what he wants done to the electoral system would mean a virtual rewriting of the Constitution. In any case he boldly pinpointed the disease and examined its dimensions. Much earlier the then President, V.V. Giri, called in a Lucknow speech for an end to political interference in the administration. Nothing seems to make any impact on the quarters concerned. Drift is the watchword. If it is not drift, then it is acquiescence. No one kills the goose that lays the golden egg, not the beneficiaries anyway.

It is not only among politicians and in the executive that such degeneration has taken place. Even the judiciary which, despite its generally conservative if not reactionary attitude on socio-economic questions, had maintained a tradition of integrity and uprightness, would seem to have been invaded by dubious personalities. The weakness of some of the high-ups in the higher judiciary for their relatives, especially in the Bar, was noted with regret by no less a person than the Chief Justice of India not long ago. Among journalists, the self-styled watchdogs of democracy, there is no dearth of gentlemen who know which side of the bread is buttered, and conduct themselves accordingly in matters professional. Lawyers and doctors — making due allowance for the honourable exceptions as in the case of journalists — generally are more concerned with status-giving income which is not always accounted for. Many in these various categories need to be looked at rather closely by the tax and other authorities concerned.

In recent times it has been the fashion for one regime to throw the blame for everything on the previous regime. But, except for the sharp contrast in the style of functioning, say, of the Janata and the Congress-I, it is difficult to see any difference in the way the country has been governed or in the way certain small sections of influential people have continued to benefit. The large houses grow larger, whoever is in power. Published figures prove it. Smugglers and dacoits have increasingly become a major factor in political operations and have their own impact on the administration. The Dhanbad mafia and the UP or Madhya Pradesh dacoits may have caught the eye, but they are not the only ones with political clout and posing a constant threat to clean administration. They and their political and other patrons can get away, literally, with murder. Despite the unending tears of Charan Singh and company, nobody, either of the Congress-I or of the old Janata, has tried to implement land reforms honestly, with the result that the Harijans and the landless poor generally, apart from the hard-pressed marginal farmers, continue in their traditional state of misery and fear. Who then is preaching about corruption to whom?

Not that corruption is limited to politicians and bureaucrats (in the case of the latter one would question B.K. Nehru's tacit assumption that corruption moves from bottom to top instead of the other way round – Vohra and Appu are among exceptions). The British rulers corrupted a certain class of people — the rich and the educated middle class — and made these their allies in establishing colonial rule. Of course they did not bargain for the revolt that arose later on, but that is another matter. It is those some classes, with their numbers increased in keeping with the vastly increased population of the country and the new opportunities for self-aggrandisement opened up by the achievement of Independence, who are today playing the corruption game to the increasing disadvantage of the already disadvantaged and deprived sections of the population. It may be true that controls have engendered corruption to some extent, but the basic fact is that the corrupt elements in society — from politicians and officials at one end to big business, rich farmers and the underworld of gangsters and smugglers at the other — are taking advantage of every opportunity provided, not only by controls but even by loopholes in the various laws. The existence of an estimated Rs 12,000 crores of black money in the economy — and that may be an under-estimate — speaks volumes. And the official attitude to black money is patent in the Bearer Bonds Scheme which unfortunately even the Supreme Court has blessed. Tax evasion and cheating of the public have been officially rendered honourable. Where then do we turn for remedy?

It has often been said that the most effective remedy for this state of affairs lies in electoral reform. It is true that elections are becoming ever costlier, so that no honest man who earns his livelihood by the sweat of his brow can hope to contest any election, from panchayat level to Parliament level; why, even to contest student union elections in the universities one needs quite a pile of money, and much of it is black. There have been many recommendations about limiting election expenses; there are even laws. But to what purpose? Can anybody keep track of the crores of rupees spent on elections in this vast country? Are parties and individual politicians made to keep honest account of what they get and what they spend on elections? The prescribed limit is entirely farcical and irrelevant, and even the illiterate voter is aware of this truth. The vast election expenses, met by the interests that stand to gain by utilising the influence gained thereby, are certainly the biggest source of corruption of public life. But can it be made different by law or pious declarations? Experience shows that it cannot. B.K. Nehru's proposals for a total overhaul are as unrealistic as the latest suggestions for committees & codes. Krishan Kant's suggestion for provision for positive rejection of candidates/parties has a moral point, but whether it will work in the prevailing climate is doubtful. Again, it is a question of educating the voter and strengthening his/her will to register resentment. It is true that if it happens it will bring about a sea-change in the atmosphere, for it will then not be a choice of the lesser evil as those who cast their votes see it but an assertion of popular will not to allow undesirable groups to hold office and fatten themselves and their kind. As things stand, however, the idea must be shelved as no more than an exercise in fantasy; it cannot be tried out even as an experiment, for obvious reasons.

Elections do form the most important pillar of democracy. And the way money flows like water during elections makes it a poor support for genuine democracy which is what we the People have given unto ourselves under the Constitution. But the rot begins elsewhere. It is in the primary and secondary schools, in the universities, in the "temples of learning". Those who do get educated are not educated to run an efficient democracy based on the awareness of the masses. There is corruption in the education system, which affects and shapes future rulers even if it serves little purpose so far as the vast poor millions of the country are concerned. There is corruption in the implementation of projects and schemes meant for the weaker sections; the intended beneficiaries are where they were, while intermediaries, including officials and contractors and political operators, have flourished on the proceeds. As in the case of the Green Revolution, whatever is done for improving agriculture and rural life has benefited only the top crust of rich people who in turn are the real wielders of power, with control over the administration, including the police, and the political machine. Fund-raising for election purposes, once a fine art and now crude arm-twisting and plain quid pro quo business, is part of the process of degeneration of public life.

What then is to be done? Even the parties claiming to be progressive and to be espousing the cause of the poor majority do not have the vaguest idea. They never had, perhaps, for otherwise over the years a mass movement would have been built up and drastic changes would have been forced on the status quoists. Even now there seems to be no other viable answer except organised mass protest and mass action against corruption and corrupt persons whether in the political set-up and the administration or in the private sector, urban and rural. It has to be seen as a shame that in what we boast of as the world's largest democracy a handful of corrupt elements, with backing from layers of allies-cum-beneficiaries, remain respectable. Even those found guilty of malpractices are back as respectable politicians or businessmen or public figures of one sort or another. And there are the defectors. Even in 1967, when Charan Singh crossed the floor with some of his followers to bring down the Congress Ministry and head a non-Congress coalition himself in UP, defection was widely considered detestable. No longer is defection a dirty word. It is indeed easier to count politicians who have stuck to one party than those who have been changing sides for considerations of office or at least some influential position in the Establishment. No one is interested in banning defections though almost everyone has been talking about it for years — for who knows when and to whom floor-crossing will prove profitable?

Clearly, then, tinkering with the electoral system is not the answer. Nor allowing known corrupt parties and individuals to get into the seats of power again and again, strengthening themselves by virtue of the power of patronage that election to office bestows upon them. The answer is to organise public opinion, especially among the exploited majority (the majority who in the Rajya Sabha were described as being "honest people" and most of whom are below what our statistics-minded rulers would call the Poverty Line), to rise against corruption and its practitioners.

Even if such a course upsets elections and electoral calculations of our parties, including the Left, it is worth it. For, such mass awakening and action will mean redemption, if not in the short run, at least in the long term. That will make sense only if it is realised that India does not end with this or the next generation. India, as has been said, is eternal; we cannot permit corruption and prostitution of democracy also to become eternal.

That was what Gandhiji said once — that corruption by the few must be fought by the many. The logic remains valid.☐

Technology, Management and Productivity

Y. NAYUDAMMA

THE major problems that face India today are its large population, poverty, unemployment, under-employment and equity. Technology, management and will of the people properly applied can produce the desired results to raise the capacity of man to produce and consume and to enhance productivity. This year, 1982, is the Productivity Year. Productivity as a way of life, has existed from times immemorial, but as a concept of efficiency and as a means of improving the standard of living of people it is of recent origin.

The need for increased productivity arises out of the availability of limited resources like capital and under-utilisation of existing human and material resources. Optimisation of productivity is more important than maximisation. High increase in productivity of a small percentage of the working population is less effective than small increase in productivity of a large percentage of the population.

The concept is not to make the 'poor wealthy' but the 'poor productive', releasing their resourcefulness, creative innovative attitudes and problem-solving capabilities. The key to increase productivity in India is to motivate, mobilise and utilise human resources more effectively.

Productivity is not synonymous with increase in production. Productivity is only an indicator of the ratio of output of goods and services to the input factors. European Productivity Agency (EPA) defines productivity as "an attitude of mind — a mentality of progress — of the constant improvement of that which exists ... to do better than yesterday ... to continuously apply new techniques and new methods...It is faith in human progress."

What is Research? Research means many things to many people. It is essentially an attitude of mind — an open, analytical, critical, creative, inventive and innovative mind; always looking out for change; to better the best performance. It is tomorrow's mind instead of yesterday's mind.

The result of research and the product of problem solving mind is technology. Technology increases productivity combining both quantity and quality of goods and services. Technology has social dimensions too.

The job of management is to make use of all resources including human resources efficiently and effectively, working with people, putting them together and getting things done. The poor capacity utilisation is directly attributed to poor management in both private and public enterprises. The fundamental strengths for production's enhancement lie in people and their attitudes, skills and motivation.

The Asian Productivity Organisation published in 1980 an "Integrated Report on Factors which Hinder or Help Productivity improvement in the Asian Region", based on an Analysis of Cross Country Experience. I was associated with this Report. The major factors that affect productivity in the manufacturing sector appear to be (1) Government Policy; (2) resource endowment; (3) cultural and social values and institutions; (4) industrial relations; (5) management style; and (6) technology.

Allow me to disuss the last two important factors — technology and management.

Technology today is mankind's main enterprise. There is no escape for us from the accelerating effect and massive impact of technology on our outlook, life styles, social development, industrial and economic growth and increased productivity. The contribution of technology to development is rated at between 50 and 60 per cent and much more than labour and capital outputs. Technology is a change agent — bringing about changes in attitude and life styles of people. Managers are makers of change in an orderly way, as technology is changing fast. Changes in technologies and social values go hand in hand, each affecting the other. It is the social values that decide life styles; the life styles dictate the needs, and the needs decide technologies. The job of the manager is to bring about a healthy orderly change for the small group he is working with and bring about a satisfactory life, improving the working and living conditions of people. The job of the manager is not necessarily problem solving but problem prevention. The most significant thing for him is to look far into the future. While the captains of industry and the leaders are pushing for short-term gains, the management has to think ahead.

Technology is a resource. It has a cost, life cycle, long gestation period, involves risks, and is transferable, marketable and negotiable. Therefore, technical literacy of management is crucial for bargaining, particularly when it is common knowledge that technological knowledge and use are avilable with only a small group of nations and transnational corporations that exercise a cumulative hierarchical control.

Generating technology without making use of what exists in the world and importing technology without the ability to assess, bargain, choose, adapt and assimilate it are inefficient and/ expensive. Technology import advocated as a short-cut, allows only ready-made technology applied to an existing environment in advanced countries; has resulted in imitative growth practices, undesirable modes of consumerism, not based on actual social needs, serving only the narrow elite and not the majority;

Bangladesh: Crisis of External Dependence

REHMAN SOBHAN

The crisis situation that bedevils the economy of Bangladesh has many dimensions as well as lessons for all developing countries. The question is one of understanding the country's relationship with the world economic system, and of finding out where to draw the line in respect of dependence on foreign aid and assistance, keeping self-reliant internal development in view. Dr Rehman Sobhan, noted economist who was a member of the Planning Commission under the first Government of independent Bangladesh and is now Research Director, Bangladesh Institute of Development Studies Dacca, attempts in this paper candid in-depth, analysis. It is reproduced with due acknowledgement from *Development and Change*, **London, Vol. 12, 1981.**—*Editor*

ON the face of it Bangladesh would appear to represent a relatively low level of interaction with the world economic system. If this process of integration is measured in terms of the contribution of external trade to GDP or to the control of foreign investment over the domestic economy, Bangladesh comes fairly low down in any league table of external penetration into various developing economies. It is the central theme of this paper, however, that within the prevailing structural constraints of Bangladesh society, the process of development has itself contributed to the growth of external linkages, dependency and domination of the domestic polity. These external linkages have in turn become critical to the emergence and development of an indigenous bourgeoisie, whose entire fortunes are intimately tied up with access to external resources in the name of development.

This particular pattern of dependent development has contributed to the increase in poverty, along with concentrations in the ownership of wealth and inequality in the distribution of income without leading to a significant expansion of the reproductive forces within the economy. This growing immiserisation of the masses in juxtaposition to the parasitice and unproductive character of the dependent bourgeoisie has accentuated the need for external resource flows to both sustain subsistence consumption and to feed the growing appetites of the aspirant bourgeoisie. The incapacity of the system to involve the masses in the development process and their consequent marginalisation from the productive process is likely to threaten the stability of the domestic social order and, by extension, will affect Bangladesh's linkages with the world economic system.

The traditional pattern of interrelationships between the metropolitan colonial powers and the developing countries was determined by the extent of penetration of foreign capital into the domestic economies of those countries and by the integration of components of these economies into a world market. External capital was used to exploit the natural resources of the recipient country through development of productive forces and/or through trade. The bourgeoisie of the colonial power tended to dominate domestic production for export and external trade and to control the service infrastructure which sustained these enclave economies. In the post-colonial phase this external penetration was diversified into import-substituting industrialisation in the developing country to serve its domestic market, usually in collaboration with an emerging indigenous bourgeoisie. The balance of power between the metropolitan and indigenous bourgeoisie reflected the growth of a domestic bourgeoisie and the extent of neo-colonial domination of the particular economy.

In the last decade there has been a further development of this relationship through the TNCs of the metropolitan countries. Faced with rising costs of production at home, these TNCs have responded by moving both capital and particular production processes into selected developing countries (Amin 1974; Iconicoff n.d.). This reflects an attempt to forge a new international division of labour in order to utilise the cheaper labour of these countries to meet the domestic demand within the developed world for the more labour-intensive types of products.

It may be useful to analyse Bangladesh's external linkages within the perspective of relationships identified above. Bangladesh was liberated from colonial domination on December 16, 1971. Between August 1947 and December 1971 it had been part of Pakistan but the eastern region, now Bangladesh, had been politically dominated and economically exploited by the ruling elites based in West Pakistan. The metropolitan elites of West Pakistan had not only monopolised claims on external and domestic resources but also dominated industry, external trade, banking, insurance and even inland water transport within Bangladesh. The liberation of Bangladesh saw the physical withdrawal of the Pakistani bourgeoisie from Bangladesh and the resumption of control over their abandoned assets by the government of Bangladesh.

This peculiar pattern of domination meant that from the outset of its liberation, a major part of the domestic and external economy of Bangladesh was indigenously owned and controlled and at least in the urban sector, was within the control of the government. The more traditional pattern of external penetration manifested in the extent of outside ownership and control of domestic capital and economic activity had been pre-empted by the domination of the West Pakistani bourgeoisie over the Bangladesh economy in the pre-liberation period to the exclusion of foreign capital. As a result only one per cent of fixed assets in industry in pre-liberation Bangladesh was owned by non-Pakistanis who also exercised marginal control over banking, insurance and transport (Sobhan & Ahmad 1980). In the immediate aftermath of liberation the position of non-Pakistani capital was further abridged by the government's nationalisation programme which affected foreign enterprises in the jute industry and trade and in inland water transport. Following this, foreign capital was limited to dominant control by TNCs only in the pharmaceutical and tea industries, a marginal share in banking, and peripheral control in some industries such as tobacco, toiletries and oxygen. In all the industries the Government of Bangladesh emerged as a minor partner through takeover of shares originally owned by the departing Pakistanis.

The low exposure to foreign penetration of the Bangladesh economy may have owed to the historical legacy of Pakistani rule, but it was compounded by Bangladesh's low exploitability. The country has few natural resources which are internationally marketable. Jute is the only resource with a significant external market where Bangladesh enjoys any sort of international comparative advantage. As a consequence, Bangladesh's external trade is heavily dominated by exports of jute and jute goods which account for around 80 per cent of commodity exports. In turn Bangladesh accounts for around 75 per cent of world exports of raw jute and 50 per cent of exports of jute goods (World Bank 1973).

Apart from its jute, foreign capital has found little occasion to rush to Bangladesh. It had involved itself in tea plantations in the northeastern region of the country from the period of British colonial rule. The British originally had also dominated the export trade of jute. But they gradually gave ground to local traders, initially from India, then from Pakistan and finally from Bangladesh itself, so that today the trade in Bangladesh is largely in indigenous hands, both in the public and private sector. A large part of the international market for jute and jute goods, however, even now continues to be controlled by intermediaries operating from London and New York who cream-off part of the surplus. As a result, the jute economy in Bangladesh remains highly sensitive to the level of activity in the world economy, which contributes to considerable instability in the earnings of jute growers and the jute industry.

Besides renewable resources such as jute and tea, Bangladesh's sole non-renewable resource is natural gas, where it has an estimated reserve of nine trillion cubic feet. Current levels of exploitation are low, its use being limited to feeding an indigenous fertilizer industry, power generation, and domestic consumption in a few urban areas. Its extraction and marketing are currently within the state sector. External involvement has been mariginal though attempts are now under way to invole TNCs in the liquefaction of natural gas for export.

Outside of exploitation of natural resources, TNCs have been marginally involved in import-substituting industrialization. Philips is one example of a TNC involved in the assembly of a narrow range of consumer durables and also in tne manufacture of bulbs. Imperial Tobacco has invested in cigarette manufacture; Lever Brothers is dominant in the manufacture of soap and detergents; and British Oxygen produces oxygen. Apart from the case of oxygen, none of these companies enjoys a monopoly of the local product market, having to contend with competition from both local private enterprise and the state sector. The products of these overseas brand products, however, are favoured by upper income consumers.

It is only in the pharmaceutical sector that TNCs have played a prominent role in monopolising the local market by substituting imports. A number of well-known TNCs such as Pfizer, Hoecht, ICI, May and Baker, Squibbs, Organon, have investments in Bangladesh, all in equity partnership with the Government. Their operations largely consist of importing their own formulatious, which are then bottled or tabletted in their plants in Bangladesh. This is seen as a cost-saving exercise as much as a device to vaultover tariff bariers on finished imports of pharmaceutical products. Whilst the TNCs dominate the local market, there is a growing indigenous industry, some of which produces TNC brand products under licence but without equity asssociation.

All these industries with foreign equity still do not account for more than one per cent of fixed assets in the manufacturing sector, so that the TNC presence, whether in resource exploitation, import substitution, or export of labour-intensive products, is negligible. To this extent, the various cycles of dependence identified by various writers on the world system are not fully relevant to the Bangladesh experience.

THE absence of foreign control in the classical sense over the domestic economy has meant that the dominant social formations within Bangladesh are largely indigenous. In the initial period after liberation the state sector, dominated by petty bourgeois elements which had led the nationalist struggle, became the dominant decision maker. This became an important factor in abridging the scope of penetration into Bangladesh by external capital. With 85 per cent of fixed assets in the manufacturing sector, along with the bulk of banking and insurance, foreign trade, communications, and power all under state ownership, decision making and investment priorities, on the face of it, were largely indigenously determined.

This tendency experienced some erosion as a consequence of a change of regime in 1975 following the assassination of the then President, Sheikh

Mujibur Rahman. Power then moved from the regime which had led the liberation struggle into the hands of a more affluent segment of the bourgeoisie deriving its power from the military coup, which put a regime favourably disposed towards the West in control. The new regime sought to promote the development of a local capitalist class and to open up the economy to private foreign investment. Though some enlargement of the private sector has occurred in recent years, there has as yet been no quantitatively significant erosion of the dominance of public enterprise over the non-traditional sector or in the indigenously-controlled character of the domestic economy.

This recent strategy of promoting, under state patronage, some segments of the local bourgeoisie to constitute a private capitalist sector has had important consequences for opening-up the economy to external penetration. The historical legacy of of external political domination up to 1971 over the areas that now constitute Bangladesh, meant that the indigenous bourgeoisie remained an underdeveloped social entity (Sobhan 1980). Most upward mobile elements of the petty bourgeoisie sought outlets in the professions or in the state machinery. The growth of an indigenous bourgeoisie in trade and industry was a phenomenon of the 1960s. It was the direct result of the Pakistani colonial regime to create a comprador class which could act as local surrogates in the exercise of their colonial domination of Bangladesh. The sudden withdrawal of the colonial power not only created a major social vacuum within Bangladesh but, as a result of the post-liberation nationalisation policies, drastically abridged the power and prospects of the nascent capitalist class indigenous to Bangladesh which had grown up under colonial patronage (Sobhan & Ahmad 1980).

The further growth of a domestic bourgeoisie from the outset of liberation thus came to be tied-up with access to external resources. For the aspirant private bourgeoisie who enjoyed limited control over productive assets, it meant that their only vehicle for linkage with the world system was through the role of an intermediary.

The volume and distribution of earnings from performing the role of intermediary depend critically on the volume of external assistance coming into Bangladesh and on access to state patronage. The higher the inflow of external assistance, the more profits accrue to this class. External resources inflows directly and indirectly further the growth and prosperity of this class of intermediaries. Directly, the intermediaries function as commission agents for foreign suppliers, tendering for development projects and supplies of a wide range of intermediate and finished goods such as raw cotton, fertiliser and cement. Indirectly, this class derives profits from the distribution of goods imported by the state trading corporation or finished goods manufactured in public enterprises through the processing of imported intermediate. The volume of external resources available to the economy was and remains a critical determinant of the fortunes of this class.

To the extent that Bangladesh came to be dependent on foreign aid to fund 60 per cent of its investments, 85 per cent of its development budget, and 63 per cent of its commodity imports, the level of external resource inflows was critically dependent on the volume of aid available to the economy. This aspirant bourgeoisie has thus come to acquire a material stake in an aid-dependent regime. Any trend towards abridging external dependence, at least in the short run, is likely to be directly inimical to the interests of these commission agents of foreign suppliers. To the extent that the growth of self-reliance remains contingent on expansion in import-substituting domestic production of goods and services, the bourgeoisie could be compensated through control of domestically-traded goods produced in the state sector or even directly produced in the state sector or even directly produced by the private sector. Insofar as the level of domestic output is itself contingent on aided imports, however, even this class of distributors of manufactures remains critically dependent on maintaining the level of aid-financed imports.

In the case of the private sector, liquid resources generated from agency commissions provide the basis for diversification into capitalist production, but few of this class are inclined to reinvest their trading capital directly in industry. As a result, under state patronage extended to the local bourgeoisie through loan and equity financing from state-owned financial institutions, the state itself has become the main source of capitalist growth in Bangladesh. The capacity of these state institutions to promote expansion of the capitalist sector is itself contingent on foreign loans to the state financing institutions, largely extended through multinational financing institutions such as the World Bank and Asian Development Bank. Thus, capitalist development in Bangladesh has become a direct function of aid availability intermediate by the state.

THE dependence on aid flows is not restricted to the growth aspirations of a domestic capitalist class. A growing state bourgeoisie, both within the permanent bureaucracy as well as the executives of the state enterprises, has also become heavily dependent on inflows of external assistance to further its sectional interests. Part of this compulsion originates in the power and patronage which drives from initiating and executing large aid-financed development projects. Both in terms of intra-bureaucratic power and within the polity, control over such projects become a major resource for those contending for state power. Patronage derived from such projects extends over employment as well as the dispensation of favours to suppliers of goods and services and to construction contractors. Vast fortunes can accrue so both these categories of beneficiaries as a consequence of expenditure decisions within the state sector. Some of these benefits may even return to the decision makers, who thus acquire a material stake in aid-financed projects.

The built-in drive to seek more and more foreign aid is thus a common feature of the development process in Bangladesh. Many state functionaries, however, seek more aid to serve as a cushion for their own managerial inadequacies. Thus, for example, the capacity to ensure capacity utilisation of mechanised irrigation facilities provided by the state to farmers, generates pressure for more aid-financed import of irrigation equipment rather than for fuller utilisation of installed capacity. Thus, new aid becomes the main source for expanding acreage under irrigation or even for maintaining current levels of irrigation. Aid in these situations becomes the soft option designed to mitigate the consequences of deteriorating operating performance within the economy. Given the contingent benefits which accrue to particular classes from aid, we can get some insight into the low and deteriorating performance of some state-run enterprises.

The aid compulsion of the private and state bourgeoisie is reflected in the character and aspirations of the political leadership. The dominant political party currently administering the polity in Bangladesh is itself an expression of the interests and ambitions of the aspirant local bourgeoisie. This element seeks to control the state machine in order both to dispense patronage as a basis for expanding its power over the polity, and to seek material benefit from the dispensation of this patronage. This entente between the party and state machine, however tends to be strained by intra-class conflicts over control of the patronage derived from access to foreign aid. Indeed, where the ruling party express its class character through the aspirations of the private sector, some element of contradiction arises with the state bourgeoisie over both control and perspectives towards foreign aid.

The critical role of foreign aid in the development of the bourgeoisie is reinforced by the essentially parasitic and unproductive character of this class. The private sector has shown little capacity to generate surpluses to finance capital formation. The low level of private savings, manifested directly in direct equity investments and in contributions to direct taxation, is a measure of the unproductive character of this class (Government of Bangladesh 1980). A low savings capacity is compounded by high levels of conspicuous consumption based largely on consumption standards and on goods imported from abroad. The appetite of this class even absorbs the savings of overseas migrants, who provide a growing and variable source of foreign exchange remittance to Bangladesh (Mahmood 1980). To the extent that state controls over investment limit the extent of import-substituting investment derived from imported consumption standards, both imports and overseas travel to spend their earnings have become an outlet to the comprador bourgeoisie for the incomes derived from acting as intermediaries to foreign suppliers. What investment is made by this class is in part channelled abroad, both for profits and as an insurance against domestic upheaval. At home a high rate of investments in luxury housing is encouraged by state-financing institutions and generates rentier income from foreigners who come to live in Bangladesh as another by-product of the aid regime. Along with urban landlordism, preferred domestic investments of their equity by the bourgeoisie are directed to trade and speculation.

The pattern of the urban economy is paralleled in the rural areas where rich farmers use their access to state power to monopolize imported fertilizer, irrigation facilities, pesticides and aid-financed credit programmes (Devylder & Asplund 1979). To this end, the growing affluence of a section of the rural bourgeoisie has emerged as another by-product of the aid regime.

IT would be misleading, however, to see aid serving solely as a prop of the bourgeoise in Bangladesh. Within the present social framework, aid has now become central to the expectations and conditions of life of a much wider segment of the urban and even rural populations of Bangladesh. Some of main social classes who are directly or indirectly dependent on aid for their subsistence consumption and livelihood are drawn from the following social groups: rural poor, urban population of six major cities, government employees, workers in public enterprises and in large-scale manufacturing enterprises school teachers in state educational institutions, college and university students resident in hostels, the armed forces and other instruments of state power. The nature of this dependency may be reviewed in relation to the rural and urban segments of the population.

The dependence of the rural poor is part of a built-in structural crisis within Bangladesh society. At present, 50 per cent of all rural households are classified as functionally landless, whilst another 25 per cent find it difficult to ensure subsistence from their cultivable land and have to seek supplementary sources of income. This indicates that some three-quarters of rural households in Bangladesh are now dependent in all or part on the market economy, as opposed to subsistence cultivation, for their basic staple diet. This large category of the rural population is now directly touched by the world economic system to the extent that the regime for foodgrains in Bangladesh has over the years become critically dependent on imports. Today some 12-15 per cent of foodgrains consumed in Bangladesh are imported, but at least 50 per cent of domestic output is not marketed. Of the grain entering the market, imports account for 30-50 per cent, depending on the size of the domestic crop and the marketable surplus derived from this. The availability of grain imports has a crucial importance for the volume of marketed grain and consequently the market price of grain. Both factors are critical to the level of consumption of the rural poor, for whom scarcity of grain on the market, operating through the price mechanism, may make all the difference between starvation and subsistence. This was made apparent in 1974 when the delay, for political reasons, by the US Government in sanctions US PL-480 food aid, precipitated a severe famine in Bangladesh where some 30,000 perished (Sobhan 1979).

Foodgrain aid has acquired a further dimension in the lives of the rural poor. It is now being used to underwrite the Rural Public Works Programme and the Food for Work Programme which are becoming increasingly important as a source of livelihood for a growing segment of the rural poor. To the extent that aided imports of fertiliser and irrigation equipment determine the spread of HYV cultivation, this is again affecting the lives of sharecroppers and wage laboureres who benefit, from the employment-enhancing features of the new technology.

Outside of the rural areas, food aid is directly instrumental in providing consumption of basic staples to the entire population of six major urban centres in Bangladesh. These areas are covered by what is known as 'statutory rationing': a basic supply of rice, wheat, sugar, edible oils and kerosene is guaranteed to all households through the issue of ration cards. Ration shops sell a fixed quantity of these basic items at a controlled price. This ration is extended to cover all Government employees wherever they are posted in Bangladesh, workers in state enterprises and large industrial units, students resident in college and university hostels, Government school teachers, and all personnel of the armed forces and other related law and order agencies. An estimated 4.5 million people are covered by this ration programme (Zahir & Kamal n.d.). A large and at times overwhelming part of the ration programme sustained by food imports, mostly procured under various aid programmes. These people identified above are a priority group for determining access to food aid, which includes both foodgrain and edible oil, and are particularly vulnerable to any major change in the level of external assistance, though less so then the rural poor since any cut in aid flows is usually passed on to the latter as long as government policy gives priority to meetiag obligations to the statutory rationing areas and special groups identified above. The political assumption underlying this policy is that these groups are politically the most volatile.

The mechanism of aid dependence, however, does not restrict itself to direct consumption of food items. Many items of daily consumption produced by the domestic manufacturing sector have come to depend on aid-financed imports. The level of output of the textile industry depends on aid-financed imports of raw cotton. The textile industry not only provides a basic need for the whole industry, but is a source of livelihood for 160,000 industrial workers and another 300,000 artisan households who depend on supplies of yarn made available by the state-owned textile industry to feed their handlooms. Cuts in the supply of raw cotton thus have wide ramifications in the price of cloth and in the income of those involved in its manufacture.

In other import-dependent sectors of industry such as steel which produces corrugated iron sheets, a basic item in rural housing, the engineering industry which contributes to rural development and public transport, and the chemical industry which produces soap and refined petroleum products, commodity aid is crucial to ensure capacity utilisation. If one allows for the crucial role of spare parts and supplies of other intermediates, then in most sectors access to foreign exchange for imports is a critical variable in determining levels of domestic output. Scarcities in domestic output cannot readily be be compensated by imports due to foreign exchange constraints. Thus, a reduced level of imports of intermediates as a result of aid cuts can have far-reaching repercussions on domestic price levels and levels of consumption of basic necessities.

IT may be useful at this stage briefly to identify the main parameters of external dependence in Bangladesh and to trace this to the systemic constraints which perpetuate this dependence. In 1978-79 the share of aid in Bangladesh in relation to GDP had risen to 8.5 per cent compared to three per cent in 1973-74 (Government of Bangladesh 1980). The rising importance of aid was even more critically apparent in areas relating to the external economy of Bangladesh and in the financing of its development programmes. In 1978-79 foreign aid effectively financed 65 per cent of Bangladesh's annual import bill and enabled Bangladesh to cover a balance-of-payments gap which was 116 per cent of its external earnings. This growing dependence on aid to finance Bangladesh's foreign exchange gap corresponds with a decline in the importance of Bangladesh's own external earnings. Two decades ago, in 1960, Bangladesh's external earnings effectively financed its entire import bill compared to 46 per cent in 1978-79.

The mounting foreign exchange gap is matched by the growing importance of aid to finance the domestic resource gap. The share of aid in financing domestic development expenditure on government account was 75 per cent in 1978-79, but if we measure aggregate investment which includes private and public investment and excludes the non-investment component of development expenditure, aid financed 60 per cent of investment in 1978-79 compared to 41.6 per cent in 1973-74.

That aid financing is even more crucial to government expenditures is apparent from a review of the development budget. Aid is now, both directly and indirectly, an important sourcee of revenue to the Government. If we look at its direct contribution, food aid contributed significant resources to the exchequer. All food aid provided to the Government and sold through the public rationing system generates counterpart funds in domestic currency. These funds are then directly available to finance Government expenditures. In 1978-79 16 per cent of domestic revenue was provided by these counterpart funds. Any measure to cut down food aid through increasing self-sufficiency in domestic food production is not likely to provide for a compensating source of revenue and will create a financial crisis for the exchequer.

Indirectly, aid generates revenues through the revenue income of the Government. In 1978-79, 56 per cent of tax revenues and 48 per cent of all revenues were contributed by taxes on imports. To the extent that aid was a major factor in determining the level of taxable imports, it contributed indirectly to government revenue income. A fall in aid working though a fall in imports would have an immediate impact on domestic revenue generation. To the extent that aid-financed imports contribute to the level of domestic manufacturing output, and this output generates domestic revenues, both through excise and sales tax and through direct contributions to public revenues from the state enterprises, aid flows have even wider repercussions on the domestic budget.

From a review of these basic indices of dependence it becomes apparent that employment for the rural poor, domestic revenues, development expenditure, fixed investment, imports, the balance-of-payments deficit and levels of output in specific sectors of the economy, are all directly or indirectly dependent on levels of external resource flows. If to this we add the role of aid in specific sectors to finance expansion of capacity and enhancement of services, aid would appear even more critical to the performance of the economy.

In the modern manufacturing sector, power generation and distribution, modern transport, health services, family planning, there is not a single project designed for expansion of capacity which is not funded by aid. In all these areas, which must include health and education, and upgrading of services through overseas training, as well as in the import of expatriate expertise, aid plays a critical role. Current domestic revenues could perhaps run available infrastructure and social services but could afford few resources for expansion of capacity. Where particular operational facilities are contingent on imported spare parts and services for maintaining operational efficiency, aid constraints could affect even ongoing services in most sectors. Currently, aid programmes are even financing projects for institutional improvement such as the Integrated Rural Development Programmes, as well as paying salaries of family planning workers and school teachers, and teaching aids in the educational sector.

It would appear that any sudden suspension of aid or even an appreciable decline in its availability would have far-reaching consequences for the economy, society and polity of Bangladesh. We have seen that significant segments of the urban and rural populations now depend on aid for their employment, income and consumption. Virtually every area of Government activity in relation to revenue generation, development, external trade and provision of goods and services, is now contingent on aid availability. Bangladesh, in consequence, is as integrated into the world economic system as any classically dependent Latin American or African country. The policies of aid donors in the developed world, specific not only to aid but to decisions affecting the production and the pricing of commodities imported into Bangladesh, for example foodgrains, cotton, soyabeans, petroleum products, fertilizer and steel, are of growing consequence to a rising proportion of Bangladesh's population. This factor gives policy makers abroad an unusual measure of leverage over countries such as Bangladesh, and drastically abridges Bangladesh's autonomy of action in matters of domestic policy, investment priorities, choice of technology, and programming of its development expenditures. In each area its decisions have to be tailored to the ideological predilections of donors, the types of aid provided, and the terms on which it is made available.

IN THE concluding part of this paper we shall briefly discuss the systemic constraints which have contributed to this crisis of dependence within Bangladesh and the economic, social and political consequences which flow from this particular pattern of linkage with the world economic system.

Bangladesh's dependence on aid is not a new phenomenon and, in fact, has progressively increased over the years. Its dependence is tied into the compulsions of demography, geography, history and politics. Bangladesh inherited a situation where the size of its domestic population and its rate of increase was juxtaposed against acute scarcity of cultivable land and natural resources.

This unfavourable environmental situation could have been compensated by a systematic attempt to optimize available resource use. More productive use of available external assistance could have enabled Bangladesh to move to a higher threshold of productive activity from which it could cope with the mounting pressure of population. At a time when other countries were moving towards independence, however, Bangladesh's emergence in 1947 as part of the independent nation state of Pakistan was characterised by a form of internal colonialism practised by the Pakistani-based ruling elite. Monopoly of state power to the exclusion of Bangladesh was used initially to divert Bangladesh's export surplus to finance the industrialisation of West Pakistan. By the 1960s, when this surplus had been exhausted, the rising volume of aid designed to cover Pakistan's external resource deficit was channelled towards financing West Pakistan's development. As a consequence of this incapacity to utilise Bangladesh's own resources and subsequently to derive an equitable share of external aid, Bangladesh faced economic stagnation which helped to accentuate its inherited environmental and structural problems which had constrained its development capacities.

At liberation in December 1971, Bangladesh inherited an economy where external dependency on food had increased, its external resource gap had widened, the number and proportion of landless peasants had increased. Along with the incidence of rural poverty, its exports were stagnating and indeed facing a decline in the world market, and its rate of domestic resource generation was contracting. Its limited capacity for self-reliant growth had thus been substantially eroded. The traumatic legacy of the liberation war with its massive visitation of death, dislocation of millions of people, damage to the infrastructure of the economy and, last but not least, the major social dislocations caused by the withdrawal of the Pakistani bourgeoisie, posed a crisis of survival for the infant nation state.

This crisis inherited as a legacy of nature, demography, history and politics, could have been confronted by a major effort in social engineering to mobilise the collective energy of the masses to share austerity and to rebuild the war-shattered economy on a drastically restructured social base. But the political leadership of the day, constrained by its political support base, was hesitant to embark on such heroic feats of social reconstruction for fear of aggravating the dislocations inherited from the war (Sobhan & Ahmad 1980). The logical consequence of this incapacity to use the dynamic of the liberation war to transform the social order was to condemn Bangladesh to a pattern of dependent development. Foreign aid became the initial source for rehabilitating the ten million refugees displaced by the war and for reconstructing the war-damaged infrastructure of the economy. The external dependence became cumulative as the food gap, the savings gap, and the revenue gap, all came to be covered by foreign aid. The incapacity to generate domestic resources owed in part to narrow margins of surplus left within the domestic economy, but it also reflected the political constraints in extracting resources from those segments of the elite groups which monopolised these resources. To the extent that parts of the aid channelled into the economy were used materially to benefit these same classes and enhance their power within the polity, the scope for generating internal resources deteriorated rather than increased over the years.

THE violent change of regime in 1975 was designed to legitimise the power of those classes which sought to institutionalise their monopoly over domestic and external resources (Lifschultz 1979). The contradictions which characterised the post-liberation regime were subsumed in the united pursuit of bourgeois accumulation and integration of the economy into the world economic system. State power was directed towards channelling a rising pool of external resources towards building up an indigenous capitalist and rural bourgeoisie. Conversely, there were few compulsions to improve the utilisation of installed capacity and to generate domestic revenues from increased output generated by increased availability of external assistance.

The consequence of this growing tendency towards a dependent development strategy was the proliferation of aid-dependent projects and of people seeking to enhance their fortunes from them. Starting from grandiose capital-investment projects at the top, to small infrastructure development projects at the village level, these came to be tied to the specific interests of particular elite groups and their need to appropriate more resources to enhance their power base. As a consequence, it was rare for any autonomous development initiative to emerge which was not underwritten by state patronage from above and by external resources mediated through the local administration and local power-brokers who provide the base of the ruling party. This strategy seems destined to perpetuate a nation of consumers, and a system which destined to perpetuate a nation of consumers, and a system which disproportionally rewards those with access to power at the expense of those who actually work. The system therefore carries certain built-in disincentives to sustained productive effort, internal resource mobilisation, and reduction in external dependence.

This systemic crisis of dependence is likely to perpetuate Bangladesh's image as an 'international basket case'. Special appeals designed to emphasise its 'least-developed' character and distinctive status among developing countries are likely to reinforce the symbioitic links between aid donors and Bangladesh's dependent bourgeoisie. The enhancement of the power of this class as a direct consequence of growth in the aid regime is likely to make it less inclined to surrender part of its surpluses, so that the compulsion for aid is likely to become self-perpetuating. To the extent that this class is disinclined to use its aid-induced surpluses to significantly expand productive forces within Bangladesh, the capacity for transforming a parasitic trading bourgeoisie into a modernising capitalist elite seems limited, and aid will continue to be needed to build up this class.

The East and Southeast Asian models of once-dependent regimes gradually transforming themselves into dynamic capitalist regimes do not appear to be an available option to Bangladesh. The progressive marginalisation of a rising proportion of the landless and land-poor rural population is projected to increase absolutely under-employment and poverty over the years whilst polarising ownership of assets and incomes distributed between different social groups. The incapacity to give a growing number of the nation's poor a stake in the development process or to enhance their levels of living and improve their conditions of life, is likely to accentuate the social tensions that already strain the polity to breaking point. The progressive marginalisation of a rising part of the population is going to make rhetorical appeals for mass mobilisation for production progressively less credible, and hence will further devalue the legitimacy of the regime in the eyes of the masses.

To the extent that Bangladesh is a relatively politicised nation, having lived through the political mobilisation and direct involvement of the masses in a bloody war of liberation, their capacity passively to accept an absolute and relative deterioration in their conditions of life is likely to be less durable than in many other developing countries. Given the relatively recent ascendancy to social power of the aid-subsidised urban and rural elites, the dominant groups not only lack social legitimacy needed to contain tension within the polity, but their very elevation is a provocation to the masses and thus a threat to the stability of the regime. The relatively limited coercive capacity of the bourgeois state to enforce its cohesion is compounded by actual and potential divisions within the instruments of coercion, which stem from the insurgent origins of these forces and the successive breaches of internal discipline and cohesion which have characterised the role of these forces in recent years. □

Nishing Women of Arunachal

KIRAN MISHRA

THE Union Territory of Arunachal Pradesh, formerly called NEFA, is situated in India's north-eastern corner bordering China with an area of 83,578 sq km. According to the 1971 Census, the population was 4,67,511, which has become over six lakhs according to the 1981 Census. In 1954 this North-Eastern Frontier Agency beginning from the western side bordering Bhutan was divided into a number of administrative divisions and given their present names — Kameng, Subansiri, Siang, Lohit and Tirap. There is a distinct topographical distribution of land in this Union Territory. The plains and foot-hills cover about 15 per cent of the total area, broad valleys, plateau and steep slopes about 35 per cent, snow-clad peaks and pastoral land about 18 to 20 per cent. This is why only 2 per cent of the reported area, that is, about 1,06,838 hectares, is under cultivation. This figure is quite low considering the fact that the people here depend entirely on agriculture for their livelihood. Lack of plain fertile land is another reason why 70 per cent of Arunachalis are engaged in slash-and-burn cultivation, locally known as *jhum* cultivation. Only 30 per cent of the households depend on permanent settled cultivation.

The climate of Arunachal is varied. Pre-monsoon rain begins early in March and goes on till the end of September. The annual rainfall varies from 1000 mm to 6500 mm. Winter is cold and damp. Snowfall is experienced in the higher regions. Lower regions are humid and temperate. Humidity even in winter months is high. Because of such varied conditions, several types of vegetation are found in this region. In the lower regions one sees clusters of trees with thick vegetation underneath. Natural flora and fauna in the hill setting add up to a beautiful colour scheme. There is a variety of evergreen forest ranging from tropical green to temperate green in the middle ranges, coniferous and alpine in the higher ranges. There is a profusion of all kinds of orchids, some of which are of rare species. Forest is the natural wealth liberally bestowed by nature upon this territory. Important timbers like hollock, hollong, mekari, bola, khokon, nahar, fir, oaks and pines are sent to the plains of Assam. The Forest Department is trying to give a more scientific orientation to this natural vegetation. By artificial regeneration method, 20,000 hectares of teak, 11,000 hectares of hollong and 1200 hectares of pine sapling have already been planted.

In 1975, the popularly elected Government of Arunachal Pradesh passed its first Bill relating to the Forest Department, known as "Constitution and Maintenance Act 1975," relating to "Anchal Reserve Forest". According to this Act "economically viable forest areas could be handed over by the anchal sumitis for management to the Forest Department." Creation of anchal forests has induced people to preserve and protect forests. Local people are becoming conscious of the economic viability of cash-crops. More and more tribes are coming to take help from the experts of the Forest Department.

The total jhum land in Arunachal is 1269 sq km There are many factors to be kept in mind while selecting a *Jhum* field for cultivation. The land selected should not have a steep slope. Vegetation cover should be thick so as to provide enough ashes as top cover. The undersoil should be fertile so as to provide good nourishment to the plants later. The jhum field should not be too far from the place of residence. When the crops are semi-ripe there is a constant danger of wild elephants damaging the crops and herds of mithun entering the fields. So, jhum fields have to be properly fenced and a constant watch kept on the crops. Burning of cut-down forest for jhum fields is mostly done at night so that insects and pests get attracted by the light and get destroyed. It has been scientifically proved that once jhuming is stopped in a particular area, there occurs an influx of insects and pests. Ash content in the earth reduces soil acidity and balances its fertility.

The tribe inhabiting most parts of the lower and upper Subansiri divisions and a small part of eastern Kameng is known as Nishing. Subansiri division, home ground of the Nishing, has an area of about 17,000 sq km. Nishing is the largest tribe of Arunachal. According to the 1971 Census its population was over one lakh, living in about 13,000 long traditional houses and spread over 1,100 villages. Most villages are small in size, with population ranging from 50 to 250 persons. Females predominate, there being 1,021 females per 1,000 males. Men have more than one wife and the number of wives a man has shows his economic and social status. Literacy level among the Nishing is poor. Only a little over 6 per cent of the population was literate and women lagged far behind men.

Besides tending to semi-wild cattle *mithun*, the second main occupation of the Nishing is agriculture. As people depend on jhum farming, it becomes necessary for a family to have as many jhum fields as they can cultivate to meet subsistence needs. Jhum fields are usually scattered and success in cultivation depends on a large family household. The role of women is crucial for culture of crops, and this is another reason for a Nishing man to have as many wives as he can, provided he is able to pay the bride price. Since each wife has her own jhum fields, the larger the number of wives the more the jhum fields and the higher the social status of the household. Nowadays in the Subansiri region a

jhum field is given up after three or four years of consecutive farming. While the men mostly reclaim the lands, burn the slashed tress and bushes and fence off the new fields, women do the cultivation work such as sowing, dibbling, weeding, harvesting, threshing, etc. Hunting and fishing are done only by men. Women gather food, vegetables, etc., from nearby forests. Men may help women in this; there is no taboo nor any strict division of labour.

In the recent past, with state-sponsored development plans, this primitive tribe, like others, has been exposed to modern techniques and methods of cultivation. As a result, settled cultivation with irrigation facilities and application of modern inputs is beginning to develop. A total of 34,007 hectares of land has been converted into permanent fields. Previously there used to be only one *(kharif)* crop in a year. Now *rabi* crop has also been introduced. State support in the form of subsidy given to convert jhum fields into permanent irrigated land has encouraged some, specially the younger generation of men, to take to settled irrigated cultivation. Indeed, settled cultivation is gaining ground. Some of these people can even be seen using plough and bullock in the lower valleys as in Doimukh region. High-yielding varieties of seeds, plant protection measures, chemicals, fertilisers, better tools have all appeared, though it may be a long time before people give up shifting cultivation altogether.

Due to efforts at modernisation, sheep-breeding farms, hybrid poultry, and Jersey cows for milk have now caught the fancy of the educated Nishing. They respond well to extension services and make efforts to achieve better results. The Nishing have also started taking to orchard cultivation. Apple, plum, pear, walnut, chestnut, orange, pineapple, guava, etc., have begun to be planted.

The busiest months for Nishing women are April to June, for most of the sowing is done during this period. Thereafter weeding has to be done constantly in one jhum field after another. August to December are the months when reaping is done. Harvested grain is stored in small huts adjacent to the long houses. It can be a single storage system for the whole household or each wife may have a separate storage hut of her own. In case there is one granary for all the wives, then either the eldest or the youngest of the wives takes the responsibility of distributing the grain to each hearth. Each member gets according to her needs. By January Nishing men start looking up the hills for flat land which in due course would be converted into a jhum field. Women get busy preparing the old plots for early paddy plantation. In this system, though the life of women revolves around economic activities and they are the main producers of income, they do not have much social standing.

Nishings have developed an interesting way of mobilising labour for agricultural work, house construction and common community works like making hanging bridges, etc. This system reduces the dependence of a woman on her husband or any male member of the household to the minimum. There are three ways to mobilise labour. These are known as Ray Yanam, Dorum Ray, Goya Ray. For agricultural work generally the procedure adopted is to send word to different households that so many workers are needed in a particular field on a particular day. If a household calls for *Ray Yanam,* then the labourers who come to work for the whole day are given a hot meal in the evening before going back home. Generally this meal consists of rice, vegetable, meat and chutney. Men, women, young and aged, all can participate in Ray Yanam. Apart from food, appung (a local millet or rice beer) is provided intermittently to those who come to participate in the collective work. In Ray Yanam there is no reciprocity involved. Generally it is called by rich households or by those who have less working hands. A woman can always call for Ray Yanam for agricultural operation on her jhum field.

Dorum Ray is a reciprocal exchange of labour. If two members from a particular household come to help in A's field, it becomes obligatory on the part of A's household to go to work in equal number when people of that particular household require assistance. Only appung is provided by the party which calls for Dorum Ray. If possible people of the same age group and sex go in exchange, though this is not a strict requirement.

Community cooperative work, such as linkage of two villages by a bridge or a road, comes under Goya Ray. Any common facility or service which is enjoyed by two communities or villages comes under it. For such community work, members go without any compulsion. The village which traditionally has been providing material would do so and the other would provide the labour. Cooperation and sharing are two distinct characteristics of these people. Because of such cooperation a thirty metre long cane-bridge can be completed in a few hours.

Many traditional crafts like weaving, carpet-making, pottery, etc., were women's preserve. Modernisation of the traditional crafts has also been taken up. The new crafts centres opened by the Government are helping to give extensive training to young Nishing boys and girls. Importance is given to traditional crafts like weaving, carpet-making, wood-carving, silversmithy, blacksmithy, cane and bamboo work. Apart from giving training to the young boys and girls, it is also kept is mind that the goods produced here have utility. During the training period, the trainees get a stipend of about Rs 200 per month. This enables the boys and girls to earn their own living while undergoing training. This income is one not based on agriculture. While interviewing some of the officials of these craft centres, it was found that not many tribal boys were willing to come and work, because craft as a vocation is not yet a very attractive proposition for them.

Due to the spate of construction work on state projects, women too have started coming out to work on them. This has helped them earn cash income apart from their own farm income. As a result, one finds a lot of new consumer items being purchased. / Major preferences is for mill-made cloth for sarong, aluminium utensils, lanterns, plastic goods, cosmetics; shoes, etc.

Under traditional jhum cultivation a village or a clan had the right of ownership over a particular area. Each member had the right of possession of his jhum field and if due to some personal problem he was not able to cultivate his jhum field, it is reverted to the village community. In this community-based system women had no specific rights. A woman could either work in her parents' jhum fields or in her husband's after marriage. If a woman preferred to remain a widow after her husband's death, she had the right to look after the fields of her husband. We have already seen that Nishing women from their childhood are real labourers, absolutely indispensable for agricultural activities as well as for household chores. Male members help them, but it is the women who do the sowing, weeding, harvesting, dehusking grain by pounding and later cooking and feeding the children. Besides jhum fields, animals like mithun are predominantly owned by male members, though some women also own these.

Women of course have their own personal property primarily in the form of *sampatti,* that is, ornaments and gifts they bring at the time of marriage and whatever they acquire subsequently. This consists mostly of beads, silver bracelets, waist ornaments, headgear, etc. If calculated in terms of dowry and bride price the value of goods exchanged between the bride's and bridegroom's households comes almost to the same amount, specially if it is the first marriage. If a man already has many wives then naturally he has to pay more for a new wife, more than what she brings by way of *sampatti.* Relatives find out the economic condition and status of both parties and bride price is settled accordingly. After the settlement, it becomes difficult to break it. If due to some problem, the settlement has to be broken, then the offending party has to pay compensation to the aggrieved party for loss of honour in the community. Marriage, among the Nishing, is the occasion when *sampatti* passes from one family to the other. It is a matter of prestige and no Nishing would like to violate this tradition. It should be made clear here that it is the mother who gives away her own ornaments to her daughter at the time of marriage. But it is the father or the brothers who generally receive the bride-price in the form of *mithun.* One or two *mithuns* are sacrificed at the time of marriage, according to the status of the family. The rest of the mithuns may be kept and used by the male members of the family to pay for a new wife. A married woman later in life may, on her own, buy a *mithun* or pigs and poultry which she may later sell to educate her children, etc. Because of the cash income available now, every Nishing woman wants to buy a *mithun* of her own.

Today, after the introduction of modern form of settled irrigated agriculture, locally known as Pani Kheti, land under such cultivation no longer reverts to the village community. It becomes the private property of the household concerned. Similarly orchard land has also become private property. There already occurs sale and purchase of such lands now. Those in Government service and educated people do buy or keep orchards in the name of their wives. It is also found that women occasionally buy Pani Kheti in their husband's or son's name. This is however true generally only the Nishing inhabiting the lower regions of Subansiri division. In the upper regions people do not believe that *maati* (land) can be sold or purchased. This is perhaps because the new 'culture' has not yet not reached these regions.

In the household, quite often each wife has her own granary. Whatever she produces from her jhum fields or from Pani Kheti land she keeps in it. Major part of the grain produced by her is used for feeding her own children and herself. The common husband can of course partake of the food cooked by her in her own hearth. The surplus grain she is free to dispose of in several ways. A part of the previous year's paddy or millet is used to feed the collective labour which she may require for cultivation of her jhum or Pani Kheti land. Besides, she may occasionally have to contribute for her own long house, village community or clan functions, and feasts. A part of the surplus may also be bartered. Nowadays she also sells it to acquire *sampatti* or for her children's education. In most cases mothers interviewed by the author reported that they were supporting their children's education. Apart from giving a rough account to her husband there is no other restriction on a women's freedom to dispose of her own produce.

Almost all domestic labour is performed by her, assisted by her children, particularly daughters. This includes cooking, washing, weaving, collecting firewood and vegetables, fetching drinking water, feeding poultry, pigs, etc. Educated housewives too have similar chores to do, the only difference being that they might be assisted by some members of the household.

No doubt developmental efforts and incentives have brought about a lot of change in the Nishing community. Men are enjoying this sudden, induced change as far as their life-style is concerned. When it comes to girls or women, they do not appreciate it much. Women even now are expected to stick to their traditional way of life. With a black cloth wrapped around her waist the woman is expected to go out and work in the jhum field. If someone deviates from it she has to pay a price for it as the story of Saba Mano shows clear. (The names of the person and places given here are factitious, for obvious reasons).

Mano is a 25-year-old woman now. She had no formal education. From the upper regions where her family has a house she came to yazali about 10 years ago, in 1973. Luckily the State Government had just opened a weaving centre there. She joined the centre and learnt weaving. In 1975 a working shed was provided by the State Government. Gradually, Mano became the head of this centre. In 1977 she wanted to change the centre into a co-operative complex. This she could not do then, for some girls opposed the idea. Now once again she is making an attempt in that direction for the simple reason that thread and spun yarn have become too expensive in the open market. If the centre becomes a co-operative complex she could buy the yarn at subsidised rates from fair-price shops. This she is not able to do because of local pressures and indifference. When I asked her whether there were social workers and young teachers who could help her, she replied, "They do not like my taking up weaving as a profession". At times in the past young Nishing men had directly boycotted her, and now they have resorted to non co-operation. She had to be careful about talking to men outside her clan. She makes it a point to take one of her sisters with her when she has to go out. Though Nishing men claim that their female folk are capable of looking after themselves, yet Saba Mano has to suffer all this social stigma just because she chose to do something different.

There are many spinsters who live with their parents and work in their jhum fields. Taba's sister was unmarried and was staying with his parents. There was no social stigma attached to it. In fact girls who looked after their old parents got much approval. Yet the understanding was that one day she would get married. It was different in the case of Mano for she was quite vocal and has decided never to get married. It hurts the male ego to see a young girl running an establishment on her own. In a traditional society and more so in a tribal society, any deviation from approved norms is always initially resented.

For the first time educated Nishing boys have begun feeling insecure. They openly say: No Nishing girl will be allowed to marry an outsider. In all societies, be it old Hebrew, Hindu or American, it is taken for granted that a good wife needs to be understanding, sober, competent and economical. In the Nishing society parents mostly choose the bridgegroom for their daughter. A man so chosen may often be much older than the girl but one able to pay the bride price. Nishing women's expectations of married life were quite realistic and in this respect they fulfilled all social commitments.

All patriarchal societies in the past made sure that their women automatically adhered to the old traditions and norms and only grudgingly gave way to new ideas. Nishing women, in spite of changes, remain the repository of conservative moves and forces of Nishing society. For some of them it will take more time to get used to the idea that opportunities to go forward are awaiting their daughters. Modern education is in some measure helping the younger girls to become freer and more at ease in their attitude and life-style.

Many educated women are now going in for Government service and taking up other professional jobs, such as teaching, training, etc. As a result, conditions is being created which will affect the prevailing customs and traditions. Already the bride price of educated young girls has started showing a downward trend. The reason given by Nishing elders is that educated girls are no good to work in the jhum fields compared to uneducated village girls. Due to fall in the bride price of educated girls, some parents were quite apprehensive about sending their daughters to school. They said most of the girls got attached to boys at school and once the girl decided to go in for love-marriage the bride price, which should have legitimately gone to the parents, is usually not given by the boy's side. In some cases the parents were quite unhappy about it. It must; however, be added that some Nishing mothers showed keen interest in the education of their children including girls, although greater emphasis is still given to a son's than to a daughter's education.

To conclude, gradual introduction of new form of property relationship, opportunities for new occupations and education are creating conditions in which traditional customs and practices are becoming less and less effective. There is no doubt that in a few years Arunachal will be marching ahead and outdated social customs and practices will disappear. ☐

DISCUSSION

Press Commission Report

Discussion on the Report of the Second Press Commission — which is yet to be officially published — began in these columns (*Mainstream*, April 17, 1982) with a contribution from G.N. Acharya. This was followed by articles, by S. Viswam, A. Raghavan and R.C. Dutt (*Mainstream*, April 24 and May 1). This week we publish two contributions, one from M.K. Ramamurthi, senior Advocate, Supreme Court, and former Secretary-General, Indian Federation of Working Journalists, and the other from Meenakshi Sundaram, former President, National Union of Journalists, and an activist in the working Journalists' movement. —*Editor*

Parameters of Freedom

M.K. RAMAMURTHI

THE summary of recommendations of the Second Press Commission from which excerpts have been published in newspapers contains this conclusion in Chapter IV. 4: "No useful purpose will be served by inserting a separate provision in the Constitution on freedom of the Press as that concept is already embodied in Article 19 (1) (a) and by inserting such a provision no particular benefit can be conferred on a non-citizen like a company".

In the absence of the full Report it is not possible to say whether the Commission has come to this conclusion after examining the suggestions made by the Indian Federation of Working Journalists, the representative organisation of journalists, in its Memorandum. The IFWJ's plea for a separate Article dealing with freedom of the press was based on its overall approach to this question. It was the view of the Federation that freedom of the press in the 20th the century was not just the freedom of the owners of newspapers to publish freely whatever they choose, without prior restraint, but included the right of readers to receive full information, and the press could not claim as a part of its freedom, immunity from laws to prevent monopoly and ensure fair competition. It was the considered view of the IFWJ that freedom of the press, understood in this sense, should receive a guaranteed position in the Constitution not liable to be abridged or taken away under any circumstances — even in an emergency.

Paradoxically enough, while recommending the retention of Article 19 (1) (a) of the Constitution as it stands, the majority report of the Commission declares in Part IV. 33: "There is no reason why the services of the press should not be available to citizens for exercise of their fundamental right of freedom of speech and expression on a non-discriminatory basis subject, of course, to availability of space and other relevant considerations. A revised realistic view of Article 11 (1) (a) should permit encouragement of expression by providing not only for its protection 'after publication' but also for its 'emergence by publication'. The press Council should be empowered to look into complaints of arbitrary and malafide denial of access to the press".

It would appear that according to the majority of the members of the Commission the citizens should be able to exercise their right of freedom of speech and expression by requiring the newspapers to publish their views on a non-discriminatory basis; still a complaint of arbitrary and malafide denial can be made only to the Press Council and not to courts! And how can such a right be attributable to the guarantee under Article 19 (1) (a) if a complaint can be made only to the Press Council, after that body has been invested with powers to go into this question, and not be enforceable by courts?

Such inconsistencies could have been avoided by the Commission if it had properly understood the implications of the recommendations it has made in Chapter X. 34 while dealing with the delinking and diffusion of ownership and control. The Commission says: "Freedom of the press is not merely a professional right that inheres in journalists. It is essentially the reader's right to know. As William Barnest Hocking put it in *Freedom of the Press* (1947), "The phrase 'freedom of the press' must now cover two sets of rights and not one only. With the rights of editors and publishers to express themselves there must be associated a right of the public to be served with a substantial and honest basis of fact for its judgements of public affairs. Of these two, it is the latter which today tends to take precedence in importance."

If this is the concept of freedom of the press which the Commission accepts, then there is no reason why it could not have been spelt out in the Constitutional guarantee embodied in Article 19(1)(a). Failure to accept this logic has rendered many of the acceptable recommendations made by the Commission constitutionally vulnerable. It has recommended the introduction of the price-page schedule in the face of the decisions of the Supreme Court declaring previous laws enforcing it to be unconstitutional as violating the constitutional guarantee of freedom of the press contained in Article 19 (1)(a) of the Constitution, While making the recommendation, being conscious of these Supreme Court decisions, the majority of members of the Commission seem to think that any new legislation embodying the price-page schedule may be given effect to by having the Supreme Court review its earlier decision in Sakal Newspapers case in the light of the new arguments which, they think, had not been considered by the Supreme Court while deciding the case.

Equally, the recommendation for a law insulating the press from the dominating influence of other business interests, though most commendable, is likely to face the same fate as the price-page schedule unless a new concept of freedom of the press replaces the existing one. It is well to remember that under our Constitution, freedom of the press can be abridged or taken away only within the narrow limits prescribed under Article 19(2).

The Supreme Court has observed in the Sakal Newspapers: "It may well be within the power of the state to place in the interest of the general public restrictions upon the right of a citizen to carry on business but it is not open to the state to achieve this object by directly and immediately curtailing any other freedom of that citizen guaranteed by the Constitution and which is not susceptible of abridgement on the same grounds as are set out in clause (6) of Article 19. Therefore, the right of freedom of speech cannot be taken away with the object of placing restrictions on the business activities of a citizen. Freedom of speech can be restricted only in the interest of the security of the state, friendly relations with foreign states, public order, decency or morality or in relation to contempt of court, defamation or incitement to an offence. It cannot, like the freedom to carry on business, be curtailed in the interest of the general public".

The Court proceed to state: "It is argued that the object of the Act was to prevent monopolies and that monopolies are obnoxious. We will assume that monopolies are always against public interest and deserve to be suppressed. Even so, upon the view we have taken that the intendment of the Act and the direct and immediate effect of the Act taken along with the impugned order was to interfere with the freedom of circulation of newspapers, the circumstance that its object was to suppress monopolies and prevent unfair practices is of no assistance."

In spite of the categorical statement of the law made by the Supreme Court, the majority of the members of the Commission have chosen to make recommendations for introduction of the price-page schedule and for a law for delinking the press from business interests, without suggesting corresponding changes in the concept of the freedom of the press guaranteed under Article 19(1)(a) because of the mistaken belief, as set out in paragraph IV.20 that "there is a wrong notion that apart from the reasonable restrictions that could be imposed on the freedom of the press under Article 19(2), there can be no interference in the exercise of that freedom". Unfortunately, this notion is not wrong but is based upon a series of decisions of the Supreme Court starting from Ramesh Thapar's case delivered in 1952. It is because the majority of the members of Commission have chosen to assume that restrictions other than those contemplated by Article 19(2) could be imposed, that they have fallen into the error of making these welcome recommendations without redefining the concept of the freedom of the press guaranteed by the Constitution. □

Freedom, Funds, and Control

L. MEENAKSHI SUNDRAM

THE recommendations of the Press Commission headed by Justice K.K. Mathew have belied the great expectations of the journalistic community. They are like the proverbial curate's egg. Even before the report was signed the dissenters leaked their recorded views to the press to confuse the reading public, and the whole thing has become murky. The Government of India should release the full report early, so that there will be a public debate on the reasons given by the majority for its recommendations. From the published excerpts it is clear that the majority has ratified the actions of the Government during Emergency.

Briefly stated, the majority recommendations relate to the setting up of a Newspaper Development Corporation to ensure growth of the press; levy of newsprint cess and advertisement tax; enactment of a Freedom of Information Act to provide right of access to Government information; greater say for editors; price-page schedule; fixing of news-advertisement ratio; delinking of big newspapers from other business; modification of the Official Secrets Act; right to privacy; guidelines to determine what is public interest; right of journalists to keep sources of information confidential; liberalisation of defamation law and the Contempt of Courts Act; right of pre-censorship; justification of interception of mail by the P & T department; prohibition of advertisements exploiting women; non-inclusion of Freedom of Press in Article 19(1)(a) of the Constitution; penal powers for the Press Council; and so on.

On the whole, the majority recommendations will please the Government. The 'free press' in India is more a fiction than a fact. For the owners, freedom of the press means the right to propagate their ideas and to promote their business and political interests.

The First Press Commission, appointed in 1952, submitted its report in July 1954. Between then and now, the newspaper industry has moved from the bullock-cart age to the electronic age, with big business entrenching itself firmly in the industry, and many newspaper establishments have the dubious distinction of having unceremoniously sacked or forced out several eminent editors and assistant editors. In many cases, however, editors continue to be 'literary agents' of proprietors, broadcasting their master's voice and writing 'proprietorials'.

The print media now have concentrated groups of educated people to fuel their development. The rapid increase in urban population has aided newspapers' steady growth. The growing population in urban areas and the emergence of new cities and urban agglomerates at the expense of the rural areas have benefited the print media. Despite the advent of Doordarshan and commercial broadcasting, seven major industries — textiles, electronics, automobiles, tobacco, publishing, foods, and hotels — which also control newspapers, provide all national advertising in major newspapers. The top twenty newspaper undertakings operate within an inter-locked corporate form, controlling over 80 per cent of the total circulation, and this underlines the importance of economic and/or political gain and profitability as relevant yardsticks of success. They have no other motive, and public accountability is alien to them. Their cupidity has no limits. Truth is what they prescribe for others, not for themselves. These big newspapers have quite a few skeletons in their cupboards.

The press in India, by and large, has not understood its real role. It is said that the press should play an 'adversary' role vis-a-vis the Government. But many newspapers, during Emergency, when they were asked to bend, crawled before the powers-that-be. Barring some newspapers, the press proved servile. It is not yet clear whether the Press Commission went into these aspects in detail to provide a historical prespective.

Freedom of the press does not mean what the newspapers want the readers to know, but what the readers want to know and have the right to know. In the words of Justice Brandeis of the US Supreme Court, it is the public's right to know rather than the journalist's right to publish, which is the root of freedom of speech and expression. The big press in India makes fitful gestures to demonstrate fairness. Some newspapers have in-house critics, but their criticism has no lasting effect. This self-criticism is similar to that of a monkey picking lice off its body. It gives some relief to the monkey but it does not change the ways of the animal. Journalists must realise that their profession is not an easy one. No amount of outside protection will help them. Freedom must be exercised by journalists despite criticism, even under threat. There should be freedom to communicate without prior restraint, and citizens must secure the right to know, if democracy is to function effectively. Journalists are only instruments to help citizens exercise this right.

It is not clear from the published excerpts whether the Mathew Commission studied carefully the financial structure of the newspaper industry. The Commission may in effect be deemed to be the third one. The second Press Commission headed by Justice P.K. Goswami had to go when its formal resignation was promptly accepted. In between the Rajadhyaksha Commission and the Mathew Commission, several bodies like the wage boards, the wage committee, the Small Newspapers Inquiry Committee, the Mahalanobis Committee, the Monopoly Commission, the Fact-finding Committee on the Economics of newspapers, and the National Wage Tribunal studied different aspects of the newspaper industry. From the published reports, one is constrained to conclude that the Mathew Commission may not have gone into newspaper economics in detail.

As one who has critically studied the financial base of the newspaper industry, I can say that the progress of the industry has been phenomenal. Table 1 relates to the top 10 newspaper establishments, which are: Bennett Coleman, Hindustan Times, Kasturi & Sons, Express group, Ananda Bazar group, Statesman, Free Press Journal group, Saurashtra Trust, Jugantar, and Amrit Bazar Patrika.

The increase in paid-up share capital was mostly due to issue of bonus shares. Secured loans and fixed deposits, which were considerable, are from banks and the public respectively. In short, deve-

Table 1

(Rs in lakhs)

Year	*Share capital*	*Net worth*	*Fixed assets*	*Gross revenue*	*Reserves*
1953	199.31	424.70	387.36	774.05	225.39
1967*	347.76	848.56	1,441.37	4,035.76	500.80
1978/79*	402.83	1,639.97	3,716.07	10,203.56	1,237.14

(_*Jugantar and Amrit Bazar Patrika not included as figures were not available._)

1978/79	929.09	2655.95	14815.58	4762.71	1145.47	842.47	1726.86

lopment of the industry was mainly due to use of public funds and the efforts of the employees. The public and the employees have a right to have a say in the administration of the newspaper industry. It should not be the close preserve of share-holders.

There was a minute of dissent appended to the report of the first Press Commission and that was confined to a narrow compass. Acharya Narendra Deva, A.D. Mani, M. Chalapathi Rau and Jaipal Singh expressed their dissent in regard to the scope of Article 19(2) of the Constitution, the Press and Objectionable Matters Act, Sections 108 and 202 Cr. PC. For a proper understanding of the majority and minority reports of the Mathew Commission, it will be relevant to recall the recommendations of the first Press Commission suggesting amendment or introduction of new legislation. The first Commission recommended that the newspaper and periodicals industry be brought within the list of industries under the control of the Union Government. It said law should be passed to regulate the industry which should inter alia provide for the following matters: (1) appointment of Press Registrar both at the Centre and in the State; (2) collection of statistics of the newspaper industry; (3) fixing by Government from time to time, of a price-page schedule; (4) definition and punishment of practices which are unfair and restrictive; (5) laying down the manner in which the accounts of different enterprises shall be maintained by a proprietor controlling more than one newspaper or publishing them from more than one centre; (6) making the issue and publication of fraudulent advertisements punishable; (7) prescribing the method of assessment and distribution of profits from the industry, including payment of bonus to employees; (8) making it compulsory for newspapers to publish periodically a statement of ownership and control in the form prescribed; (9) new enactments for establishing a Press Council; bringing into existence a State Trading Corporation for dealing in newsprint and for furnishing finances for the operation of the Press Council; establishing a public corporation to take over the Press Trust of India; defining the powers, privileges and immunities of legislatures; amendment of the following legislation on the lines suggested by the Commission in the case of the Press and Registration of Books Act — the Drugs and Magic Remedies (Objectionable Advertisements) Act; the Post Offices Act; the Indian Penal Code (repeal of Section 124A, addition of a new Section 124B, amendment of Sections 153A, 295A, and 499); Criminal Procedure 99A, 198* and 202*); the Sea Customs Act; and the Indian Telegraph Act* not accepted by the minority).

The Mathew Commission recommendations are silent on many matters like the definition and punishment of unfair and restrictive practices; prescribing the method of assessment and distribution of profits from the industry; establishment of a public corporation or corporations to take over the news agencies; and defining of the powers, privileges and immunities of legislatures.

The dissenters' opposition to the price-page schedule cannot be sustained now in the light of the changed conditions in the industry. The Supreme Court, in the *Sakal* case, struck down the price-page schedule as violative of Article 19(1)(a). It accepted the immediate danger theory put forward by the petitioners. The petitioners contended that if the price of newspapers was raised even by a paisa, the circulation would fall, resulting in fall of advertisement revenue and consequent closure of business, and this violated Article 19(1)(a). These 'fears' were proved wrong subsequently. *Sakal* itself later nearly doubled its selling price without any appreciable increase in the number of pages. The circulation did not fall, but zoomed. This has been the case with other papers also. The *Sakal* decision of the Supreme Court needs review. The present price structure of language newspapers is such that in their case the selling price not only covers the cost of newsprint, but leaves sufficient margin to cover other expenses, making advertisement and job revenue a profit. In the case of English language newspapers, the cover price meets almost the cost of newsprint. The industry is planning to increase the prices further in the near future. Therefore, the introduction of price-page schedule will not only ensure fair competition but will prevent further growth of monopoly conditions.

The same owners' views and interests being propagated by a newspaper from 12 different centres is definitely harmful, if expression of a plurality of opinions is thereby prevented. Under-cutting is a common feature in the newspaper industry. The same newspaper, published from different centres, is priced differently, though the number of pages is the same. Should this be allowed? It is too late for newspapers to contend that they must be left free to determine the prices. The only point that should be ensured is that the growth of revenue is not curtailed. Readers should be ensured a fair return. The cost of production will come down considerably with the introduction of photo and electronic typesetting and offset printing. Let the newspaper owners publish any number of pages, but the size should be related to the price. Newspapers after all sell space — partly to advertisers and the balance to readers. In this pricing system, there should be an element of fairness. The Mathew Commission has only recommended the introduction of a price-page schedule, and said that the schedule should be worked out by an expert committee *after taking note of the economics of newspaper publication.*

The Mathew Commission has suggested fixing a news-to-advertisement ratio of 60:40 for big newspapers, 50:50 for medium newspapers and 40:60 for small newspapers. The Press Registrar has defined big newspapers to mean newspapers with a circulation of over 50,000 copies; medium, 15,000 to 50,000 copies; and small, below 15,000 copies. Small newspapers generally publish four pages priced at 40 paise per copy. They get imported newsprint. They consume one kg of newsprint per copy in 40 days, getting Rs 16. Allowing a sales commission of 30 per cent, the net income per copy for 40 days will be Rs 11.20. With the cost of newsprint at Rs 7 per kg, they get a clear margin of Rs 4.20 per copy in 40 days. In addition, under the new recommendations, they will get several facilities. If the ratio is fixed, small newspapers will become advertisement sheets inasmuch as 19.2 columns out of 32 columns will be devoted to advertisements. Mast-head and headlines will take away much space, leaving only a small position for news. There is no guarantee that if the advertisements to big newspapers are restricted they will automatically go to the small and medium newspapers. The fixing of news-to-advertisement ratio is a futile exercise.

The Mathew Commission has said there is no need to amend Article 19(1)(a) to include freedom of the press specifically. At a recent convention in New Delhi, the Minister for Information and Broadcasting, Vasant Sathe, said the Government is not opposed to amendment of the Constitution to include freedom of the press specifically. The First Amendment of the US Constitution specifically prohibits the making of any law abridging freedom of the press. Under our Constitution, reasonable restrictions can be imposed. Even the US Supreme Court, despite the First Amendment, was willing to, and did, curb 'dangerous', 'seditious', 'subversive', 'prurient', 'obscene', 'libellous', and several other undesirable modes of expression. That being the case, it is unfortunate that the Mathew Commission has chosen not to recommend amendment of the Constitution for specific inclusion of freedom of the press.

One of the major recommendations of the Mathew Commission is that the "press must, in public interest, be insulated from the dominating influence of other business interests". Are not our politicians businessmen? Why should business interests alone be curbed? Why should political interests be excluded? This insulation cannot be done overnight. In any event, this recommendation taken as a whole is self-contradictory. The Commission also says it is in favour of statutory limiting of the 'interest' (shareholding included) of persons with other business to 10 per cent of the 'total interest involved in the publication' of a newspaper. At the same time newspaper publishers are to be required to limit their interest in other businesses to 10 per cent of their interest in their own newspapers. Implementation of the proposal in the form recommended will only open Pandora's box. Why should this arrangement at all be allowed? Newspaper owners should not be allowed to divert funds from the newspaper business to other business enterprises, that is, non-newspaper activities. The funds of the newspaper business should be used only for the development of newspapers. Newspapers should be free from any type of domination by other interests.

The solution suggested by the Commission to insulate the newspaper from business influence is that the editor should be vested with ultimate responsibility for its production. It proposes statutory 'interposition' of a Board of Trustees between the management of a large daily newspaper with a lakh or more circulation, and the editor. The dissenters have opposed the whole idea. They are not alone, *The Hindu*, for example, has reacted strongly against the proposal for a Board of Trustees. It says in an editorial (April 8, 1982): "The recommendations seems to flow from the facile thinking that the editor is in all cases a man of superior integrity and judgement who needs to be protected from the meddlesome publisher with an axe to grind. Indeed the actual position in the newspaper world is vastly different, with the two working in close unison and conflicts being the exception rather than the rule. The interposition of outsiders on a board of trustees, far from promoting a balanced and proper relationship, may well become the starting point for new conflicts and misunderstanding between the two key decision makers in a newspapers". The experiment of a Board of Trustees in *The Statesman* did fail miserably. The Board was unceremoniously sacked.

Any dispute between the editor and the proprietor, according to the Mathew Commission, would be umpired by a Board of Trustees. *The Hindu* of Madras might not have had the experience of sacking an editor, because the owner himself is a working editor. But in the newspaper world, sacking of editors is a common feature. In some newspapers, a change of Government results in a change of editors. This proposal of the Commission should be debated further in a proper forum by professional organisations and others interested in the press. The aim should be that once policy has been clearly laid down in writing, how the policy is to be implemented should be determined by the editorial staff. The editorial department should be autonomous. The editor is only the first among equals. He should be guided by a staff council consisting of senior journalists of 10 years standing in the professsion. Instead of a Board of Trustees, the Press Council may be asked to umpire any dispute after ascertaining the opinion of the staff council. Till the Press Council pronounces its decision, the editor should not be changed. If the proposal of the Commission is implemented in the present situation, there is every possibility of newspapers circumventing it. Owners of big newspapers having a circulation of one lakh and above, can conceivably take steps to bring down the circulation to less than one lakh by raising the price of the paper sharply. The loss of revenue due to fall in circulation will to a large extent be offset by the price increase. At that price they can publish more pages to accommodate more advertisements. These practices were a common feature in the past to get more newsprint.

Another important recommendation relates to the right to information about affairs of state. Invasion of the privacy of the citizen should be guarded against. The Press Council Act should be amended so that newspapers would show 'respect for privacy' while publishing reports. At present the prohibition only covers reports offending 'public taste'. The Commission feels that sensitive private facts relating to a person's health, private behaviour, home life or personal or family relationships should not be published, except where it is in public interest to do so, if it would cause distress, annoyance or embarrassment to the person concerned. To determine what is in public interest, the exceptions listed in Section 499 IPC (defmation) should be the guide.

Reports touching on the privacy of a citizen could be permitted in the case of a public servant insofar as they pertained to his precise public functions.

Enactment of a Freedom of Information Act should be welcomed. Such legislation exists in Britain and the United States. The Reagan Administration has taken steps to amend the Freedom of Information Act to enable Government to withhold information and make it harder for people to obtain it. It only shows that no Government is willing to function openly. Withholding of informotion about affairs of state will only undermine democracy. Gag on officials, as in Tamilnadu, is equally obnoxious. Ours is an open society, and there is also a place for secrecy. It is hoped the Government will accept this recommendation of the Commission.

In the United States, there is a Privacy Act, but that Act provides safeguards for an individual against invasion of personal privacy by Federal agencies. The exceptions given in Section 499 IPC list what acts will not constitute defamation. Imputation of truth which public good requires to be made or published; public conduct of public servants; conduct of any person touching any public question; publication of reports of proceedings of courts; merits of case decided in court or conduct of witnesses and others concerned; censure passed in good faith by persons having lawful authority over another; accusation preferred in good faith to authorised person; imputation made in good faith by person for protection of his or others' interests; and caution intended for good of person to whom conveyed or for public good — these are the listed exceptions. It will be advantageous if there is a separate enactment on privacy.

Newspapers have a special role to play in relation to public good. Personal life and political life of politicians and businessmen are so intermixed that in many cases they cannot be separated. In such cases it will be difficult for a journalist to perform his duty in the absence of clear provision in law. It should be made clear that a public official or even a public 'figure' should not be entitled to damage unless he or she proves actual malice, that is, proof that the defamatory statement was made in the knowledge that it was false or with reckless disregard of whether it was false or not, which, rather than simple truth or falsehood, should be made the test. The media should not be subjected to either civil or criminal liability for disseminating accurately any data that are available from public law enforcement records.

To conclude, there should be a full debate on the recommendations of the Mathew Commission and on the minority note.☐

US Policy towards Cuba

Perspectives and Consequences

ASH NARAIN RAY

RONALD Reagan's installation at the White House and the intensification in the civil war situation in El Salvador allegedly aided and supported by the Cubans added a dramatic element to the already complex political situation in the Central American region.

The provocative statements made by the US State Department and other top level officials left no one in doubt that the US was set for a tougher line towards Cuba. Since the Presidential inauguration, hardly a week goes by when some official does not adopt a new get-tough policy posture against Cuba. Although Reagan says that the US has no plans to militarily intervene anywhere in the world including Central America and the Caribbean, recent statements of US Secretary of State Alexander Haig contradict this, indicating that the US is looking for a way to flex its muscles towards the Castro regime in Cuba and the Sandinista Government in Nicaragua.

As early as February 18, 1981, Haig described Cuba as the "source of the problem" in El Salvador. This charge was renewed on February 23 of the same year when the State Department released the so-called "White Paper" which claimed that the Soviet Union and other Socialist countries were channelling arms for El Salvador through Cuba. On April 6, 1981, *US News & World Report* revealed the "Haig Plan", cataloguing a number of measures calculated to bring the Cuban leaders into line — including a possible blockade and military action.

However, a real tremor was created in political and diplomatic circles when on November 6, 1981 Haig confirmed the existence of a US plan to take military action against Cuba. Even more indicative than a verbal warning was Defence Secretary Caspar Weinberger's statement issued in the last week of November about the establishment of a new united command in Central America and the Caribbean. According to reliable sources, his announcement amounts to reorganisation of US army, air force and naval units stationed in Florida, Texas, Louisiana, Puerto Rico, Guantanamo Bay and the Pacific region areas bordering Central America. In fact, US military manoeuvres have already begun which are aimed at blockading Cuba and Nicaragua. According to a report published in the Mexican daily, *Excelsior*, US marines and some special local troops have already started

Dr Ash is a Visiting Scholar at the Cento de Estudios Internacionales, El Colegio de Mexico, Mexico City.

practising hidden night landings and withdrawals on the nearby island of Vieques, using both planes and ships.

The State Department further released in December the mini White Paper entitled "Cuban Covert Activities in Latin America", accusing Cuba of sending advisers and providing training, shelter, communication links and some financial support to the guerrilla movements in Latin America. This document charged Cuba with "destabilising directly the neighbouring governments through its large-scale military support to the Marxist-Leninist elements of Nicaragua". It further accused Cuba and the Soviet Union of "seeking to extend their influence in Latin America and the Caribbean region".

All the above charges have been denounced by the Cuban Government which, in turn, accused the Reagan Administration of looking for a way to attack Cuba and the Central American countries. *Granma*, official daily of the Cuban Communist Party, exhorted the Cuban people to "resist the overpowering, arrogant and fascist policies of the Yankee Government at any cost". About the US allegation that Cuba has 500 to 600 troops in Nicaragua as part of an action designed to establish a Marxist government in the eastern part of El Salvador, Castro, while denying the charge, asserted that "Cuba has not sent a single soldier of the special forces or any other force to Nicaragua. Cuba has never sent troops to Nicaragua. This is a big lie ... "Castro also challenged the US Government to prove exactly on what day, at what time and in which plane those soldiers were sent. The US Government has so far maintained meticulous silence on this question.

On the other hand, in recent months, the Reagan Administration has intensified military manoeuvres in the Caribbean region with the introduction of a warlike operation, "Ocean Venture 82". This includes amphibious landings at the naval base of Guantanamo. Between February 27 and March 3, the United States conducted heavy military exercises in the Gulf of Mexico and the Florida Straits in which 19 US naval units combined with units from NATO allies have participated. Since March 8, under another US military operation named "Safe Pass 82", 10,000 armed forces, 30 war vessels of countries such as Canada, Britain, West Germany, Holland and Belgium, as also 80 US war-planes have been taking part. According to *Prensa Latina*, "Safe Pass 82" operations are taking place in an area where the US rapid interventioa corps command is stationed in Tampa and Cayo Hueso in the Caribbean, both of which are close to the northern coast of Cuba. And as mentioned by the Pentagon, "Ocean Venture 82" will take place in April in which army, air force and marine units of the United States will take part.

Such military operations undoubtedly pose a grave threat to the national security of Cuba. Although the Reagan Administration has declined to disclose the nature of the US plan against Cuba indications are that the United States is bent on cutting Castro to size by making the risks to Cuba seem more costly than the advantages accruing to it out of an activist role in Central America. Cuba does not seem to be alarmed at such threatening postures and there are no indications that the Castro regime will modify in any way its present policies in Central America. Such postures on the part of the two governments are apparently aimed at precipitating a showdown. As things stand today, the United States has only five basic options in Cuba:

(i) *Direct Invasion of Cuba*: This option available to the US Administration entails considerable risk and guarantees no big gains, and therefore seems to be severely limited. Cuba has a well-trained and well-disciplined army of nearly 100,000 men and women with an almost equal number of reserves which can be mobilised at very short notice. According to reliable sources, Cuba has so far established a half-million strong militia to defend the Revolution. Given the size and morale of the Cuban army, the US, in order to crush the Cuban resistance, will need to undertake massive bombardments, including perhaps the use of atomic weapons. If this be not so, the US will need to enter into a prolonged war with Cuba without the guarantee of final success. It may be recalled that the United States used this option in April 1961 during the Playa Giron (Bay of Pigs) invasion at a time when the Cuban revolution had not fully consolidated its gains and when Cuba was not defended by such huge army and popular militia as it is today. And therefore today such a misadventure can be even a greater disaster for the US. Further, US invasion of Cuba will provoke intense reactions and condemnation all over the world, especially from the socialist countries and the Third World and inside the US itself. Above all, the Soviet Union's counter actions may lead to the Third World War. Thus, given the tremendous risks and high political costs such a course is unlikely.

(ii) *Naval Blockade*: This option is being seriously considered in the State Department in order to cut off Cuba's food and fuel supplies. But this is also full of risks and promises no tangible results. Like invasion, naval blockade would require a task force so large that other important theatres of operation, such as the Mediterranean and the Persian Gulf, will have to be suspended. Moreover, for stopping Cuban arms supply to the Central American region, the US would require to intercept Soviet vessels in international waters, which would provoke a direct naval conflict between the two super-powers.

(iii) *Effective Economic Sanctions*: New economic sanctions against Cuba could produce only marginal results since there is already a United States embargo on all kinds of trade transactions with Cuba. What the Reagan Administration can at best do is to pressurize its subsidiaries operating in other countries to stop the flow of American products to Cuba. Reagan may also try to persuade US allies to impose sanctions against Cuba. But it is doubtful if his European allies or the OAS could be so easily pressurized. •Thus, this tactic too will hardly be effective against Cuba.

(iv) *Hitting Cuba where it Hurts*: Ever since

Reagan's election the anti-Castro Cuban exile community in Miami, inspired by Reagan's get-tough policy, has started openly operating guerrilla training camps and launching small raiding parties against the island from the Florida Straits. At the end of July 1981, anti-Castro group Alpha-66 announced that it had sent six landing parties to Cuba and placed about 40 commandos on the island. Another anti-Castro group, Omega-7, attacked and destroyed the Mexican consulate in Havana on September 13, 1981, to protest against Castro's meeting with the Mexican President, Jose Lopez Portillo, at Cozumel. Similarly, US-based Radio Marti has started transmitting provocative news to the Cubans. This is very much like Radio Free Europe and Radio Liberty directed against the Soviet bloc countries. The prospects of such attempts at fomenting internal subversion are very dim, since Castro remains highly popular in Cuba.

(v) *Entering into a Political Dialogue with Cuba*: The fifth option has been advocated for long by a host of US Congressmen, businessmen and intellectuals. But, it requires a virtual reversal of Reagan's stated objective — that is cutting Castro down to size. It is argued in the circles mentioned above that Cuban-US rapprochement would serve as a web of restraints on Havana's willingness to support revolutionary forces in Latin America. The absence of normalised trade and diplomatic contacts with Cuba makes it free to pursue a whole gamut of options detrimental to US interests, that would otherwise be foreclosed. For example, Cuba has diplomatic and commercial relations with the Argentine military junta even if Castro calls it fascist. But since Argentina has not engaged in aggressive postures against Cuba, the Castro regime has also responded favourably. Therefore, Abraham F. Lowenthal, a leading US Cubanologist, suggests that Reagan's best weapon against Cuba may be a threat of peace. Such a threat of peace would reduce or eliminate the political and moral capital of Cuba's 'David' image vis-a-vis the US 'Goliath'.

This, by all accounts, is the one US option rated very low by most observers. The Reagan Administration has reversed the trend towards rapprochement with Cuba and has renewed and intensified bitterness and hostility towards the Castro regime.

An analysis of these options shows that all of them are highly problematic and risky, promising no concrete results, and they are therefore, severely limited. Since early 1981, the State Department has been dropping hints that a big plan is under way to draw a line against Cuba's "expansionist designs" in Central America. However, nothing concrete has come out in terms of action plans so far. Thus, the State Department's loud warnings to Cuba have proved to be a damp squib.

In fact, the United States is well aware of the limitations of the military options in Cuba. Its objective is not militarily taming the Castro regime but frustrating and discrediting Cuba's revolutionary model and isolating Cuba from the rest of the hemisphere. The apparent contradictions in the statements of different officials are motivated by intentional ambiguity which are designed to worry the Governments of Cuba and Nicaragua and to intimidate them into discontinuing or reducing the general activist policy in Central America and the Caribbean.

The present policy, like six previous US Administrations' policies, is based on the erroneous assumption that Castro can be made to budge by bluster. On the contrary, past experience shows that when pressed, Castro becomes more aggressive. He has a tremendous capacity to transform US hostility into political victories for himself. If the past is any guide, it can be safely predicted that Reagan's policies will also fail. On the other hand, they will strengthen Castro's position at home. Castro has already ruled Cuba for 23 years. The US embargo against Cuba and the policy of isolating Cuba have failed. CIA attempts on his life have met with a similar fate. The Cuban revolution has withstood US hostilities and has remained socialist and popular in Latin America and the Third World.

In sum, the US policy of considering Cuba as the "source" of all troubles in Central America is based on false assumptions. The popular discontent and the serious economic malaise in the region are rooted in the basic underlying structural problems and vulnerabilities where movements for change have been frustrated by represions, torture and electoral manipulations. As a result, where legitimate channels of redress are charged off, the popular forces tend to be pushed to extremes and take to arms. Thus, the US policy is self-defeating, since extreme poverty, deep class and ethnic divisions, endemic violence and unequal distribution of national wealth are at the root of the crisis in Central America. ☐ *(April 12)*

Quality vs Quantity

Costs of Modernizing Chinese Education

SUZANNE PEPPER

If the basic cause of the problem is diagnosed as too many candidates chasing too few seats in college, what is the remedy? The answer obviously is either to increase the number of seats or decrease the number of candidates. The turn of phrase is inspired by a recent statement from the Chinese Minister of Education, Jiang Nanxiang.

Responding to points of criticism raised by deputies at the National People's Congress meeting in December last year, the Minister agreed, as do educators throughout the country, that the competition for admission to college is being waged more fiercely now than at any time in the past. But he concluded that the reason for the competition was not the newly restored college entrance examinations. Rather it was the "extremely sharp contradiction" between the low college enrolment quotas and the vast numbers of senior middle school graduates created by the "rash popularisation" of secondary schooling during the 1966-76 Cultural Revolution decade.

In accordance with this diagnosis, which has been reached for a number of other problems as well, the Chinese are now trying to reduce that contradiction. In 1977, there were 584,000 students in China's colleges and universities. By the 1980-81 academic year, the figure was just over one million. But during that same time, also according to official statistics, the number of students at secondary level was reduced by approximately 14 million.

These statistics highlight the key difference between the strategy of educational development promoted during the now discredited Cultural Revolution years, and that being implemented by the present Administration in Beijing. The increasing number of college students by comparison with the 1966-76 period, is among the most highly publicised features of present education policies together with the new emphasis on quality. Much less visible are the costs of implementing these policies and the social assumptions on which they are based.

The preliminary diagnosis of the earlier strategy was announced in 1979. The rapid development of secondary education which actually continued through the 1977-78 academic year, was said to have "spread financial resources very thinly, and aggravated the shortage of qualified teachers". The number of students graduating from China's senior secondary schools — 7.2 million in 1979 — was also said to be far greater than the annual enrolment of the nation's colleges could ever be in the foreseeable future.

And not only had Cultural Revolution policies aimed to universalise (*puji*) secondary schooling, they had in addition sought to unify (*danyihua*) it. This was done both by downgrading the elite college preparatory schools, and also by discouraging the development of specialised technical and vocational institutions at the secondary level. The ideal then was that everyone should attend ordinary neighbourhood schools all following essentially the same curriculum to which had been added significant components of practical learning.

Quality naturally suffered with the demise of the college preparatory or keypoint schools, as they are called, and the admixture of practical learning. Similarly, the effect on quality of combining all kinds of students in the same schools and classrooms, was enhanced by the effort to create a system of mass education providing seats for as many children as possible.

In 1965, the total number of students in China's secondary schools was 14.4 million. The figure for the 1977-78 academic year was 68.9 million with an additional million enrolled in various kinds of specialised schools. The antidote, as dictated by current Chinese thinking on educational development, is to cut back sharply on secondary school enrolments, close large numbers of middle schools, and reorient those remaining in the direction of technical and vocational training.

During 1980 alone, according to official statistics, the new policy resulted in the closure of 23,700 secondary schools. The State Statistical Bureau acknowledged in its reports a decline in national secondary school enrolments totalling 10 million for the two years 1979 and 1980. By comparison with the earlier 68.9 million enrolment figure for 1977-78, however, the 55 million announced by the Bureau for 1980 indicated a decline of nearly 14 million.

The cutbacks have apparently been concentrated at the senior secondary level where enrolments for the current 1981-82 academic year are down by two-thirds compared to 1978, as reported by the intellectuals' newspaper, the *Guangming Daily* in Beijing.

The increase in technical and vocational enrolments has been nowhere near sufficient to match this reduction of general secondary schooling. Indeed, there has been no suggestion of any attempt at an immediate proportional shift of student bodies from general to vocational schools. The decision to curtail the former is being implemented separately throughout the country, in rural areas as well as in the largest cities. Enrolment in technical and vocational schools increased only from 1.2 million nationwide in 1978, to 1.7 million two years later.

Nor has there been any attempt to coordinate the reduction in secondary school enrolments with the declining numbers of that age group that will occur with the more rigorous implementation of family planning. The school-age population is already declining in some cities such as Shanghai where birth control began to be seriously promoted in the early 1970s and even earlier by some accounts. But the curtailment of secondary schooling has been immediate and has proceeded independently of this demographic trend as well as the expansion of technical schooling.

In Shanghai, school administrators interviewed by this writer in late 1980 told of a major reduction in the number of senior secondary schools planned to begin functioning there at the start of the 1981-82 academic year. As a result, according to subsequent press reports, only a little over 20,000 students or about 30 per cent of the 75,000 junior secondary school graduates in Shanghai in 1981, were allowed to continue on to the senior secondary level.

In Beijing, where family planning was not enforced as early as in Shanghai, a total of 139,000 students graduated from the junior secondary level in 1981. Only 54,000 or 39 per cent were permitted to continue their studies.

Both Beijing and Shanghai had achieved universal senior secondary education. But with the reintroduction of the secondary school entrance examinations in the late 1970s, entrance to schools at both the junior and senior levels is now governed by a system of admission quotas and minimum passing scores similar to the procedure at college level. According to regulations announced for Beijing, junior secondary graduates who do not gain admission to the next level may attend special make-up classes for one year in preparation for a second try at the entrance examinations. Those who fail a second time must leave school to "enter society" and "await employment".

A few provinces have also announced statistics on their cutbacks. The most drastic is that for Liaoning in the Northeast. Between 1978 and 1980, the number of secondary schools there was reduced from more than 3,000 to only about 600. Total senior secondary enrolment in the province had grown to 1.4 million by 1977, or 18 times the 1965 figure. By 1980, there were only 140,000 students in general senior middle schools with another 171,000 in various kinds of technical and vocational institutions.

As a result of this retrenchment, estimates announced in late 1981 showed that at most 40 per cent of those graduating from junior secondary schools in the cities are now able to continue on to the senior level. The proportion will be considerably lower in the rural areas.

In the countryside, moreover, the reductions in accord with current education policy are occurring simultaneously with the now acknowledged rising drop-out rates resulting from the changes in agriculture. Children have always contributed to the rural division of labour. But the incentives for them to participate in the family's money-making ventures are now greater than before, outweighing in many a rural family's calculation the benefits to be obtained from educating its children.

These individual family decisions are reinforced by the new emphasis on reducing collective expenditures in order to expand individual peasant incomes. Since education falls under the category of collective expenditure, this has meant a reduction in local financing for local schools. Previously, pressure from above forced the production brigades within communes to allocate proportions of their collective earnings to finance their own schools. Now the collectives have greater freedom to decide for themselves how to allocate their incomes, which are in any case declining due to the transfer of collectively-run endeavours to individual peasants.

Primary as well as junior middle schools and classes at the village level are therefore being closed and/or merged, while most communes are closing their senior middle schools.

But this trend is actually being encouraged by higher-level education authorities. They have admitted privately to foreigners that peasant boys learn most of what they need to know about tilling the land from their fathers. And that being so, local education bureaus are no longer promoting the expansion of education in areas where the existing level of agricultural technology does not require it.

The main reason usually given for the retrenchment in secondary schooling, however, is that the quality of the schools in question was "too low". In the words of one county education bureau chief interviewed in 1980, the quality of the schools set up in the 1970s was so low that many "did not deserve to exist". He was trying to explain, without much apparent conviction, why half the commune senior secondary schools set up in his county had just been closed. Another local official present at the interview later confided that many of them there disagreed with the retrenchment. But since this was now the policy, they were obliged to implement it.

The second main reason offered is that since so small a proportion of senior secondary graduates can continue on to college — only 3.8 per cent did so in 1979 — there is little point in educating so many up to that level.

The desire to produce high quality talent for college is clearly a dominant motive for the present changes at the secondary level. Hence the re-creation of the elite keypoint system which concentrates the best students, teachers, and material resources in a few of the best schools in any given locality. The main task of a key secondary school is to prepare students for college and the majority of college students are once again originating in these schools.

Lest there be any doubt as to where the resources saved through the current cutbacks of ordinary schools might be going, the Party secretary at one key middle school provided some statistics. For the two years 1978 and 1979, just after the restoration of the keypoint system, his school was allocated respectively *rmb* 50,000 and *rmb* 30,000 for the purchase of new equipment and supplies. Ordinary schools in the same city were granted only about *rmb* 5,000 each annually for this same budgetary item.

Similarly, the province of Shandong broadcast plans in early 1981 to divert 30 to 50 per cent of the building construction funds for ordinary schools to the keypoints, as part of the effort to upgrade further the quality of the latter.

The plan, moreover, is to transform all remaining non-key general secondary schools so as to provide vocational training at the senior level. Much is now made of the ratios between general secondary schools on the one hand, and the technical and vocational schools on the other. This ratio was said to be 12:1 and 5:1 respectively in the two cities of Beijing and Tianjin, and as high as 40:1 in Jiangsu province by the late 1970s. The pre-1966 ratio of approximately 1:1 was initially hailed as representing the most rational use of scarce educational resources, since graduates of general schools are said to need two or three years' training to prepare them for any kind of employment.

The reality of the plan for technical-vocational education is now considerably in excess of the goals initially proclaimed. The actual conversion of ordinary schools into technical ones was apparently never considered on a large scale. The capital expenditures and personnel changes necessary would have made this option prohibitively expensive, according to an administrator interviewed at one such specialised machine-building school in Shanghai.

The alternative, therefore, has simply been to close large numbers of general non-key senior secondary schools and transform a few into vocational or, in the countryside, agricultural middle schools. The curriculum of all remaining ordinary senior secondary schools is to be changed to include vocational courses, as directed in the "Report on Restructuring Secondary Education" approved by the State Council is October 1980.

A conservative economist would doubtless applaud so rigorous an application of the value-for-money approach that these education investment decisions represent. Sociologists and educators, who like to add other dimensions to the concept of development, tend to view schooling as something more than an exercise in manpower planning. Among other things, it can be used to help equalise life's opportunities that may have been deprived by circumstance of birth.

From the latter perspective, the social costs of the present development strategy are heavy indeed. The net result will be to narrow and sharpen the educational pyramid: a few will receive much better schooling than before; but more young people will actually be receiving less — although what they receive will presumably be of better quality. And those who are receiving less are those who had less to begin with.

The main beneficiaries are the children of the intelligentsia, or those with a college education. In China, as in all societies, they tend to pass on that cultural inheritance to their offspring. Previously discriminated against as associate members of the bourgeoisie, all bans against them have now been

BOOK REVIEW

Bangladeshi Dichotomy

Bangladesh: by Subrata Banerjee, National Book Trust, New Delhi: 109 pp: Rs 8.75

At a time when many people in this country and abroad are interested to know the cultural and historical roots of the present malady of Bangladesh, the book under review is a welcome arrival. It would be wrong to expect in a single-volume study of this small size a penetrating analysis of the politico-historical forces that have shaped the country, but the wide canvas Banerjee has used does present a holistic perspective in which to gauge the undercurrents to some extent.

Traversing the historical past from very ancient times down to the days of Ziaur Rahman, Banerjee analyses step by step the origin and growth of Bengali language, the growth of cultural nationalism, the efflorescence of Bengali literature, the Hindu-Muslim dichotomy against the background of changing social configurations and economic structures, and so on. Through these discussions, presented in simple style and readable language, an effort has been made to rationalise the most complicated aspect of Bangladeshi character, its dichotomy — coexistence of diametrically opposite trends. In Bangladesh, forces of secularism thrive alongside those of Islamic fundamentalism. It is for the same reason that the political controversy between Bengali nationalism and Bangladeshi nationalism largely remained unresolved. And herein lies the relevance of Mujibur Rahman who championed the cause of secularism and hence Bengali nationalism. If the reported alliance between the present military rulers and the dominant faction of the Awami League emerges as a viable force, the author's analysis would be vindicated.

Given the fact that cultural values play a dominant role in Bangladeshi life, the author has rightly devoted good amount of space to them. The chapter on art and architecture deserves special mention. The author's attention to details such as the changing pictorial themes on the cycle-richshaws of Dacca (p 94) is commendable. His survey of the present state of Bengali literature, theatre and cinema is also useful.

The book, however, has a few weaknesses. Banerjee has not dealt with such aspects of Bangladeshi politics as the role of the military or of foreign aid. Whatever mention he has made of these issues, he has done so more as a formality than as variables seriously impinging upon whatever is happening now in the politics of Bangladesh. It must be recognised that the power and influence of the army is as real as Bangladesh itself. The origin of this phenomenon can be traced to the liberation war following which the people in Bangladesh were not quite certain who deserved their loyalty — the leader (Mujib) or the institution (military). The history of Bangladesh ever since has shown that the dichotomy persists; popular approval of the recent military takeover would not have been possible otherwise. Banerjee should have analysed this inherent contradiction in Bangladesh democracy.

The role of external aid which has practically become an institution in Bangladesh has also not received serious attention; this factor, according to the present reviewer, has a major bearing on Bangladesh politics. The author himself has written: "Today Bangladesh has the biggest aid consortium of any country. Foreign aid, which totalled only 198 million dollars in 1973-74, reached 6,469 million dollars in 1977-78, of which 56.7 per cent or 3,666.46 million dollars were grants. Current public debt amounts to $ 2,858.2 million." (p 82) I wish the author had analysed, however briefly, the impact of the aid syndrome on Bangladeshi life: External aid has on the one hand created an elite class who has no legitimacy to rule and on the other made the Bangladesh Government dependent on the donor countries.

Partha S. Ghosh

Technology, Management *(Contd. from p. 10)*

disrupts traditional knowledge, alienates workers, undermines the confidence of local innovators and brings in a culture that in effect implies 'what is rural is bad what is urban is good; and what is Foreign is best. 'Technology import should be only to complement and supplement indigenous competence. There must be a symbiotic relationship between importing, assimilating, improving and generating new knowledge.

Labour productivity could be a good proxy for capital productivity in most industries except in some industries like chemicals, coal. petroleum. Employment is fundamental for human dignity and for income distribution. Gainful employment of every person means increased purchasing power, greater demands for goods and services, greater production and productivity.

Technology must be relevant and appropriate — to what? Public good or private profit; the needs of the rich or the poor; rural or urban: large or small industry; public or private enterprise? When such competing claims come, and particularly when it is a choice between two rights, the real test comes for the management. Appropriateness is basically technology assessment coupled with social choice. The emphasis is really on the capacity to ask the right question. Asking the right question is the best protection against being given the wrong answer. The right question is: what does one want?

Self-reliance is not self-sufficiency: It only implies an in-built perference for developing indigenous technology competence; the wisdom to use knowledge; the ability to discern and autonomous decision-making by the management.

If technology is for development of people, people must be involved in the process. A culture in which people think spontaneously of technology as a way of solving problems is a necessary medium for the growth of entrepreneurial attitude. Imagine what happens if only we could increase each person's enterprising ability, resourcefulness and productivity. Management must have a closer look at this problem. Further, if technology is for people, people must control it. Technology assessment and technology impact on society must be publicity debated before investment decisions are made by the politicians and industrialists.

The APO study clearly shows that one of the positive factors contributing to higher productivity and technology use is the attitude of the people. The Chinese people are known for their belief in hard work, entrepreneurial spirit and savings propensity, apart from their skills and experience which contribute to their higher productivity. The Japanese people's ability to seek, accept, assimilate and adapt to changing needs and circumstances; the harmonious, collective team spirit towards work; discipline and desire for a higher level of living — all contribute to productivity improvement. Contrasted to the 'other world thinking' in India, the Chinese and Japanese have an 'earthly thinking' with a desire for better living. The traditional system and values do change with greater application of technology under right circumstances and under strong political leadership as seen in Singapore.

Technology cannot be force-fed. The demand for it should be created and nurtured by the management by raising the technology absorbing capacity of the people using technology brokers, technology banks and information centres and practically demonstrating how technology helps to improve quality of life. For people, 'seeing is believing'.

The needs, demands, resources, goals and technology absorbing capacity of the three levels of large, small and cottage scale industry differ widely. Traditional industry exists based on rich empirical knowledge, age-long experience and skills, sound observation and common sense. How to weave in modern technology and management methods into this traditional tapestry to increase its productivity, reduce drudgery and provide gainful employment requires close study.

Small-scale industry has a major role to play. Certain industries that are amenable to 'farming out', 'assembly', 'sub-contracting', 'anciliary' to large industry, centralised management and decentralised production or 'net-working' have proved to be successful in the small scale sector. But this sector badly needs good management and technology backing particularly in regard to quality control, feasibility reports, technology awareness services, engineering consultancy diagnosis and guidance. With such a backing reverse technology transfer from small-scale to large-scale industry is possible.

If technology affects every walk of life, technology policy must be integral part of every other national policy — economics, commerce, industry, defence, international affairs, education, etc. Technology plans should be integrated with national plans. Integrated planning and, more important, its effective implementation, could be achieved only if the Government, industry, labour, banking and research development groups are involved at the very inception of preparing plans. The strong relationship between Government and leaders of business, banking and research that form a well-knit unitary elite has been a notable feature in Japanese success. Productivity improvement plans and targets form an integral part of economic development plans in Japan and newly industrialising countries like South Korea.

It is the job of the management to help the decision-makers in defining the technology goals, needs, policies and setting up appropriate institutions, structures and linkages for technology generation, acquisition, adaptation, transfer and utilisation of technology. Further, the management should carefully examine to improve the productivities of management of each sub-system of the total technology system. We talk about productivity of labour or capital — how about the productivity of the management itself?

Technology involves risks. Research is risk and research is done by creative minds. Management is a red rag for many researchers. The manager must ensure that the researcher is given a creative innovative environment, the necessary degree of freedom and flexibility and yet work as a part of the team to achieve the desired goal. The bureaucratic and hierarchical administrative set-up based on the principle of safety, security, stability that stifles the risk-taking capacity and the benevolent, paternalistic management should give way to venture-oriented, flexible system of management, radical in attitude and resilient to change. An administrator administers rules and regulations. A manager manages and gets things done. Finance audit should be coupled with achievement audit. The important thing is not how much grass the cow eats, but how much milk she yields.

As stated earlier, management should have technical literacy to study each system of the total technology system from the generator to the user to increase its productivity at every stage. Productivity and effectiveness of technology is not to be measured in terms of monetary returns alone. The impact of technology on employment, distribution of income, degree of decentralisation, opportunities for skilled and unskilled workers and impact on social and cultural values, attitudes and productivity gains are to be studied. The impact statement, or technology assessment, is needed not only to check what is appropriate for the present but also to judge the consequences in such a way that societal best possible technology can be chosen and supported. Technology information and technology awareness intelligence are important ingredients for management's decision-making.

An integrated systems approach to functional management has been known to contribute high quality corporate performance. A systems approach takes into account the entire panorama of corporate activity and growth of which each activity becomes a sub-system like production, personnel, technology, marketing, etc.

The style of management (participative, authoritative, autocratic, exploitative, benevolent, etc) has a great effect on productivity. Participative management style as characterised by consultation and consent, working in harmony with a systems approach is seen in the traditional Japanese Ringi system. It is a continuous education for all concerned and gives improved performance and productivity. In such a system, the 'zero defect' movement becomes a success at less cost, bringing in vigorous quality control on the production floor to reduce costs and rejection ratios.

Managing business as a family in Japanese style is different from managing a business by a family. Family management should be a positive factor where family members have received professional training and where there is room at the top for outside professionals. The interaction between management and its educational level and ability to use new technology are shown to be interrelated. A close look at the Indian traditional management, particularly those that have proved to be successful in money lending, trading and enterprising abilities, is needed.

Productivity increases result from the application of technology and management to economic activities through effective utilisation of resources, leading to reduction in cost per unit, increasing the purchasing power, employment and investment opportunities and achieving national goals through distributive justice. Equity and employment are important. To achieve this, resource allocation, product mix, production processes and technologies should be skewed in favour of the demands of the majority of the people instead of the few elite, as is happening now. Systems have to be designed for sharing of net gains of production and distributive justice that should include per capita income, minimum standards of living and quality of life, skill development, equal opportunities, etc.

The ultimate objective of all development is to provide a decent standard of living to the majority of the people and continue improving the same. This should lead to greater comfort and convenience to the people and above all a quality of life endowed with sense of values of human dignity. This can be done only through relevant technology, efficient management and higher productivity.□

Chinese Education

(*Contd. from page 32*)

lifted. Hence their children are resuming their natural place as the dominant cohort in key secondary schools and at college level as well.

The losers are rural youth whose rising drop-out rates even at the primary level are now officially acknowledged if not condoned. It is acknowledged further that the future expansion of education in the countryside must come gradually following the overall economic development of the rural sector. The earlier emphasis on worker-peasant education is now ridiculed as part of the leftist adventure in "egalitarian poverty" that culminated in the "decade of disorder".

Both during that time and before, the traditional divisions of labour were attacked in the interest of something like *social* modernisation. Expressed in terms of the ideals of that time, the declared aim was to reduce distinctions between town and countryside and between mental and manual labour. Ironically, the traditional divisions are being reinforced today as the most efficient means of allocating scarce resources in the interest of *economic* modernisation.

But while it is no longer fashionable in China to speak in terms of socialist ideals, the problems remain. "It is unthinkable to rely on such a composition of the population to build a modern nation," wrote one Chinese scholar recently in a new theoretical journal, *Dialectics of Nature*. He had just provided statistics to show what would become of the 322 million young persons now ranging in age from six to 18 years, given the existing level of educational development. Some 20 million would be illiterate: at least 133 million would have no more than a primary school education; while only 10 million would receive any kind of professional secondary or tertiary level schooling.

Arguing that quantity and quality were two sides of the same coin, he criticised the present one-sided emphasis on the latter. "We should correct this right now," he concluded, "rather than wait until future generations sum up lessons when they write history." □

POLISH GOVERNMENT SCHOLARSHIP FOR PRACTICAL TRAINING, 1982-83

Applications on prescribed forms are invited from Indian nationals for the award of 5 (Five) scholarships offered by the Government of Poland in the following subject-fields :— (i) Fisheries; (ii) Coal-Mining; and (iii) Ship-Building.

VALUE: Adequate maintenance allowance, free accommodation and free medical care when necessary.

DURATION: 6 months.

QUALIFICATIONS: (For i): Uniformly good academic record, with Master's degree. Master's degree means M.A/M.Sc./M.Tech./M.E. but not M.Phil. or pre-Ph.D. (For ii & iii): Bachelor's degree in Coal Mining/Mining Engineering and in Naval Architecture respectively.

ESSENTIAL EXPERIENCE: At least two consecutive years' teaching/research/practical experience at the college or university level as on 1.5.1982 in the subject-field selected *after* passing the prescribed qualifications. Successful completion of M.Phil./Pre-Ph.D. course would be considered as equivalent to the required experience.

AGE: Must be less than 33 years as on 1.9.1982 (Relaxation in age upto two years will be given in the case of Scheduled Caste/Scheduled Tribe candidates). Upper age limit and experience can be relaxed by not more than three months at the discretion of the Selection Committee in the case of brilliant candidates.

PASSAGE COST: Travel expenses from India to Poland and back will be borne by the candidate or his/her sponsors/employers. Subject to availability of funds, the passage cost may be met by the Government of India, provided the candidate is eligible under the rules. The rules provide that only those candidates whose parents'/guardian's income is less than Rs. 1,000/- per month from all sources are eligible. If the applicant is employed, his salary also will be taken into account. If the applicant, however, has been in full time employment for at least two years before the last date prescribed for submission of application, the salary to be taken into account for the purpose of income limit would be the applicant's salary and not that of the parents or guardian.

In case of persons drawing income from salary, the Basic Pay, Deputation allowance and Honoraria for undertaking other work, special pay, and Bonus etc. shall be treated as income.

For determining the average monthly income, the relevant period would be the last 12 complete months at the time of signing the income certificate.

NOTE: (i) Only candidates with 60% marks and above at the level of Minimum qualifications prescribed above are eligible. Where Grades are mentioned, the candidate must indicate the conversion formula adopted by the University/Institution.

(ii) Candidates who have already been abroad for study/research/training either on a scholarship or on their own are eligible to apply, only if they have been in India for at least three consecutive years after return from abroad. Applications of candidates who are abroad will not be considered.

(iii) Equivalent foreign degrees will be considered.

(iv) The candidate should possess good knowledge about India and the donor country.

LAST DATE: For supply of application forms is **24-5-1982.**

For submission of completed forms: **29-5-1982.**

NOTE: APPLICATIONS WHICH DO NOT CONTAIN POSTAL ORDER (OR DO NOT MENTION THE NUMBER AND DATE OF POSTAL ORDER WHICH HAS BEEN SENT ALONG WITH THE ORIGINAL APPLICATION SENT THROUGH PROPER CHANNEL, WHERE NECESSARY) WILL BE CONSIDERED INCOMPLETE AND WILL NOT BE CONSIDERED.

For application form and other particulars apply enclosing unstamped, self-addressed envelope (23 cm × 10 cm) and superscribing on the envelope "POLISH GOVERNMENT SCHOLARSHIPS FOR PRACTICAL TRAINING, 1982-83" to :—

This is certainly a time of trial for each one of us. Everybody will have to work hard and produce more in order to strengthen the nation. We have to make every effort to increase our production in the farms, in the factories and in whatever fields we are working. Only then will we succeed in the great task that is before us....

We are an independent nation, and we stand firm and erect in our independence. Each one of us will have to pay the price for preserving this independence...

The first thing which we have to learn from this challenge is to put an end to all those tendencies which divide us. Internal dissensions or disputes, whether they are between one region and another or between one language and another, have no place whatsoever in the circumstances of today. The national crisis demands that we should leave such things aside and think about the bigger and more important issues which face us. Therefore, I lay the greatest emphasis on the essential unity of India. We should work for the nation's progress and preserve its unity. Once the feeling of strength and unity is there, our task is easy to accomplish.

—Jawaharlal Nehru (October 26, 1962)

PRESERVING NATIONAL UNITY IS OUR PRIME TASK:
LET US FIGHT ALL DIVISIVE FORCES

President, Constitution and Democracy

AN exchange of electioneering polemics has brought to the forefront an issue of first-class significance which no party interested in the maintenance of the present democratic system, despite all its faults, can afford to sleep over.

On May 12 Indira Gandhi told the press at the Calcutta airport that the CPI-M was trying to knock together all the Opposition parties "to get a President elected who can oust me".

Two days later, Jyoti Basu, refuting Indira Gandhi's charge, said that it would be "a very bad day for India" if any President chose to dismiss the Prime Minister. Basu was reported to have added: "According to the Indian Constitution, the President was guided by the advice of the Council of Ministers as was the Governor in the sphere of the State. How can the President on his own remove a Prime Minister?"

The question posed by the West Bengal Chief Minister is legitimate; at the same time, the Constitution as it stands today has a loophole — obviously overlooked by its authors and subsequently by Parliament in the last thirty years — which can be made use of by a President on his own to dismiss and appoint Prime Ministers without offending the letter of the law. In fact, this is the subject which is being keenly discussed for the last two months and more among the Constitutional pundits attached to the Establishment and also those belonging to the Opposition. Had Jyoti Basu been posted by his party leadership or his aides in New Delhi, he would not have made that statement — unless of course it was meant to put the Prime Minister off the Opposition trail.

To understand the implications of this controversy, it is necessary to refer to the relevant sections of the Constitution:

Article 53(1) of the Constitution lays down: "The executive power of the Union shall be vested in the President and shall be exercised by him either directly or through

officers subordinate to him in accordance with this Constitution".

Article 74(1) says: "There shall be a Council of Ministers with the Prime Minister at the head to aid and advise the President who shall, in the exercise of his functions, act in accordance with such advice".

Article 75 says: "(1) The Prime Minister shall be appointed by the President and the other Ministers shall be appointed by the President on the advice of the Prime Minister".

"(2) The Ministers shall hold office during the pleasure of the President".

"(3) The Council of Ministers shall be collectively responsible to the House of the People" (Lok Sabha).

Finally, Article 85(1) lays down: "The President shall from time to time summon each House of Parliament to meet at such time and place as he thinks fit, but six months shall not intervene between its last sitting in one session and the date appointed for its first sitting in the next session".

In common parlance, shorn of judicial verbiage, all these provisions taken together mean that while all the Ministers would be appointed by the President on the advice of the Prime Minister, the President is under no such obligation when appointing the Prime Minister. The only consideration he has to bear in mind while appointing the Prime Minister or other Ministers is that collectively the Council of Ministers shall be responsible to the Lok Sabha; that means they have to command a majority in the House. Since, however, the Council of Ministers can do without calling a session of Parliament for six months, there is no way Parliament can bind the President's hand in dismissing a Prime Minister and appointing somebody else instead in that intervening period.

A near-precedent was set by President Sanjiva Reddy in 1979 when, after the resignation of the Janata Government, he appointed Charan Singh as Prime Minister. The discretion was entirely the President's and he was not constitutionally obliged to explain how he came to the conclusion that Charan Singh would command a majority in the Lok Sabha. President Reddy only offered his advice to the newly-appointed Prime Minister — not a Constitutional mandate — to test out his strength by convening a session of the Lok Sabha at an early date. Charan Singh took some time to do so; once appointed Prime Minister, he was entitled not to call a session of the Lok Sabha earlier than a day short of six months. And when he called the Lok Sabha session, he tendered his resignation on the very morning before the session met — having realised that he did not have a majority — and advised the President to dissolve the Lok Sabha and call a general election. Since he was not technically defeated in the Lok Sabha, he was entitled to carry on as head of the caretaker Government until the Lok Sabha elections were announced in the second week of January. What the Charan Singh interlude proved was that the President could on his own appoint a new Prime Minister and he could carry on as Prime Minister for six months and before the expiry of the six-month period, he could get the Lok Sabha dissolved and carry on for another month and a half (for the election process to be completed). So, for seven and a half months the President can have his own nominee as Prime Minister without the latter having to face Parliament, and all this could be done perfectly legitimately under the Constitution.

Indira Gandhi's fears that a new President ready to help the Opposition might dismiss her do not seem as fantastic or as unconstitutional as Jyoti Basu's reactions seem to make out. This is a serious lacuna which all parties having a stake in democracy should agree to rectify. It is extraordinary that after the Charan Singh episode, nobody in the Lok Sabha — neither the Congress-I nor the Opposition — thought it necessary to bring in a Constitutional amendment to ensure that the President cannot resort to patently undemocratic removal of the Prime Minister.

The Opposition in its passion to oust Indira Gandhi from Prime Ministership must not let the President act as the dictator. As the Constitution stands today, her dismissal and the appointment of a new Prime Minister would be perfectly constitutional on the President's part. In a sense this will be virtually a constitutional coup, undermining the very essence of parliamentary democracy. Those who have been loud in their denunciation of Emergency as an authoritarian step — as it certainly was — would do well to remember that Emergency was perfectly valid under the Constitution. In upholding a step as being good under the Constitution, let not democracy be destroyed. A Presidential puppet as Prime Minister may be valid under the Constitution but will cut at the very roots of Indian democracy. Let this be kept in mind as political parties engage themselves in the next few weeks in choosing a new President of our Republic.

COMMENTARY

Issues Go Underground

VIEWED against the background of persistent speculation on the possibility of postponement or cancellation, there will be much relief at the fact that elections in four States and several Lok Sabha and Assembly constituencies were held as scheduled. And viewed in the perspective of the involvement of nearly 65 million voters in the exercise, there was perhaps justification for describing the just-concluding poll as a "mini general election".

If it was indeed so, it may be both pertinent and relevant to examine whether the poll campaign reflected an awareness on the part of political parties to treat it as such and not as yet another opportunity for settling personal scores or scoring debating points. Conceptually speaking, a general election, mini or full-fledged, ought to be utilised in a democracy such as ours with a multi-party system in full swing, either to project and sell ideological platforms or to highlight performance achievements, if any. Voting is after all an exercise of choices, and choices ought to be predicated on a calculated assessment of relative merits — of parties and individuals alike. Choices need to be determined on the basis of issues, local, regional or national, which is perhaps why all political parties fulfil the formality of issuing manifestoes, which, whether read and assimilated by the electorate or not, identify their outlook and approach.

One dominant impression left behind by the campaign of the last fortnight is that issues were conveniently sent underground, and concentration instead was on competitive personality projections. To the extent that this phenomenon has by now become typical of elections in India, it may not cause much surprise, but nonetheless it needs to be taken note of if only because both the ruling party (euphemism for Indira Gandhi) and opposition parties have been equally guilty in perpetuating it poll after poll. One would have expected it to be a little different this time because two important States with a well-entrenched background of non-Congress rule, West Bengal and Kerala, were determining their political future, and because the opposition was making a bid for power in two other States. In the event, almost the same pattern of electioneering which had characterised the poll campaigns of 1971, 1977 and 1980 tended to re-assert itself.

More than this, the opposition in all the four States distinctly gave the impression of having been put on the defensive by Indira Gandhi, and instead of commending to the electorate their own good points, they became totally preoccupied with either projecting Indira Gandhi's bad points or refuting her charges against them. Indira Gandhi's was a blunderbuss of a campaign, sparing none in her way, shrieking allegations left and right, and literally storming her way through what the opposition had led the nation to believe were their citadels. But then, this has been her style for the last decade and more, and bearing as she does the heaviest cross for her party, the opposition should not have expected any less from her. Admittedly, by virtue of her being Prime Minister, Indira Gandhi has an inherent advantage over the opposition in that she can cover far more territory, but the point we are making is not that she was more aggressive but that the opposition appeared to have missed the focus of the poll, which was to establish that given the chance they would do better than her.

It was the same opposition which during the last two years of Indira Gandhi's rule at the Centre has had innumerable occasions to castigate her administration and herself, and if they had the opportunity to do so it was not for want of issues. Though they were helpless in influencing or altering Government policies, it needs to be said in their favour that they did record their protest on the floor of Parliament and outside over a number of national issues with which they were in total disagreement. Thus, issues like the promulgation of the National Security Ordinance (subsequently enacted into law), the Essential Services Maintenance Act, and more recently the IMF loan and the subtle pro-Rightist changes in industrial policy, gave them a good handle to attack and expose the Government. But if these issues figured at all in the opposition campaign strategies, they must have done so on such an extremely low profile that the national media did not think it worthy of notice.

If the Left Front Government of West Bengal has been mobilising public opinion in the last several months in favour of early elections, it was only because it was confident of bettering the Congress-I (euphemism for Indira Gandhi) at the polls on the strength of its performance in office, especially in fields like land reforms, maintenance of communal harmony and honest administration. Yet, either because of Indira Gandhi's barn-storming tactics or because of lack of imagination, the CPM was constantly placed in the ridiculous position of defending itself against charges of murderous assaults on Congress-I rank and file and sundry other matters unrelated to its record in office.

The situation appeared to be more or less the same in Kerala where too the focus of opposition electoral strategy got distorted in the face of Indira Gandhi's many-angled barbs against the CPM-led rule, and the Left Democratic Front was reduced to the position of safeguarding its ideological image rather than banking on its administrative performance.

The Lok Dal-BJP combine in Haryana and Himachal came into being on the realisation that no opposition party could humble Indira Gandhi at the hustings singly. So far so good, and perhaps there was a great deal of merit in such an assumption. The Lok Dal made no secret of its ambition to capture power in Haryana and the BJP in Himachal, and if both were serious about translating the aspiration into reality, the strategy ought to have been such as to commend themselves, their ideologies, their potential and their erstwhile performance rather than to prove that Bhajan Lal and Ram Lal were basically defectors, which after all is a fact of history with which the Haryanvi and the Himachali are fully acquainted and perhaps couldn't care less since it is part of the political psyche of the region!

No electoral alliance which makes a serious bid for power can afford to reveal the chinks in its armour, but in Haryana and Himachal we had the entertaining spectacle of the Lok Dal and BJP leadership skirmishing till the last over both seat allotments and choice of candidates. God knows there is enough in-fighting within the Congress-I ranks, and Indira Gandhi was even forced to sound a public warning against the rebels in her party all of whom she claimed to be able to identify individually and threaten expulsion.

But neither the Lok Dal nor the BJP fared any better; the schism in their leadership and ranks was of a matching quality. Nothing illustrated this better than the first election meeting in Haryana when Charan Singh and Atal Behari Vajpayee launched the alliance campaign and commissioned the services of Devaraj Urs in the bargain. Devaraj Urs was forced to defend himself in public against the charge of having brought Indira Gandhi from obscurity into limelight by helping her win at Chikmagalur, and in the process accused both Charan Singh and Vajpayee of having helped her in 1979. Vajpayee also had the mortification of listening to Urs attack the merchants and traders who constitute the backbone of the BJP!

In this context, it is also worth noting that the better part of Indira Gandhi's campaign was devoted not so much to commending her achievements in office as to establishing the point that the opposition was determined to oust her. What else are elections for? But the constant play on this theme proved so catchy that the opposition came to believe that the only issue that mattered in the elections was the refutation of her "Indira hatao" allegation. Largely because of this opposition preoccupation, the elections turned out to be a public referendum on Indira Gandhi, with every aspect of the poll turning on the personality of the Prime Minister rather than on the import of the policies pursued by her party governments.

In the long run, the heavy accent on personalities is not good tactics for Indira Gandhi or the opposition since it exposes the absence of grassroot strength for either of them.

May 18

Fall-out of Freak Weather

THE weather gods have been playing ducks and drakes all through May, with the result that in the hottest season of the year, when scorching heat and Delhi's 'loo' should normally be pushing up the mercury to an intolerable level, the Capital has been having a spell of pleasantly cool — even cold — weather. There has been rain on successive days, giving the impression of onset of the monsoon. Many with knowledge say that a weather phenomenon such as this has not been known for a century.

It would have been all right if the townfolk could just sit back and enjoy the fine weather of the last fortnight. But other concerns get intermingled with the realisation that the unseasonal rain may well play havoc both with the economics and politics of this country. And the fall-out will have to be shared by all. As for the farmers in Haryana, it is literally true that they have been weeping in desperation, with the bountiful crop they have reared being destroyed by the rain.

That the weather phenomenon has a major political impact is because of the timing — on the eve of the mini general election whose upshot is interwoven with many complexities and marginal factors. This became clear when in the midst of the hectic campaigning, Haryana Chief Minister Bhajan Lal rushed to make an on-the-spot investigation of the loss to the crops in the State. Bhajan Lal's gesture to the farmers of Haryana, offering to accept rain-soaked wheat with larger moisture content from the mandis in the course of the procurement drive, served to underline the vital role that unseasonal rains could play in shaping the political destinies of this as well as other States.

The important point is that in the crucial last phase of the mini general election, when a multiplicity of factors are being closely watched for the slightest shift in the voting balance they could cause, the ruling party is afraid that the adverse weather in May might be yet another vote splitter, at a time when even a small loss could be damaging. While in several other matters like growth of dissidence and faction fighting, resulting in mushrooming of rebel candidates, the ultimate outcome is difficult to judge, the adverse results from the freakish weather on election-eve this year could only harm the ruling party, unless the authorities are quick to make common cause in adversity with the farmer. That is why Bhajan Lal has been so responsive to the farmers' needs. But will the same concern be there after the poll?

All said, the timing of the unseasonal rains and stormy weather in the northern States this year appears ominous because of its close resemblance to the climate in the political and economic fields in the country at large. If the May phenomenon adds to this situation even marginally, it could play havoc. No less than its political fall-out is the question as to the extent of damage that the freakish weather may have inflicted on the economy. The weighty question is the extent to which the expected bumper crop of wheat will be curtailed. The hopes reposed in a bumper wheat crop have been very big indeed — it was expected to help build a food reservoir, provide a big addition to the resources with the farmer, thereby enlarging the market for several inputs like fertiliser, and consumer items such as textiles which have been languishing under the impact of recessionary conditions, and of course provide the much-needed cushion to contain prices all round. If this chain of expectations gets upset, it could very well act as the catalytic agent for a reverse-gear chain reaction. That would be a great upset for the economy and the ongoing developmental plans.

The assessment being presently made is about the extent of damage that the unseasonal rain and storm may have caused to the wheat crop in the northern States that has just been harvested and is still lying in the fields. The first round of field surveys by official teams indicates that the damage is heavy: it could be as much as cutting the wheat output by a million tonnes. The market prices are already responding to this assessment by showing a marked rise in the last few days. However, there may be a silver lining even to this unfriendly cloud. In the first place, the initial assessments have not been shown to be the last word. The good weather conditions of the last three days are giving rise to the view that part of the expected damage to the wheat crop may be retrieved if the weather returns to normal. The second aspect is that along with the harm that the unseasonal rain has done, it has also through the sidelines brought some economic good. The standing sugar crop will benefit. Short-term crops like vegetables will also benefit, while the moisture in the field is good for the next round of sowing. Above all, the rain has augmented the available hydel reservoirs and will be good for power generation. This is a key input for the entire economy, both industrial and agricultural, and improvement in this sector benefits the economy in its totality.

That reminds one of the observations of the former Irrigation Minister, Dr. K.L. Rao — a great partisan of hydel power in the old-time controversy of hydel versus thermal power — that water, even surplus water, is always good for agriculture and the economy in Indian conditions. Even when it causes floods and misery to thousands, it has beneficial side-effects in the form of alluvial soil that is left behind yielding a bountiful crop next harvest.

May 18 *O.P. Sabherwal*

Punjab's Guilty Men

NARENDRA SHARMA

The latest phase of communal tension in Punjab has caused concern among right-thinking persons inside and outside the State. Desecration of temples and gurudwaras by a few mischief-makers from either community is astounding, for, as a team of the Sampradayikta Virodhi Committee which recently visited the various centres in the State for an on-the-spot study has rightly observed, religion, history, tradition and even rituals do not provide a clear line of demarcation between Hindus and Sikhs. The desecration of places of worship has obviously been resorted to in order to provoke communal tension by extremists of either variety, they having failed to achieve their objective otherwise in that border State with a neighbour across the border who is being armed to the teeth by imperialist forces known to be inimical to the unity and integrity of India.

"Punjab seems to have been taken over by communal insanity. People do not talk, they shout and shriek. Sanity and reason seem to have no takers," says the SVC team, adding that "unless something is done to reverse the trend towards sharp communal divisions it may reach the point of no return." Moreover, a section of Akalis are already talking, though in hushed tones, of the possibility of realising their dream of a Khalistan" in the event the Centre losing grip which they think is fast happening". And they are not alone in this game, for "curiously enough they are being provided enough food for such thinking by their Hindu counterparts, the extremist Arya Samajists and the RSS, who have been talking of creating an Assam-like situation in this border State."

In retrospect, the Hindu-Sikh cleavage does not have a long history. It goes back to the early twenties when the movement for democratisation of gurudwaras was given a communal turn, mainly with inspiration from the British rulers. The fundamentalist attitude of the Arya Samaj, on the other hand, provided a handle to communal Sikhs because the Arya Samajists ridiculed and attacked the practices and personalities of Sikh Gurus.

As for the Punjab Congress, it was then dominated by urban Hindu traders; it alienated itself from the peasantry when it made common cause with the Beopar Mandal, opposed the legislation brought by the Unionist Party to give relief to the peasantry groaning under heavy indebtedness as also the taxation measures which peasants thought were opposed because they put a burden on the trading class.

More recently, the Punjabi Hindu adopted a communal approach on the language question denying Panjabi as their mother-tongue. This naturally gave the Sikhs a feeling that the Hindus disowned the language only because of its association with the Sikh religion. It goes without saying that the communal Sikhs too tended to identify religion with language. The fifties and early sixties witnessed a lot of communal tension in the State on the issue of Punjabi Suba, which appeared to have subsided after the formation of the Suba, followed by general election in 1967 when the non-Congress SVD Ministry brought the Akalis and the Jana Sanghis together to share power and go in for electoral alliances subsequently. That phase seems to be coming to an end.

The recent trouble started with the anti-Nirankari attitude of the Akalis which culminated in the murder of the Nirankari chief, Baba Gurbachan Singh, and several of his followers in Punjab, creating a fear psychosis among non-Sikhs, particularly the Hindu traders and industrialists. As the SVC observes, the failure of the administration to bring the culprits to book accentuated the fears, which have been multiplied by the later murder of Lala Jagat Narain and others in Jullundur. Besides, there have been open threats to the lives of public men opposing Bhindranwale, Dal Khalsa and extremist Akalis generally. Hijacking of the Indian Airlines plane earlier and sacrilege at temples have produced the same result. "Perhaps they were intended to do so", according to the SVC team.

Another observation of the SVC is worth noting: The administration and police are known to be not only inactive but actively communal and factional. The reason: During the first SVD Government, the Jana Sangh (now BJP) and the Akali Dal formed cells of their favourites; later, when Zail Singh became Chief Minister, he developed his own factional network. Divided among the three, the administration stands paralysed. And this has naturally made the people lose faith in the impartiality of Government agencies.

It was observed, and this is no secret in today's Punjab, that the Zail Singh-Darbara Singh feud is a major factor behind the present difficult situation. Zail Singh, both as Chief Minister and later, has tried to pander to communal Sikh sentiments with a view to emerging as the unrivalled Sikh Congress leader; it is widely believed in the State that he has encouraged Bhindranwale and Dal Khalsa, first to break up the Akalis and then to embarrass Darbara Singh. As for Darbara Singh, "the impression is that he is ineffective though non-communal".

How are the others reacting to

the situation? Loss of faith in the capacity of Government to provide protection has led to both sections backing, and financing groups of militants capable of armed confrontation. The RSS and the Dal Khalsa are the gainers.

Among the political parties, the ruling party is a divided house for lack of a clear secular orientation. Responsible Congress (I) leaders admit that their youthful cadres are divided on communal lines. At places, it has also happened that Congress (I) leaders have asked their Sikh and Hindu workers and followers not to lag behind the extremists in aspousing the cause of their respective communities.

The SVC team noted that among the Akalis and the BJP men there were some elements unhappy with these developments but they do not have the courage to dissuade the hotheads from pursuring a collision course. The logic of communal approach has taken the State to a point where the separatists are strengthened. "The leaders who brought brinkmanship as only a tactic to achieve political aims may find it difficult to return from the brink," the SVC team has said. The BJP, for instance, has been in the forefront in organising militant Hindu protests like hartals and attacks on Sikh shops following desecration of temples. The SVC team says that in a way the BJP has played the same game which the Akalis are interested in, that is, communal polarisation. Evidently the BJP is trying to use this opportunity to reclaim its lost Hindu base.

The team found the CPI to be the only party which has played a positive role by organising peace marches and rallies in Amritsar, Jullundur and Patiala. "The common people have a feeling that they are the only force for peace. Only they are not considered strong enough." The CPI (M) joined hands with the CPI to organise joint trade union peace rallies, "but the recent collaboration of the CPM with the Akalis has stunted their potential to be effective."

The silver lining however is that much of the communal tension is still confined to urban centres. The rural areas are by and large peaceful. Moreover, the Punjab peasantry, predominantly Sikh, appear to have a vested interest in maintaining communal peace, for labour from UP and Bihar come to Punjab in large numbers to help the peasants during the sowing and harvesting seasons. The Punjab peasant, it appears, would not be interested in the slogan "Dhoti topie, Yamuna par" (meaning, throw out Hindus beyond river Yamuna) being raised by extremist Akalis.

Even in the urban areas, the workers and middle class employees can still play an important role to bring back sanity; for they know what havoc communal disharmony would cause to them and how it will jeopardise their survival. Besides, there are powerful social factors like close family ties between Hindus and Sikhs described as "roti beti di sanjh" which would provide support to any movement which seeks to stem the rot that has come to bedevil life in the State.

This is not to underrate the negative factors that today appear to be predominant in the State's political life. As an informed observer of the Punjab scene put it, the credibility of not only the Darbara Singh Government but even of Prime Minister Indira Gandhi has touched a new low in today's Punjab. The observer, for instance, pointed out that after the arrest of Harsimran Singh, the chief culprit in the hijacking of the Indian Airlines plane to Pakistan, the Government was fully aware of not only the modus operandi of the Dal Khalsa but also its links all round right up to Home Minister Zail Singh. He underlined that the culprits remain at large and Zail Singh continues to head the Union Home Ministry. Moreover, as he put it, the differences between Darbara Singh and Zail Singh were common knowledge though the former would miss no opportunity to deny them.

In this context, the SVC's observations assume significance. As it has put it, it needs a lot of hard work first to defuse the situation and then develop harmony. There is a cross-section of political leaders, trade union workers, peasant and trade union leaders, middle class employers, lawyers who constitute a sizeable section and would be prepared to work for harmony. At stake is not only life in the border State but the unity and integrity of the whole country; and this should beckon all sections. Conscientious persons have to sit up and move to salvage the situation before it is too late. (*May* 18)

NOT U.K.-BORN

In multi-racial Britain today nearly six per cent of the population was born outside the United Kingdom and nearly half that percentage in the New Commonwealth and Pakistan.

About 3,200,000 were born outside the United Kingdom, of whom 1,470,000 came from the New Commwealth or Pakistan.

The figures issued are the first results of the 1981 Labour Force Survey issued by the Office of Population Censuses and Surveys.

The estimate of 1,470,000 born in the New Commonwelth and Pakistan shows an increase of 350,000 on the corresponding figure from the 1971 Census.

The number of persons born in the Irish Republic was estimated at about 580,000 — a decrease of more than 100,000 since 1971.

The survey of 85,000 households classified 95 per cent of the people in households as white.

The other main categories were: Indian 720,000; West Indian or Guyanese 520,000 and Pakistani 280,000, with about 230,000 estimated to be mixed racial orgin, of whom more than three-quarters were born in the United Kingdom and most were under 16.

About 2,300,000 people were estimated to be living in households headed by someone born in the New Commonwealth or Pakistan.

Of UK-born persons of Indian, Pakistani, Bangladeshi and African origin nearly 90 per cent were under 16 and the remainder nearly all between 16 and 29.

Sheer Folly in South Atlantic

C.P. RAMACHANDRAN

THE fighting over the Falkland Islands between the forces of Argentina and Britain is increasingly taking a Chaplinesque look. There is a lot of movement but no action. Hemingway once asked that the one should not be mistaken for the other. Be that as it may, both sides are claiming victories and admitting defeats. One Argentinian warship has been sunk which brought acclaim in jingoistic circles in Britain. But this was followed soon by the loss of a British destroyer, and that has converted jubilation into gloom. Prime Minister Margaret Thatcher seems unsure of herself and Michael Foot is presently distancing himself from those martial postures he put on in the House of Commons.

Meanwhile, the United States has made an ass of its foreign policy by declaring that it supported the faithful Thatcher Government after an earlier declaration that it was taking an even-handed approach to the problem. Haig and his cohorts did not realise that Latin American feeling is very high on the subject. Little countries like Panama are crying against British intervention. The Organisation of American States is in a state of rumpled disarray. Tin-pot dictatorships which were always keen to show they were subservient to the USA are defiantly declaring their solidarity with Argentina.

So many people are trying to find a face-saving formula. The United States efforts, so far abortive, are matched by the activities of the Secretary-General of the United Nations, Cuellar, himself a Peruvian. Nothing has happened. It is just like the Iraq-Iran war. Everybody, including the participants, is heartily sick of the entire affair. But nobody knows how to get out of the situation. Loss of face is a serious matter for nations that have very little to show for clout in the international arena.

The fight is comic. Some slight naval activity. Some bombardment of the coast. Very little air activity. A missile hits a ship. A soldier is captured and then released to welcoming crowds. The BBC is charged by the Thatcher Government with being less partisan than it should in its reportage. Even the media have lost interest in Groucho Marx fighting with brother Harpo. Even high comedy can go stale if it is too prolonged.

The new factor is the cry of Russian intervention. This is a very convenient slogan for the moment to disengage both the combatants. A Russian communication satellite is now said to have helped the Argentinians to guide a missile to a British warship and sink it. But this kind of propaganda will do no good in the end. The Russians are strictly keeping away from the imbroglio.

War, said Clausewitz, is merely another way of carrying out foreign policy. What is the present war an extension of? Argentina's claim is that the Falklands became a British possession by an act of imperialism. That is true. The British say that they will respect the wishes of the people of the islands who are of British stock and will remain loyal to Britain. That is true also. But what is the test of sovereignty? If Tibet was allowed a referendum, today the people there would reject the Chinese connection. What is the United States' justification for the naval base at Guantanamo in Cuba?

Western hypocrisy stands thoroughly exposed in the incident. Every word they have said in the past about Poland and Afghanistan is being eaten in the south Atlantic. Their professions of peace of peaceful negotiations for political settlements, their professed abhorrence of war, their opposition to conflict over non-issues, their so-called adherence to the rule of international law — all these either ignored or openly violated.

The United States has learnt one great secret. That seems to be that the use of big warships today is ineffective. The "Invincibles" are highly vincible. Britain has learnt one lesson. It is that the British lion has not only lost all its teeth but has no substitute dentures of any kind. Argentina has learnt the great truth that great generals with rows of medals (without any battles to show for them) can make asses of themselves by resorting to a political misadventure for internal reasons. The rest of the world, after a fit of laughing, is now hoping that the denouement will start before the show goes sour.

So after all, the great little war over some little islands is not without its uses after all. ☐

(May 18)

CUPID AT WORK IN CHINA

Many young people in China commit suicide because of love affairs that go wrong, reports Reuter, from Beijing, quoting an official newspaper.

An article in *The Workers' Daily* by a well-known university lecturer gave no figures but said one distraught official of a national corporation showed him a list of suicide cases in various factories, all brought about by unrequited love. The suicides were the result of "too much emphasis placed on love by young people," he added.

The lecturer said two factors were mainly responsible for this. First, the Maoist years' puritanical censorship, which resulted in films and literature completely ignoring matters of the heart. Secondly, today's films, in the relatively liberal post-Mao period, had become excessively permissive and showed far too much hugging and kissing on the screen.

Older people often complained these days of young people kissing openly in the streets — an act unthinkable during the Maoist period. The lovers explained that they had nowhere else to go.

Pretoria's New Racial Mischief

HARI SHARAN CHHABRA

THE White minority regime in South Africa, which denies all basic and human rights to the African majority, is now preparing for major political mischief. It plans to drive a permanent wedge between segments of the non-White population by winning over the 800,000 Indians and the 2.6 million Coloureds (people of mixed race) to its side and isolating the 19 million Africans, the indigenous population of South Africa.

A report by the Government-appointed Multi-Racial Council's Constitutional Committee has called for the Indians and the Coloureds to be granted equal political status with the 4.5 million Whites. It has recommended that the two groups be represented in Parliament and in the Cabinet on a proportional representation basis.

In its "wisdom" the committee has given the opinion that a single political system which would include Blacks, who form 70 per cent of the population, would not work. It however, said: "A single political system in South Africa which included the Coloureds and the Indians on an equal basis with the Whites could function successfully. In the committee's view, it is not only desirable but necessary that the Coloureds and the Indians should participate in decision-making at all levels and in all functions of the political system."

If this report is finally accepted by the racist regime, which is on the cards, it will be taking the odious policy of apartheid to its logical conclusion. This will mean ruling out for ever any place for the Africans in the Government and endorsing the current policy of separate self-governing tribal "homelands" or Bantustans. This will in reality mean that an African born in South Africa is not a national of his own country. He is a mere Bantu denied all national rights, who will either live in his tribal Bantustan or, if he has to live in White South Africa, he could merely be a domestic help or a factory worker on contract, and will have to live separated from his family.

In the ultimate analysis, the committee's report would want the White minority regime to follow a policy of divide and rule. For it lives in a world of misguided belief that by isolating the Africans it would have solved all its problems. We in India naturally feel bad that Indians in South Africa will now be sought to be utilised to strengthen the apartheid monster.

But how are the Indians and the Coloureds in South Africa going to react to these proposals? To answer this question, one has to note that there are three categories of Indians and Coloureds. Number one is a small group of people who totally support the cause of the African majority and who are either imprisoned or are fighting the forces of apartheid from self-exile. Number two is a fairly strong group, which lives inside South Africa, and is sympathetic to the idea of the one-man-one-vote rule. But the voice of this group is somewhat muffled. And in the last category come very large numbers of Indians and Coloureds who are prosperous and who are direct beneficiaries of the system of apartheid. These are the people, call them toadies if you like, who would welcome these proposals and would ask the Government to expedite their implementation. Some of them would already be dreaming of becoming MPs and Ministers.

It will be recalled that the last category of Indians and Coloureds had been clamouring for some kind of representation of their interests. The Pretoria Government then appointed an Indian Council and a Coloured Council. These were only advisory bodies with no legislative functions. Membership of these Councils was a matter of prestige for some individuals, yet the majority of the Indians and the Coloureds were none too happy with their meaningless existence. These Councils became non-starters in a way, especially the Coloured Council.

Now let us look at the position of the African majority in the so-called self-governing Bantustans. Facts will speak for themselves. Only 13 per cent of the total land area is being given to the 70 per cent indigenous majority. And most of this land is either desert or marshy or mountainous. It is devoid of all mineral wealth, of industries and of big cities. The 13 per cent land is not one contiguous piece but fragmented. As for their political status, can anyone call Transkei self-governing or independent? It is common knowledge that it is a "colony" of Pretoria. Such is the injustice that even the Black petty bourgeoisie feels humiliated living in Transkei.

No wonder, therefore, that the freedom-loving world has rejected the "homeland" policy and called apartheid a crime against humanity. There is hardly any doubt that the latest proposals for giving political rights to Indians and Coloureds and denying them to the Africans will be condemned and rejected by the international community.

To achieve their national rights Africans are now left with only one option — intensification of the armed struggle under the banner of the African National Congress of South Africa. The military wing of the ANC, *Umkhonto We Sizwe* (Spear of the Nation) has to step up its campaign of sabotage and guerilla warfare. It already has many a victory to its credit.

It is good to note that the ANC leadership has recently decided to make military struggle more effective. Thus military targets, refineries, oil dumps, transport and industrial sites have been singled out for the attention of the *Umkhonto We Sizwe*. This popular army will speak to the enemy in the language he understands.

Already, since the Soweto uprising of school children in 1976, South Africa is in the grip of agitation of all kinds. Students are in revolt and strikes have heralded a wave of workers' struggle.

Faced with all-round opposition, the Government in Pretoria is trying on confuse the situation by bringing about some reforms by way of dilution of apartheid. These reforms have met with ridicule because these are only of a cosmetic nature. The inferior status of the Africans continues and the economic system controlled by White exploiters remains unchanged.

Africans will, therefore, not rest till they have achieved the liberation of their society from the rigours of life under apartheid. Liberation for them means 'one man one vote' rule and equality of economic opportunities for the entire population of South Africa. The African National Congress is determined to win the battle.

Today, in the twenty fifth year of the Freedom Charter of the ANC, it is worth recalling that the Charter has declared that South Africa belongs to all those who live in it — Black and White — and that only the total abolition of apartheid and the redivision of wealth among all the people could lay the basis for a just and democratic South Africa. *(May 17)*

Reagan's 'START': Clever Arithmetic

S.K. SHARMA

THE announcement by President Reagan last week of US proposals for 'significant' reduction in US and Soviet strategic nuclear forces, does not really make any meaningful departure from the Reagan Administration's earlier hard-line stand. The 'Ground Zero' week of last month and the groundswell of US public opinion in favour of halting the arms race notwithstanding, the Reagan proposals (for Strategic Arms Reduction Talks) do not show any impact of popular feeling. In fact these proposals have come six months after the so-called 'zero option' was put forward by the US President in November last year. Reagan had then said, "We can make proposals for genuinely serious reduction but only if we can take the time to prepare carefully. The US has been preparing carefully for resumption of strategic arms negotiations because we do not want a repetition of past disappointments".

These six-month-long preparations, one imagines, should have included, among other things, the presentation of the 1983 military budget which has $ 23.1 billion for the major strategic nuclear programmes as against the figure of $ 8.7 billion in the previous year. There was also the proposal to meet the Soviet President in June in New York, to which the latter replied by suggesting a date in October in a neutral country. Asked how long it would take to negotiate a suitable reduction, President Reagan told a press conference, "The Soviets would feel induced to negotiate soon enough" because of his "increased military spending programme".

Broadly the proposals are: (i) In the first stage land and sea based ballistic missile warheads — 'the most serious threat we face' says Reagan — should be cut down by one-third, to equal ceiling; (ii) no more than half of the warheads should be land-based; (iii) in the second phase the US would seek equal ceilings on other elements of the strategic forces of the two countries — presumably this would include strategic bombers; (iv) the US would also seek to place limits on the throw weight or explosive power (megatonnage) of ballistic missiles in which, according to Reagan, the Soviet Union is superior; (v) in both phases there would be insistence by Washington on verification procedures to ensure compliance with the accords reached.

The author is associated with the Institute of Defence Studies and Analyses, New Delhi.

Apart from these outlines, agency reports have also carried comments by US officials. Thus the US and the Soviets are each supposed to have almost 7500 land and sea based long-range warheads, with the Soviet Union having 2400 missiles and the US 1700. The US officials also remarked that in preparing their proposals for the talks, they did not intend to 'censor' themselves by deleting suggestions which the Soviet Union was not expected to like. At the same time, the officials also believed, on the basis of their contacts with Moscow, that the Soviets would not reject these proposals outright.

Apart from the reaction of the news agency Tass, no official word has so far come from Moscow about the Reagan offer. Tass said that "the proposal does not witness the search for mutually acceptable solutions, but is an effort by the US to obtain unilateral military advantages". Just a day before Reagan made his "offer", an article by Soviet Defence Minister Ustinov in the party daily had severely criticised the US for thwarting Soviet peace plans and for "cooking up the myth of Soviet military menace" in its (USA's) pursuance of military superiority. Ustinov had declared in his article that 'the Soviet Union will not allow the existing balance of forces to be disrupted'. President Brezhnev had, earlier this month, replying to an appeal by an international group of physicians, said the Soviet Union was ready to negotiate "radical agreements" on nuclear arms control.

Let us look at the Reagan offer more closely. The President has called for reduction by one-third in the sea and land-based weapons, with the additional condition that no more than half of the total should be land-based. According to Paul Warnke, former Chief US negotiator in SALT II, the Soviets have 80 per cent of their strategic forces in land-based

ICBMs while the US has less than 30 per cent. Simple arithmetic will then reveal that if the Soviet Union agrees to Reagan's proposal, it will have to reduce, not by one-third but effectively by about 60 per cent its existing land-based missiles. The reason is that one third cut will still not make Soviet land-based missiles less than half of the remaining total, so the Soviets will have to further reduce their land-based missiles by another 30 per-cent or so. To illustrate this point let us take Reagan's figures: of the 7,500 nuclear warheads a one-third cut would mean reduction by 2500, whereas the existing Soviet land-based missiles add up to, roughly, 6000. Thus, to conform to the one half limit on land-based missiles, the Soviet Union will ultimately have to remove, in all, 4000 missiles.

Now, this would be in conformity with what the Reagan Administration has been saying all along: that the Soviet Union had an edge over the United States in its strategic force. The MX missiles programme was taken up by President Reagan because of this so-called 'window of vulunerability', presumably arising out of the Soviet land-based SS-18s and SS-19s heavily out-numbering US Minutemen. In fact the inordinate concern within the US about a Soviet first strike has been there because of this fact, and the Reagan proposals presumably seek to remove this lead. It is a different matter that not only the 'Ground Zero' enthusiasts but even former defence chiefs in the US do not accept the assertion that the Soviet Union has superiority. Both James Schlesinger and Harold Brown have recently mentioned this in their testimony before the Senate Foreign Relations Committee. The Reagan Administration does seem to grant itself, through this proposal, a "handicap" which the Soviets may not accept.

The third aspect of the Reagan offer is the proposal to seek reduction in the throw-weight (megatonnage) of the ICBMs. Here again the Soviet Union may find it difficult to accept the criterion of determining the lethal capacity of a weapon by its throw-weight only. It is true also that the ultimate destructive power (kill probability) of a weapon depends on the accuracy as well as throw-weight of the warhead. In the case of the USA the introduction of the MX and Trident D-5 systems would greatly enhance the accuracy of its missiles. For instance, although the throw weight of the MX is about half that of the SS-18, the MX incorporates the most modern technology and is expected to be more accurate than the SS-18. Clearly the same gross yardstick of limiting the throw-weight or yield cannot be applied to the strategic arsenals of both countries as a summary reduction in throw-weight would mean inequitably large effective reduction for the Soviets.

The US proposals do not give an indication about cruise missiles. According to the 1979 treaty (now discarded by both) there were limits on the average number of air-launched cruise missiles carried by long-range bombers. The Soviet Union has not so far made any comments on this aspect of cruise missiles, but the US defence plan includes the cruise missile in a big way, there being plans to place between 6,000 and 10,000 cruise missiles on long-range bombers and an equally high number to be deployed with the US Navy. A cruise missile with a nuclear warhead can be used for retaliation because of its high survivability in a first strike. According to reports, the US Administration considers cruise missiles to be stabilising weapons and therefore does not consider limiting them. The Soviet Union however may not agree to reduction in long-range ballistic missiles and bombers without commensurate limits on cruise missiles.

The question of verification remains a vexed issue. Going by the earlier experience of SALT I, each side has been suspicious of the other circumventing Treaty stipulations (SALT I, for instance) in spite of the provisions for verification of compliance by 'National Technical Means', that is, satellite and ground sensors and the Standing Consultative Commission for resolving issues. The Soviet Union, however, has shown greater faith in the efficacy of the inspection procedures, insisting that the 'national means' must have priority over any other means that can be worked out. During an interview with *Der Spiegel* last year, President Brezhnev deplored the fact that 'it is in the US that all sorts of plans are being discussed in earnest as to how inter-continental missiles could be hidden more reliably and could be placed beyond inspection by national technical means'. But US suspicions too cannot be easily removed because of the overall opacity of the Soviet system.

The difficulties in the SALT II treaty were due to the fact that the Treaty specifies equal limits, category by category and on the aggregate number of launches, whereas the number of warheads deployed is constrained only in indirect terms by putting a large maximum on the allowed warheads (that is, 14 re-entry vehicles per submarine-launched Ballistic Missile and 10 per ICBM along with a freeze on current force loadings per type of ICBM). In other words, such stipulations may serve as an incentive for developing large, highly MIRVed (Multiple Independently Targetable Re-entry Vehicle) missiles. This trend is seen in the Soviet modern missiles, namely the SS-18 with 10 re-entry vehicles and SS-19 with six, which have created concern within the US about the validity of SALT II itself and constitute one main reason why the US has not ratified the treaty. While the large size of the Soviet ICBMs make it inequitable to place such maximum limits, there seems to be a problem of verification if any more detailed specifications are incorporated.

If the Reagan offer is a preliminary negotiating stance, then perhaps after the talks begin, there may be some progress. But on the other hand, some newspaper reports suggest, the Reagan offer was made after elaborate discussion between the Joint Chiefs of Staff, the Arms Control and Disarmament Agency supported by the civilians in the Pentagon and the State Department; the final position may tend to be more rigid — especially since President Reagan has talked again of negotiating from a position of strength. It appears from these reports that

(*Continued on page 27*)

The Second Special Session on Disarmament of the UN General Assembly, due to begin in the first week of June 1982, will be held in an atmosphere vastly different from that at the time of the First Special Session in 1978. There is pervasive fear now among the populations of the industrialised countries of possible use of nuclear weapons, with obvious consequences. Apart from the massive anti-nuclear demonstrations all over Western Europe, even in the USA the people are becoming increasingly concerned, as symbolised, for example, by the new Ground Zero movement, described as a response to fear among US citizens of "the threat to their security presented by the possibility that the Soviet Union and the United States might launch nuclear weapons against each other as part of a nuclear war." The poorer nations containing the vast majority of mankind watch with dismay the escalating wastage of valuable resources that, diverted, could totally transform the lives of their peoples. Even those non-nuclear-weapon nations that signed the one-sided Non-proliferation Treaty have begun to realise the folly of believing in the theory of nuclear deterrence The disarmament talks at Geneva have got bogged down through the years, thanks to super-power rivalry. It is in this situation that the Second Special Session of the UN will discuss a whole range of crucial issues relating to disarmament, especially nuclear disarmament.

The Institute for Defence Studies and Analyses, New Delhi, has just released a special number of its monthly journal, *Strategic Analysis*, presenting "a perspective from the developing world" influenced also by the impact of non-alignment. We reproduce here one of the instructive articles from the special number (April-May 1982).— Editor

UN Special Session

Disarmament: Tortous Course

Mankind today is confronted with an unprecedented threat of self-extinction arising from the massive and competitive accumulation of the most destructive weapons ever produced. Existing arsenals of nuclear weapons alone are more than sufficient to destroy all life on earth. Failure of efforts to halt and reverse the arms race, in particular the nuclear arms race, increases the danger of the proliferation of nuclear weapons. Yet the arms race continues. Military budgets are constantly growing with enormous consumption of human and material resources. The increase in weapons, especially nuclear weapons, far from helping to strengthen international security, on the contrary weakens it. The vast stockpiles and tremendous build-up of arms and armed forces and the competition for qualitative refinement of weapons of all kinds to which scientific resources and technological advances are diverted, pose incalculable threats to peace. This situation both reflects and aggravates international tensions, sharpens conflicts in various regions of the world, hinders the process of detente, exacerbates the differences between opposing military alliances, jeopardises the security of all states, heightens the sense of insecurity among all states, including the non-nuclear-weapon states and increases the threat of nuclear war.

So proclaimed the Final Document adopted by the UN General Assembly Special Session on Disarmament on June 30, 1978. The Second Special Session, being held this June-July, takes place in more alarming circumstances than four years ago. The arms race has intensified. New weapons have joined the arsenals, military budgets have skyrocketed, and confrontation has replaced the spirit of detente. The world has become a far more dangerous place.

Currently, the arms race swallows up more than 600 billion dollars. Armaments expenditure in 1980, around 500 billion dollars, was the equivalent of the total investment in all developing countries, and nearly 19 times greater than the official development assistance provided by the Western developed countries to developing countries. It equals, to put it differently, the gross output of 340 million people of Latin America or 1.3 billion people living in Africa and South Asia.

Of this stupefying figure, the industrialised world spends around 84 per cent and the developing world only 16 per cent. And here comes a paradox. Of the 120 wars fought all over the world between 1945 and 1976, only six occurred in the industrialised world, all the rest had been fought in the developing world. The number of wars in the developing world might even be higher if the figures are computed up to 1982. Thus, most of the arms build-up and arms spending takes place among countries that have had very few wars in the last 37 years. The argument has ensued, that armed preparedness, especially nuclear, has effected deterrence among the industrialised nations, leading them to shun war. Those who speak for the arms race argue that sustained defence expenditure has ensured their security and has therefore been worthwhile. In the popular notion, King Atom has preserved peace in Europe and the rest of the industrialised world. Faced with such a perception, reversal of the arms race becomes extremely difficult.

The period 1945-1970 was also one of continuous growth and prosperity in the industrialised world; the average growth rate was 4-6 per cent and there was near full employment during most of this period. Such prosperity, which was unprecedented, went hand in hand with high defence expenditure and preservation of peace in the industrialised world for an unbroken 25 years — which again was unheard of before. The upshot of this was a general complacency that the arms race did not hurt, economically or socially, and that it could be kept in check. In such circumstances the arms race has developed a momentum, born of the stress placed on qualitative improvements in weaponry.

The emphasis on qualitative aspects of weaponry has also profoundly affected the character of the arms race. To quote the UN Report on the Relationship Between Disarmament and development.

> As the complexity of weapons increased so did the time required for development, testing and deployment. The lead time or gestation period of a modern weapon system is now of the order of seven to ten years. Each side must therefore focus its attention not so much on the capabilities of the weapons the opponent already has, but on the capabilities of those he might be able to deploy five or ten years in the future. This anticipatory process, strongly fuelled by secrecy and prudently conservative assumptions on the opponent's scientific and technological prowess, both accelerated the pace of change and intensified the commitment to military research and development. When both sides are doing the same thing there is a high probability, given even roughly comparable technological opportunities and constraints, that each will eventually produce the developments anticipated by the other. Indeed it would seem that it took only a few experiences of this kind in the early post-war years to generate the presumption in both the United States and the Soviet Union that what was technically feasible should be viewed as militarily and politically necessary.

Every category of major weapons has a life span of about 10-15 years. A completely new model comes along, incorporating new advances in technology. In combat, the marginal effectiveness of weaponry is crucial, and this is the compulsion to replace one generation of weapon or equipment with a more sophisticated successor.

New generations of strategic, theatre and tactical weaponry are replacing the earlier generations. In the US arsenal, the Mx missile is to replace the Titan missile; the Trident-C4 and D-5 missiles are to replace the Poseidon and Polaris submarine-borne missiles; air-launched cruise missiles are to improve the utility of the B-52 bombers, which themselves are in due course to be replaced by a new bomber. The Soviet Union has developed and deployed SS-20 missiles; SS-21, SS-22 and SS-23 missiles are reported to be under development to replace the vintage SS-4s and SS-5s. The United States is developing Pershing II and ground-launched cruise missiles as theatre weapons. Britain and France as well have undertaken similar modernisation programmes. The United States also has a major modernisation programme of command, control and communication at an estimated cost of 18 billion dollars. Neutron weapons and nuclear shells for use of artillery are also being added to the arsenals. The US is to produce in the next few years some 10,000-14,000 additional nuclear warheads of various explosive yields. The USSR also must be implementing similar measures.

Americans justify their new armaments programme with the argument that during 1970-1975 the Soviets added SS-16, SS-17, SS-18 and SS-19 to their arsenal while they themselves did not deploy any new missile after Minuteman III; that with the heavier throw weight, multiple warheads and better accuracy of the Soviet missiles and with a larger number of them landbased, the US landbased missile force was becoming vulnerable to a first strike; that a 'window of vulnerability' was opening and that it had to be rectified by development of the more accurate and more sophisticated Mx missile which could also carry more warheads and air-launched cruise missiles which would enable strategic bombers to deliver the warheads from a distance without having to penetrate very deeply the adversary's air defence systems.

Western Europe had lived with the Soviet SS-4 and SS-5 missiles for well over 20 years, but the new SS 20 missile was deemed to pose a threat to it. The new missile would seriously affect the strategic balance in Europe and subject it to a process of 'Finlandisation', it was said. And so NATO has decided to have 572 theatre missiles — 464 ground-launched cruise missiles and 108 Pershing II ballistic missiles — installed in Western Europe. But this brings Moscow under an asymmetric threat — of a theatre missile with flight time of only five minutes — which President Brezhnev has already warned the Soviet Union will not accept and will counter by bringing the US under an analogous threat.

Another favourite argument of the Western strategic community is that the Soviet Union, after achieving nuclear parity, has displayed an increasing lack of restraint in intervening in the developing world. And so we have the 'linkage thesis', which argues for the US re-establishing strategic superiority. In the process, the historical fact that even when the US had overwhelming nuclear superiority the Soviet Union as a major global power exercised its influence in various parts of the developing world, Congo, the Indo-Chinese peninsula, West Asia and Cuba, is forgotten. At one time Dr. Kissinger himself exclaimed, "What in God's name is this strategic superiority?" and argued that at the levels of stockpiles in the two super-powers' possession numbers no longer mattered; but others have pointed out that deterrence is a matter of perception, therefore numbers do count and are politically meaningful. This view makes nuclear arsenals the currency of power. To buttress this view the Non-proliferation Treaty was promoted, treating nuclear-weapon powers as a class apart, and exempt from safeguards. This thesis appears to have won acceptance, and the US has launched on a programme of adding thousands of nuclear warheads to its stockpile of 25,000-35,000.

The Soviet Union stands by the concept of equal security. It will not allow the US to regain strategic superiority and will strive to maintain the parity established in SALT I and SALT II. The Soviet Union, besides, has three other nuclear adversaries — Britain, France and China. The first two are modernising their nuclear forces, which will give them a capability to pose a significant and independent threat to the Soviet Union; hence their arsenal can no longer be left out of count. The Chinese have attained inter-continental missile capability and are steadily adding to their nuclear arsenal.

New generations of weaponry are coming in at the conventional level also. Even nuclear-weapon powers devote more than 80-85 per cent of their military budgets to conventional arms. New F-14, F-15, F-16 and F-18 aircraft are replacing the earlier-generation F-4s, A-4s, A6s in the West; the Tornado and Mirage-2000 are being introduced by Western Europe. On the Soviet side MiG-27s, 29s and new Sukhoi aircraft are replacing the MiG-21s and earlier Sukhois. The British Challenger, the German Leopard II, the US XM-I and the Soviet T-72 and T-80 are the new-generation tanks. New anti-tank, air-to-air and air defence missiles are also being introduced. Both the super-powers' naval build-up also is growing spectacularly. The Soviet Union is reported to be building nuclear-powered aircraft-carriers and the US Defence Secretary has declared the United States' intention to re-establish its naval supremacy. This equivalence of the super-powers, with matching nuclear and conventional capability and powerful global navies, is historically unprecedented. In other times, this would have led to a war to settle who was superior. But now, the super-powers are, in Robert Oppenheimer's words, like two scorpions in a bottle and, to quote Dr Kissinger, are doomed to coexist.

This central arms race has a universal impact, even among non-aligned nations that profess to keep out of the bipolar rivalry. It is only a matter of time before any sophisticated conventional weaponry introduced in the industrialised nations finds its way to developing countries. Some of them who have surplus resources from oil buy them; for the major arms producers this is a godsend for recycling petrodollars. Arms supplies are also made to developing countries because of significant strategic locations, supply of vital raw materials or the need to attract and retain political support. Neighbours of such countries are then compelled to acquire matching weaponry from the same or alternative sources. Not all these secondary arms races can be explained in relation to the central super-power rivalry, but by and large they are sustained by supplies of arms by five or six industrialised nations, mainly the super-powers. Thus the central arms race has in a sense an induction effect on all arms races.

Some reasons for the rise in the developing countries' arms expenditure are very legitimate and understandable. Dozens of new nations have been decolonised in the last two decades. Most of them had to raise and equip modest forces for their legitimate security needs. The developing countries in fact cannot be accused of excessive defence expenditure, leaving aside some of the oil-rich countries and a few other special cases. Between 1955 and 1980 the Latin American share of global defence expenditure went up from 1 per cent to 1.8 per cent. Africa's share went up from 0.1 per cent to 1.7 per cent, but then, nearly 40 new countries became free in this period. In South Asia it rose from 0.6 to 1.1 per cent. The main increases were in the Middle East from 0.6 to 7.8 per cent and in the Far East from 1 per cent to 3.6 per cent. In other words, totalling up we find that while the global share of developing countries in defence expenditure between 1955 and 1980 as a whole rose by 12.8 per cent, the figure for the Middle East and Far East was 9.8 per cent. And most of the increases here can be imputed to super-power rivalry and influence.

In the period 1945-1976, out of the 115 wars that took place in the developing world, the industrialised countries intervened in 70 — the developed market economy countries in 64 and the socialist countries in six. Third World countries intervened on 17 occasions. In this period, a Brookings study says, the US attempted to project a posture of force 215 times and the Soviet Union 195 times. For the Third World, the probability of interventions by the industrialised world in the developing world is a major cause of concern.

The above account sets out in brief detail the nature and structure of the arms race in the world of today and its dynamics. A number of new technological developments are adding extra dimensions to the race. More important among these are (i) neutron weapons, (ii) the development of new chemical war agents and their deployment, (iii) new technologies for isotopic separation of plutonium, (iv) laser weapons for ABM system, (v) killer satellites, and (vi) development in anti-submarine warfare capabilities.

The US Administration has taken a decision to manufacture and stockpile neutron weapons. The ostensible justification is that this weapon will be able to destroy armour effectively with minimum collateral damage. But is opponents fear that this very advantage may lead to lowering of the nuclear threshold and lead to readier resort to the weapon. Troops subjected to neutron radiation do not all die instantly. Many of them face agonising and certain death in the next few hours, and they will be raging men not subject to discipline. If some of them have nuclear weapons with them — not necessarily neutron weapons — they may quite possibly use them with or without authorisation. Consequently, the advantage of minimum collateral damage may not last very long.

Of late chemical warfare agents have attracted significant attention. The US Administration has allocated 100 million dollars for 1981 and 500 million dollars for the next five years for manufacture of these weapons. The new chemical warfare weapons will be binary gases. Two gases, both harmless, are packed in two separate compartments in a shell or a bomb; they get mixed while in flight, forming a deadly gas. The US already has 42,000 tons of poison gas in stock. US estimates of Soviet stockpiles range from a tonnage smaller than the US stock to one many times greater. Negotiations for finalising a treaty to prohibit the use of chemical warfare agents have been going on in Geneva for several years, but are yet to produce tangible results.

Recent reports indicate that laser separation of the plutonium isotope-240 from isotope-239 has been achieved. The possibility of using this technology to produce weapon-grade plutonium consisting mostly of Pu-239, from reactor-grade plutonium which is a mixture of two isotopes, was considered in the US, in order to manufacture additional warheads. Finally it was decided to put up a new facility to produce weapon-grade plutonium. This development of laser separation has grave implications for the proposed comprehensive test ban treaty. The treaty is being advocated in the hope and belief that it would prevent testing of weapons underground to check how much the fissile material has deteriorated over periods of time, how such deterioration affects its explosive yield and generate other data required to maintain the nuclear arsenal at optimum efficiency. If laser isotopic separation is widely adopted, then it would make possible refining of plutonium from time to time and keeping up weapon-grade purity all the time. The treaty will not come in the way of weapon deployment and efficient maintenance of nuclear arsenals by the advanced nuclear-weapon powers who have already collected enough data with hundreds of weapon explosions but only hamper new nations from having efficient nuclear arsenals.

Yet another disturbing factor is the likely development of a laser-based anti ballistic missile system. In 1972 the two super-powers agreed to limit the deployment of ABM systems to two each and subsequently this was reduced to one. The USSR has deployed a system around its capital, the US has chosen not to deploy any. The main consideration for this restraint was technological. With the state of technology at that time nuclear explosions were used to vaporise incoming nuclear warheads, but this produced radar black-outs allowing further warheads to come in undetected. The new laser-based technology under development will destroy the incoming warhead with a high-energy laser beam. Since this does not produce any ionisation there will be no radar black-outs. Were this system to be successful, the 1972 ABM Treaty which comes up for renewal this year may not be extended or may be extended for a short period only and then given up. The abandonment of extensive deployment of ABM systems ensured that the mutual assured destruction doctrine prevailed. If the new ABM were to come in it would reinforce the war fighting doctrinal protagonists and lower the nuclear threshold.

As regards surveillance systems, satellites which give real time warning of any missile lift-off in the adversary's territory are integral to them. The super-powers have an agreement that neither will interfere in the national technical means of verification of the other. Both, however, appear to have tested satellite-killing systems. This might mean that one of the very first steps in any hostilities between the super-powers will be destruction of the surveillance System. With the loss of such surveillance capability either super-power is likely to act on a worst-assumption basis and compulsively escalate to uncontrolled massive nuclear exchange.

Nuclear-missile submarines constitute an invulnerable second-strike capability. Their existence ensures that the adversary is not tempted to launch a disarming first strike of landbased systems. But to be invulnerable they have to be undetectable. The opacity of ocean waters and their vast expanse make this possible. Under-water sonar arrays have been installed on the ocean floor in the Atlantic and the Pacific by the United States to keep track of submarines passing over them. Anti-submarine warfare technology, continuously refining detection techniques, is under development. With any breakthrough making location of the adversary's submarines possible with a high degree of confidence, the doctrine of a disarming first strike will spread from land to the oceans. There is also the counter-effort to complicate surveillance by having large long-endurance submarines which, having crossed the listening barriers, may get lost in the vast expanses of the Southern Atlantic, the Southern Pacific and the Indian Ocean. This may explain the trend to build very large and deep diving submarines like the reported Typhoon class by the Soviet Union, with a displacement of over 24,000-27,000 tons.

All these disturbing technological developments do not necessarily mean that a stage has been reached completely eroding mutual deterrence and enabling one side to launch a disarming attack on the other. There is today increasing realisation that command, control and communication infrastructure is very vulnerable and may not be able to cope with the exigencies of nuclear war after the first few nuclear shots are fired. Secondly, for a massive disarming first strike thousands of nuclear warheads will have to be exploded quickly and over large expanses of the northern hemisphere. The impact of this on ecology will be mind-boggling, with the enormous radioactive fall-out, depletion of protective ozone layer, etc. For these reasons, a calculated outbreak of nuclear war between the super-powers belongs in the realm of madness. But an uncalculated outbreak is becoming increasingly possible, in view of difficulties in keeping centralised control over ever-increasing and widely dispersed nuclear arsenals. This in fact is the real problem of horizontal proliferation.

A dangerous trend has been in evidence since 1986 of increasing legitimisation of use and threat of use of nuclear weapons. The misnamed Non-proliferation Treaty in fact aims at legitimising the nuclear weapons in the arsenals of nuclear-weapon powers and compelling non-nuclear-weapon nations to acknowledge their legitimacy. It also vested the possession of nuclear weapons with prestige and exempted nuclear-weapon powers from all safeguards. Most industrialised nations profess to be non-nuclear, but they all rely on nuclear war doctrines for their security, permit nuclear weapons

Bench, Bar and Society

Failures and Opportunities

O. CHINNAPPA REDDY

CHANDIGARH is second home to me. When I went back to Hyderabad from Chandigarh, the *Tribune* was kind enough to refer to me as Punjab's unofficial ambassador to the South. I must hasten to say that whenever I refer to Punjab, I mean both Punjab and Haryana. Punjab showered its affection on me and my wife when we were here and we had grown to love the Punjabis for their rusticity, their simplicity, their candour, their vigour, their tenacity, their hospitality, and their warm friendship. Now, in Punjab as elsewhere, all sorts of fissiparous tendencies are showing up and are being exploited by various vested interests. Punjab is India's strength and Punjabis are, if I may say so, the true spirit of the unity of India. You will find them in all parts of the country, and wherever they are, you will find them going about their business as sons of that soil, with no sense of strangeness or aloofness and without ever drawing themselves into any shell of their own, as people from the South like me are apt to do. The warriors of Punjab have always defended India's frontiers and fought against foreign aggression, invasion and occupation. I am sure they will do equally to preserve India's unity and integrity.

On occasions like this, where lawyers are gathered, it is customary to exalt the so-called nobility of the legal profession and pay tributes to it for its alleged services to society, its independence and so on. I will refrain from doing so and I request you to pardon my impudence. In fact, if we but walk across the road, stop a few of the passers-by and ask them what they think of us lawyers, we may learn quite a few home truths. We will learn that they view us as expert craftsman, proficient in the mysteries of the mystic language of the law, generally available for sale to the highest bidder to do the bidding of other men. If the person is gifted with a sour tongue he may even describe us as parasites. If we protest our selflessness and dedication, he may silently laugh at us in derision. However much we may posture and preen and claim vast importance, we may not convince him of our disinterestedness and devotion. Let us not, therefore, be under any delusion and let us rid ourselves of all exaggerated sense of self-importance. The plain truth of the matter is that ours is an occupation which involves our espousing other people's causes but always for a nice, round, fat fee.

In the past, the legal profession, which naturally includes the judiciary, has generally kept aloof from the influences of the creative forces in society and from the interaction of new ideas. It has generally been a symbol of conservatism and a pillar of the old oder. *Status quo* has been the motto of the legal system, and the traditional role of the legal profession has been no more than the service of its clients, the maintenance of the social, political and economic order of the day, in the creation of which it played no part, and, in the words of an erstwhile president of the Canadian Bar Association, "the performance of the house-keeping function of the society without any responsibility for the form and content that it takes."

This contribution is the address delivered by Justice Chinnappa Reddy, Judge of the Supreme Court, while inaugurating the Chandigarh unit of the Indian Association of Lawyers on May 8, 1982.

In the process of making the legal profession an exclusive craft, lawyers have succeeded in mystifying the law and becoming its priests. And, often enough, the legal profession has been identified, not as the champion of justice, social, economic and political, but as the able mouthpiece and the loyal lieutenant of powerful economic, social and political, special interests. Like astrologers, palmists, magicians and other prophets of false sciences, lawyers and judges have developed a jargon of their own which forms a bond of union among them, setting them apart from the rest of society and reinforcing in them complacence and resistance to reform. The language of the law has become an instrument of exploitation, progressively so as the complexity of the law increases enormously. The fantastic prolixity and obscurity of the statutes, the complexity and the expense of the court procedure, the artificiality and irrationality of the modes of proof, all add to the mystery and the atmosphere of awe created around lawyers, judges and courts. Judges are made to appear as the high priests in temples of justice presided over by an awesome, blind deity.

All this must go. The winds of change are blowing, indeed they are blowing fast and furious. Elsewhere momentous and even convulsive changes are taking place. Social, economic and political systems are undergoing rapid and radical transformation. Unsolved old problems are taking new shape. Multiple new problems are cropping up. Old or new, the problems have acquired a sense of urgency, of expectency and of imminence. The time is appropriate to review the working and to evaluate the achievements and the failures of the legal system under which courts have been functioning. The time is ripe to think in terms of adapting, changing and revolutionising the about-to-wither system to meet the demands of the newly-awakened socio-economic and political consciousness of our people. We have to ask ourselves, how has the existing legal system served the people in the past? What are its defects? What are the needs of the people today?

Is the existing system designed to meet the new challenging demands and to advance the aspirations of the people? Is it not a fact that there are inherent limitations in the existing legal system which make it rigid and averse to basic social, economic and political changes?

Is it not a fact that these inherent limitations of the legal system to bring about changes have, not infrequently, afforded the politicians an alibi to cover their own failings? What are the changes that should be brought about to rebut the politicians' alibi and to make the legal system respond affirmatively to the demands for change and play a positive role in the establishment of a socialist, secular democracy? What does socialism mean in the context of the existing legal system? Does it mean equal distribution of wealth among the wealthy and denial to the needy? What does socialism mean to judges and lawyers? Does it merely imply religious freedom and not eradication of ignorance, myth and superstition? These are questions which require an immediate answer if the rule of law is to flourish and if the legal system, courts and lawyers are to be relevant to society.

The first step, therefore, is to build a legal philosophy upon secular and socialist ideals. To do that we must take stock of history and the processes of history, since there can be no social, economic or political philosophy which is not founded on a historical base. The future cannot be shaped without peeping into the past and looking at the present.

Let us therefore take a hurried glance at recent legal history. Half a century ago the country was under the rule of imperialist overlords and feudal lords. The imperialist overlords found themselves involved in a life and death struggle with the fascist forces of Germany, Japan and Italy. The imperialists claimed that they were fighting for the ideals of liberty, equality and justice. The forces of revolutionary change in India spearheaded by the emerging Indian bourgeoisie, inspired by the same ideals of liberty, equality and justice which the colonial lords claimed had inspired them in their fight for survival against fascism, put an end to colonial and feudal rule. The colonial rule of the British came to an end with the passing of the Indian Independence Act. The feudal authority of the princes similarly ended with the signing of the instruments of accession by them. The triumphant revolutionary bourgeoisie gave us the Constitution. The battles with colonial and feudal forces were still fresh in their memory when the Constitution was made and so certain freedoms and rights, such as freedom of speech and expression, freedom of assembly and association, freedom of movement, right to life and liberty, right to equality before the law, right to equal opportunity and so on, were recognised as basic and incorporated in the Constitution as fundamental Rights.

The Constitution-makers, essentially bourgeois in character, were careful enough to forge an armour for their own protection (i) by subjecting several of the freedoms to reasonable restrictions, (ii) by including the right to property among fundamental rights, (iii) by providing for preventive detention, and (iv) by relegating primary rights, such as the right to work, the right to an adequate means of livelihood, the right to a living wage, the right to equal pay, the right to share the material resources of the community, the right to easy access to justice and so on, to the category of Directive Principles which could not be enforced in a court of law. Courts and in particular the Supreme Court were specially entrusted with the task of protecting Fundamental Rights. It was apparently thought that the judiciary, belonging to the same class as the rulers and steeped in the British tradition and always ready to borrow from American experience, could always be relied upon to assert and expound all the maxims of interpretation perfected by the bourgeois ruling classes in Britain and America.

Soon after its emergence as the ruling force, the bourgeoisie put an end to the last vestiges of feudalism by the enactment of legislations abolishing zamindaris in the various States. To prevent any challenge to the legislations by the zamindars, Parliament was quick to pass the First and Seventeenth Amendments of the Constitution. The zamindars fought losing battles in courts. The validity of the First and Seventeenth Amendments was upheld by the Supreme Court in Sankari Prasad and Sajjan Singh. The Supreme Court sustained the power of parliament to amend the Constitution, including the right to abridge or take away any of the Fundamental Rights.

But the non-bourgeois revolutionary forces were not content with the abolition of the princely order and the zamindaris. They wanted more. They wanted drastic land reforms. The pressure of these forces resulted in some half-hearted legislative measures imposing ceilings on holdings of land. They were soon questioned in courts. A class-dominated court, unable to grow out of 19th century bourgeois liberal, legal ideology, responded with Golaknath, to deny to Parliament the very right which it had earlier conceded in Sankari Prasad and Sajjan Singh, that is, the right to amend the Constitution so as to abridge or annul any of the Fundamental Rights. But the forces of change continued their pressure and succeeded in getting Golaknath reversed in Keshavananda Bharati. But they lost even as they appeared to win. The Court built another citadel around the Constitution and said Parliament did not have the power to amend the Constitution so as to alter its basic structure. The Court reserved to itself the right to say what the basic structure was and thus to adjudicate about every future amendment of the Constitution. The forces of change as well as the forces of *status quo* are seeking to use the basic structure theory to contend that whatever amendment is disadvantageous to them alters the basic structure of the Constitution.

The ambivalent response of the Court in the past to the challenges by forces of change and forces of *status quo* is well illustrated by the two cases of Gopalan *vs* State of Madras and R.C. Cooper *vs* Union of India. In the first case, Gopalan, a Communist, detained without trial under the provisions of the Preventive Detention Act, claimed that the fundamental rights guaranteed by the various clauses of Article 19 had been denied to him as the law providing for preventive detention did not provide a fair procedure. He claimed that the provisions of Article 19 should be read with the provisions of Articles 21 and 22 of the Constitution. The Supreme Court held that Article 22 was uncontrolled by Article 19 and, in effect, denied procedural fairness and freedom to the detenu. The response of the Court was different when it was the right to property they had to deal with. In Cooper's case, it was held that a law providing for acquisition of property had to satisfy the requirements, not only of Article 31, but also of Article 19. The observations in Gopalan's case were announced to be incorrect. Via the right to property, the right to procedural fairness was secured to the citizen. The forces of change have now seized upon Cooper's case to demand fairness in every other matter.

In Shivkant Shukla's case, a terrible blow was dealt to all progressive forces by the Court shutting its very doors to everyone seeking a writ of habeas corpus during the internal Emergency. Article 21 was rendered practically lifeless. But the forces of change recovered from the shock. A good deal was not only repaired but a judicial road-sign was erected in Maneka Gandhi's case pointing the path to new legal pastures. It was laid down that any law encroaching upon the right to life and liberty guaranteed by Article 21 had to satisfy the requirements of Articles 14 and 19 and, therefore, could not be arbitrary, unfair or unreasonable.

Again, in Minerva Mills the Court pulled down the Directive Principles of State Policy from the position of primacy accorded to them in recent years, while in Waman Rao the Court appeared to swear by the same Directive Principles.

These inconsistencies are not accidental. They are not variables dependent on the idiosyncrasies of individual judges. They are, as I had occasion to mention elsewhere, conflicts between the class and conscience of judges. A judge belongs to a class. He possesses a conscience by which I mean, and this I want to make clear, not any inner voice but a consciousness of the process of history. When the interests of class dominate the judge's thinking, unconsciously though it be, we have Golaknath, Shivkant Shukla and Minerva Mills. When conscience sways over the judge's mind, we have Shankari Prasad, Maneka Gandhi and Waman Rao.

What I am at pains to point out is that the legal system is tainted by its class structure and character, inevitably so. If the legal profession desires to be relevant to the society of the future, it is necessary for it to rise above its class character, to participate in the evolution of a new socialist legal philosophy tuned to our Constitution and to actively involve itself in the struggle of the exploited and underprivileged people to press their claims for justice and equal access to national wealth, forgetting petty loyalties of blood and soil, that is, of community, religion, language and region. Already, there are favourable signs of ferment and change of judicial attitudes. Lawyers and judges are engaged in a search for new frontiers, new strategies and, necessarily, a new philosophy. Witness the great jurisprudence of Habeas Corpus, Natural Justice and Ultra Vires which has grown in the last four or five years. Witness the Court's pronouncements in Maneka Gandhi, Ranganatha Reddy, the Bihar Blindings, Randhir Singh, etc. Nowhere in the world will you find much jurisprudential movement.

But that is not enough. We have a long way to go. The way from ignorance to secularism and from poverty to socialism is long and thorny. Let us breathe life into the concepts of secularism and socialism so valiantly proclaimed in the Constitution. Let us forget all communal, regional, tribal loyalties and march forward, hand in hand, heart with heart, towards a better world with loyalty and commitment to the human race and human life. ☐

Sri Lanka's Code of Conduct

On March 31, 1982, Sri Lanka's Cabinet adopted a code of conduct for Ministers laying clear guidelines to ensure that no holder of ministerial office would be faced with the situations of conflict between duty and private interest. The Code of Conduct for Ministers was adopted along with the Code of Conduct for those holding public office. Both codes were prepared by the Law Commission and were submitted for consideration to the Cabinet at the request of President J.R. Jayewardene.

FOR MINISTERS

The Code of Conduct for Ministers states:

1. At meetings of the Cabinet and its committees, a Minister should disclose to his colleagues when he has an interest which does or might reasonably be thought to conflict with his public duty as a Minister. His declaration should be noted in the Cabinet records. The Minister should then either indicate that he will not take part in the discussion or else secure the explicit authorisation of his colleagues for taking part.

2. When directing the business of his Ministry or any department, a Minister, whether of Cabinet or non-Cabinet rank, should inform the President of any apparent or real conflict of interest that may arise. The President, unless he asks a Minister to divest himself of the interest, should either arrange for another Minister to deal with the matter or else give explicit authorisation to the original Minister to proceed with it.

3. Apart from the declaration of assets and liabilities made under section 3 of the Declaration

of Assets and Liabilities Law No. 1 of 1975 by Ministers and Deputy Ministers such Ministers should disclose to the President the following information:

(*a*) beneficial interest of the Minister or a member of his immediate family under any trust and in nominee company with a statement of the nature of operations of the trust or company;

(*b*) any trust of which the Minister is a trustee with the statement of beneficiaries and the nature of the operations of the trust;

(*c*) partnerships and joint venture interests with the statement of the nature of operations;

(*d*) shareholdings under procedure which will disclose the ultimate interests in circumstances where private companies are used as a screen to mask holdings directly or indirectly in other companies.

4. A Minister should divest his shares and similar interests in any company or business involved with his ministry or any department thereof.

5. A Minister should resign all directorships in public and private companies which engage in significant trading operations but may retain directorships in private companies which operate farms or agricultural holdings or investments but not otherwise.

6. A Minister should cease to engage in professional practice.

7. A Minister should cease to be involved in the daily routine work of any business.

FOR PUBLIC SERVANTS

The Code for Public Servants states:

1. An office holder should be frank and honest in official dealing with his colleagues.

2. An office holder should not subordinate his duties to his private interests: he should avoid situations in which his private interest, whether pecuniary or otherwise, conflicts or is likely to conflict or might reasonably be thought to conflict with his public duty.

3. When an office holder possesses directly or indirectly an interest which conflicts or is likely to conflict with his public duty, or improperly influence his conduct in the discharge of his responsibilities in respect of some matter with which he is concerned he should disclose that interest according to the prescribed procedures.

4. When the interests of members of his immediate family are involved the office holder should disclose those interests to the extent that they are known to him. Members of the immediate family will ordinarily comprise only the office holder's spouse and dependent children, but may include other members of his household or family when their interests are closely connected with his.

5. When an office holder possesses an interest which conflicts or is likely to conflict or might reasonably be thought to conflict with the duties of his office and such interest is not prescribed or required as a qualification for that office, he should forthwith divest himself of that interest or secure his removal from the duties in question or obtain authorisation of his superiors or colleagues to continue to discharge the duties; transfer to a trust or to a member of the office holders' family is not a sufficient divestment for the purpose. If immediate divestment would work significant hardship, possession of the interest should be dislosed to colleagues or superiors and authorisation obtained for temporary retention pending divestment.

6. An office holder should not use information obtained in the course of official duties to gain, directly or directly the pecuniary advantage or other benefit for himself or for any other person in particular. He should scrupulously avoid investment or other transactions about which he is or might reasnably be thought to have early or confidential information which might confer on him an unfair or improper advantage over other persons.

7. An office holder should avoid giving the impression that any person can improperly influence him or unduly enjoy his favour.

8. An office holder should not use or permit any other person to use facilities and services such as transport, stationery and secretarial or other services — provided by the State for use only in his official duties, for any purpose other than for and in the performance of those duties.

9. Public officers holding any of the posts or positions mentioned in the schedule to this rule should obtain official assent if they wish to take up employment within two years of resignation or retirement from public employment in the following business or other bodies:—

(*a*) those in or anticipating contractual relationship with the Government;

(*b*) those in which the government is a shareholder;

(*c*) those in receipt of government loans guarantees or other forms of capital assistance;

(*d*) those with which the officer's department is otherwise in a special relationship; and

(*e*) those associations whose primary purpose is to lobby Ministers, Members of Parliament and Government departments and authorities.

DISCUSSION

Scientific Temper

A Statement on Scientific Temper signed by outstanding intellectuals, released by P.N. Haksar at the Nehru Centre in Bombay (*Mainstream*, July 25, 1981), has touched off rethinking in a broad spectrum of our national life. Eleven comments on the Statement have so far been published in *Mainstream* (August 29, October 10, November 14 and December 19, 1981, January 2 and 16, February 6, and April 17, 1982). We publish here a contribution by T.G. Vaidyanathan, Professor of English, Bangalore University. —*Editor*

Tackling the Real Enemy

T.G. VAIDYANATHAN

READING "A Statement on Scientific Temper" (*Mainstream* July 25, 1981) with its imposing list of signatories was a painful ordeal in more senses than one. Thirty occurrences of the phrase "Scientific Temper" (out of a grand total of 32) without the benefit of the definite article have persuaded me that the written English of our leading spokesmen for science needs a great deal of improvement. I was almost tempted to write a companion piece to Nandy's entitled "The Case of the Missing Article" but desisted, urgently as this is required in the interests of the science of English grammar. I shall, instead, turn to the arguments advanced by our distinguished friends. They take the form of a series of broadsides against the traditional enemies of science ('superstitions' like astrology etc., and, by implication, religion) before outlining what the authors take to be the *sine qua non* of the 'scientific temper' (which I refuse to capitalise because this does not further either the cause of English or of science).

I shall begin with the case of Christianity since the signatories clearly regard it as having been the chief obstacle in the path of scientific progress in the 17th century. Consider their observation that "the obscurantism enforced by the Church led Italy to losing the benefit of the Renaissance." In the opinion of the signatories this is singularly deplorable since Galileo "the harbinger of modern science" was an Italian! Let us deplore instead the implicit chauvinism of this approach and, in passing, remind the venerable authors of their own favourite maxim: "Science is universal." Now what about their more substantial charge against the Roman Catholic Church? The same story goes from Condillac and Condorcet down to the 20th century heirs of the Enlightenment like Lecty, Dewey and Betrand Russell that, since Galileo was persecuted by the Spanish Inquisition, this is the norm for all religions everywhere in the world. But, we must remind ourselves that very often the Church authorities and institutions were on very good terms with the scientists. Copernicus dedicated his book *De Revolutionibus Orbium* to Pope Paul III! Galileo, himself, up to 1632 at least, was a good friend of the Pope and other leading Churchmen. Descartes, "that Robespierre of the scientific revolution" (as Koestler calls him), owed his career to Cardinal Berulle. Then to top it all, the Royal Society in England was started and led by a group of Anglican bishops. It almost looks as if science would not have got off the ground but for the fostering care of certain Churchmen and some religious institutions!

The truth is that a good deal of the burning, torture and incarceration that took place during the 16th and 17th centuries — which sorely troubles the modern conscience — was not due to the alleged battle between religion and science but due to internecine technological warfare. The great Servetus (1511-1533), whose scientific contribution was enormous, was burned — so the story goes — because of a misplaced theological adjective! Calvin had him killed because Servetus prayed to the son of the Eternal Father and *not* to the Eternal Son of the Father. Similarly heresy hunters of the Inquisition were more intent on catching secret Jews, secret Muslims and Lutherans than scientists *per se*. Most scientists probably died — like the rest of us — of old age or that notorious killer — medical malpractice. Unless, of course, like Bruno they combined their scientific work with religious interpretations. But theological heretics like Archbishop Carranza, the primate of Spain, had a very rough time indeed. They were forced to spend a lifetime in prison before being forced to recant (without being told what their crime was!), *then* being tortured to see if they really recanted, *then* being forced to name all the other heretics they knew, and *then* the Inquisition authorities would decide the proper punishment. On the other hand, scientific 'heretics' like Galileo had a comparatively cushy time. Against all precedent he was not even confined to the dungeons of the Inquisition. He didn't, contrary to legend, spend a single day of his life in a prison cell (Bercht follows legend rather than historical fact in confining Galileo in prison in his play). He was actually allowed, *during his trial*, to stay first at the Tuscan Ambassador's Villa Medici and then he was assigned at 5-room flat in the Holy Office itself with a view of the Vatican gardens. He was even allowed a personal valet and the Ambassador's major domo looked after his food and wine. His 'imprisonment' was a mere formality spent first at the Grand Duke's villa at Triniti del Monte and then at the palace of the Archbishop Piccolomini of Siena. Even the weekly recitation on the 7 penitential psalms was delegated, with ecclesiastical consent, to his sister, Sister Maria Celesta, a Carmelite nun. Some martyrdom indeed!

In such a world dominated by theological strife, the 16th or 17th century scientist generally steered clear of the Church. If anything he sought to harmonise the new findings with the teachings of religion. Copernicus, himself, was not only a Catholic but a priest and a canon as well who was so esteemed by the Church that he was even called to Rome to participate in a Lateran Council under Leo X for the reform of the Gregorian calendar. He knew that a better understanding of Nature could only help in appreciating God's achievement and His message. He also knew how to interpret scriptural statements that were apparently in conflict with the data as allegorical, symbolical, metaphorical and so on. Kepler, in his mystical Kabbalastic frenzy, could see his monumental vision of the mathematisation of Nature as bringing him closer to knowing God and his Message. Galileo, himself, was a good Catholic who saw no real conflict between religion and science. In his oft-quoted "Letter to the Grand Duchess Christiana" he cited with approval the maxim of Cardinal Baronius that "the intention of the Holy Ghost is to teach us how one goes to heaven, not how heaven goes." His champion was himself a staunch Catholic, Father Tomasso Campenella, who in his famous *The Defence of Galileo, Mathematician of Florence* showed how all the apparent counter-evidence in the Bible and in the Church Fathers could be handled by traditionally acceptable exegetical techniques. In fact the new mechanistic worldview was accepted and propagated enthusiastically by Father Mersenne, Father Gassendi and Descartes. In fact the Jansenists of Port Royal became the leading advocates of Cartesian physics in France. They went on to reconcile religion and science by a sceptical *tour-de-force*. Since certain and necessary knowledge of the real world is impossible they argued that we developed an empirical science which, while hypothetically describing the phenomenal world, provides us with a pragmatic guide to living. Science does not and cannot give us a true picture of reality but merely provides predictions which can be verified. Religious knowledge, gained by faith and revelation, is not open to scientific, questions and sceptical doubting. This position found its most celebrated expression in the Pensies of Pascal.

The Catholic indictment of Galileo for propagating Copernican hypothesis does indeed mark the beginning of the parting of ways between religion and science. But the rupture was not inevitable and it was much more due to Galileo's intransigence, bad faith and personal vanity than due to the Church's intolerance. Even his way of stating the facts was "in itself ... not more true than the formulation of the Inquisition" as Whitehead has pointed out in his *Science and the Modern World* (1925). All this, of course, finds no place in the rationalist's mythography of our times where he is presented "as the Maid of Orleans of Science, the St. George who slew the dragon of the Inquisition" (Koestler, *The Sleepwalkers* 1959, p 358). But as we have already noted the Inquisition treated him rather well and, in fact, let him off the hook very lightly. As Koestler remarks: "From a purely legal point of view the sentence was entirely a miscarrage of justice ... the judgement hushes up the incriminating contents of the book by stating that Galileo had represented the Copernican system as merely 'probable' — which is a whale of an understatement. It also hushes up the fact that Galileo had been lying and perjuring himself before his judges by pretending that he had written the book in refutation of Copernicus ..." (*ibid.* p 501). No, Galileo was not the stuff of which martyrs are made. In any case the claim of our distinguished signatories that "adherence to obscurantism enforced by the Church led Italy to losing the benefit of the Renaissance" ignores the very course of Italian history. As Joseph Ben-David has pointed out: "There is indeed no sign of cessation of scientific activity following the condemnation of Galileo. It is true that the activities of the Lincei were curtailed after the first attempt of the Curia to suppress Galileo. But some of the members and disciples of Galileo continued to be active throughout the first half of the century, and they participated in the foundation of the other famous Italian academy of the 17th century the Cimento (1657 — 1667)" (*The Scientist's Role in Society*, 1971, p 64). Actually the next generation saw the rise of Toricelli, Cavallieri and Borelli whose contribution to science was more substantial than those of any generation before or during Galileo's lifetime (it is to Toricelli, Galileo's disciple, that we owe the invention of the barometer). The shift of the centre of scientific activity to England and France and the gradual decline of Italian science — as indeed of Italian painting — was due to different historical causes.

The conflict of religion and science was more in the nature of a lovers' quarrel in the beginning. The real divorce came, not with Galileo. but with Hobbes in his *Leviathan* (1651). However it was spinoza who systematically applied scientific concepts to Judeo-Christianity in his *Tractatus — Theologico — Politicus* (1670), drafted as an answer to his expulsion. In his *Ethics* he set forth a completely rationalistic conception of the world in which everything could be understood in terms of a deterministic mechanistic science. In this conception, Judeo-Christianity was only one major example in the history of human stupidity which was to be understood as a kind of superstition due to fear (In this he was the forerunner of Freud, another Jew. who explained religion in similar terms). There was certitude in science and mathematics and historical religion was an impediment to a true and adequate understanding of the world.

Thus it was Spinoza and not any 16th or 17th century scientist who provided an ontological base for science's oncoming battles with religion.

It was in the 18th century that the rationalists of the Enlightenment opened the full-scale war of science against religion for, by then, the harmonisers of science and religion were in full retreat. In the 17th and 18th centuries the scientists annexed the physical and chemical worlds, in the 19th century the biological world and in the 20th century just about everything. Even religious gurus today ape the vocabulary of science for such is its prestige. So I suppose you can't really blame the scientists for feeling pretty ominscient. Thus our own signatories can claim that since "the method of science encompasses *all* aspects of communicable human knowledge", *therefore* "the fullest use of the method of science in everyday life and in *every aspect of human endeavour* from ethics to politics and economics is essential for ensuring human survival and progress" (emphasis mine). This seems a very tall claim to make indeed especially when taken in the light of the ultra-rigid characterisation of "the method of science". "The method of science" is seen altogether too romantically in exclusively anti-authoritarian terms. It is, we are informed, "incompatible with the acceptance of authorities of all kinds or of 'high priests' who may not be questioned". This ignores the fact that many great men of science have been great respectors of authority. Copernicus, one of the founders of modern science, relied entirely on Aristotle and Ptolemy. So far from criticising Ptolemy, he clung obstinately to him, observing that "if anyone on the contrary thinks that the ancients are untrustworthy in this regard, surely the gates of this art are closed to him". (*Three Copernican Treatises* 1959 p 57). No wonder even Kepler remarked later that "Copernicus tried to interpret Ptolemy rather than nature".

Again, to assert, that "there is, in fact, essential incompatibility of all dogmas with science" does not simply square with the facts. While Polanyi (1958) has stressed the way in which *esoteric beliefs and standards are tacitly* involved in all scientific judgements, the very title of one of Thomas Kuhn's most famous papers, "The Function of Dogma in Scientific Research" (reprinted in Barry Barnes (ed) *Sociology of Science* 1972), draws attention to this. The "pursuit of truth" (scientific or otherwise) is, in fact, impossible "without prejudgement" as the signatories fondly believe. So although there may be "several major differences between the scientific and the theological and metaphysical attitude" still to rule the latter out of court because of "the essential incompatibility of all dogmas with science" is to fly in the face of all the available evidence. Why Copernicus's own teaching was, as Butterfield has pointed out, "entangled ... with concepts of value, teleological explanations and forms of what we would call animism" (*The Origins of Modern Science* 1957), E.A. Burtt in his *The Metaphysical Foundations of Modern Physical Science* (1925) has shown that in the time of Copernicus there were no known facts which compelled the adoption of the system and several which militated against it. "Contemporary empiricists" he goes on to observe, "had they lived in the 16th century, would have been the first to scoff out of court the new philosophy of science". No wonder if Einstein himself has drawn attention to "a fateful fear of metaphysics" as the very "malady of contemporary empiricist philosophising" (Einstein, "Remarks on Bertrand Russell's Theory of knowledge" in *The Philosophy of Bertrand Russell* (ed) P.A. Schipp, 1944). That arch empiricist Russell himself virtually conceeds the point in his *History of Western Philosophy* (1948) and sagely, observes that it is not "*what* the man of science believes that distinguishes him, but *how* and *why* he believes it" (p 549: emphasis Russell's). This leaves, the door open to *all* beliefs — theological, metaphysical or whatever — and simply leaves us with the question of their validation. Popper's great merit is to have shifted the emphasis from the Humean problem of "reasonable belief" (that is, with *what* dogmas or myths — the scientist believes) to the problem of the 'reasons' for accepting or rejecting scientific theories (that is, with *how* and *why* the scientist holds it).

Another serious misconception that mars "A Statement on Scientific Temper" is the belief that "knowledge often progresses by disproving earlier ideas, beliefs, theories and laws". Despite the cautionary "often", the operative word here is "disproving" taking us, as it does, to the worlds of logic and mathematics. But in science there is simply no QED; all theories can be salvaged with *ad hoc* hypothesis and all experiments challenged, either as to their relevance or their accuracy. A classic example is the famous Michelson-Morley experiment which many people regard as a "crucial experiment' which 'disproved' the ether theory and paved the way for the theory of relativity (see Sir James Jeans, *Physics and Philosophy* 1942). But what are the 'facts'? Michelson first devised an experiment in order to test Fresnel's and Stokes's contradictory theories about the influence of the motion of the earth on the ether during his visit to Helmholtz's Berlin Institute in 1881. He concluded from the experiment that the hypothesis of a stationary ether was erroneous and hence that Fresnel was wrong. But soon the experimental physicist was taught a lesson by the theoretical physicist, Lorentz, who showed that Michelson had 'misinterpreted' the facts and that Fresnel's theory stood unrefuted. This situation led to Michelson and Morley's famous 1887 experiment the results of which were more cautiously worded. There was no more talk of having refuted Fresnel's theory. But still Lorentz was unconvinced. Meanwhile in 1897 Michelson carried out his long planned experiment to measure the velocity of ether wind on mountain tops. He found none! This was such an 'improbable result' that he decided that in 1887 he had drawn the wrong conclusion. It was Stokes's theory that had to be rejected and Fresnels's which had to be accepted. He was willing to accept any auxiliary hypothesis to have Fresnel's theory saved including Lorentz's 1892 theory. So much for what J.D. Bernel confidently describes as "the greatest negative experiment in the history of science". Actually *after* 1905, the Michelson — Morley experiment was not regarded as 'disproving' the existence of the ether and actually there is no mention of it in Einstein's 1905 paper. Which is probably why Michelson was awarded the Nobel Prize in 1907 not for 'refuting the ether theory' but for his "optical precision instruments and the spectroscopic and methodological investigations carried out with their aid". In fact, the 'famous' Michelson-Morley experiment was not even mentioned in the presentation speech and even Michelson himself did not allude to it in his Nobel Lecture. The history of modern science is replete with such examples. Chadwick's observation of beta-decay in 1914 seemed to imperil the conservation laws. But Pauli first playfully suggested a new particle, the neutrino (later developed by Fermi) and the conservation laws were 'saved'. As N.R. Hanson has pointed out, in science "conceptual matters are not finally settled immediately 'the' new observation or idea is suggested". (*Patterns of Discovery*, 1958).

Again the signatories are much too confident in distinguishing between 'myths' and 'superstitions' on the one hand and 'scientific' beliefs on the other without bothering to ask themselves whether the former may not often have been the source of the latter. Many of our scientific theories originated in 'myths'. The Copernican system, for example, was inspired by a Neo-Platonic worship of the light of the Sun who had to occupy the centre because of his 'nobility'. For the Pythagorean Kepler the Sun must be in the centre of the world because he is the symbol of God the Father, the source of light and heat. Thus Sir Karl Popper observes "...... science must begin with myths, and with the criticism of myths, neither with the collection of observations, nor with the invention of experiments, but with the critical discussion of myths and of magical techniques and practices because ...... *the critical attitude is not so much opposed to the dogmatic attitude as superimposed upon it:* criticism must be directed against existing and influential beliefs in need of critical revision — in other words, dogmatic beliefs" (emphasis mine).

Astrology is a classic case. Our signatories point out that in an age when "man has travelled to the moon *and returned safely* (a characteristic Indian touch, this, betraying, as usual, our national timidity despite all the brave talk!) astrological predictions based on the movements of the planets or the lines of one's palm or the number of alphabets in one's name is widely believed". This fails to distinguish the first case — which can be defended on sound scientific grounds — from the second and the third whose scientific status is certainly more dubious. In fact, man may not have gone to the moon at all had not certain astronomers — many of whom believed in astrology — speculated fearlessly. Newton's theory of gravity, especially the lunar theory of tides, was, historically speaking, an offspring of astrological lore as Popper himself concedes. Kepler's particular brand of astrology — he defended sidereal astrology and only opposed tropical astrology — is part and parcel of his unique Pythagorean vision of the Harmony of the Spheres. He wrote a number of treatises on astrology and in one of them, *De Fundamentis Astrologiae Certioribus*, he put forward 75 propositions, of varying intensity, whose soundness he was prepared to defend. Such another carried as a motto "a warning to certain Theologians, Physicians and Philosophers ... that while justly rejecting the stargazers' superstitions, they should not throw the baby out with the bathwater" (cited in *The Sleepwalkers*). Our very own 20th century mathematician of genius, Srinivasa Ramanujan, showed a serious interest in astrology, numerology, occult phenomena and prescience as Ashis Nandy has shown in his excellent monograph (*Alternative Science*, 1980). Recent studies at the Stanford Biometeorological Research Centre in Leiden and at the Stanford Research Centre in Menlo Park, California have revealed correlations between organic and inorganic processes and lunar, solar and planetary parameters. Yet as Paul Feyerabend has pointed out 186 scientists (including 18 Nobel, Laureates) signed a 'Statement against Astrology in 1975. And yet when a representative of the BBC wanted to interview some of the Nobel Prize winners they declined with the remark that they had not studied the subject! So let us not throw the baby out with the bathwater ...

What I am pleading for is a persistently, critical attitude towards all knowledge — scientific, religious, astrological, mythical or whatever — within the broad framework of a "rationalist imagination" guided by an "empiricist conscience." That is why I find Ashis Nandy's rejoinder "A Counter-Statement on Humanistic Temper" (*Mainstream*, October 10, 1981) calling for a virtual moratorium on science in India unhelpful and even, in places, positively dangerous. His plea for "equal rights to interpretation" looks like a plea for epistemological tolerance but when he goes on to celebrate the common man — "he has his own philosophy of science," we are informed — one begins to feel that the epistemological tolerance has degenerated into downright populism. The Feyerabendian philosophy of 'anything goes' (advocated in *Science in a Free Society* — clearly the source of Nandy's inspiration) comes from an affluent society. Hence it must be taken with more than the proverbial pinch of salt when it is sought to be applied to Third World countries where 'anything goes' in an altogether different sense of the term. Western societies are trying to liberalise options from a disciplined hard-core of order and implicit norms. We on the other hand, suffer from normlessness bordering on anomie and our immediate task is the building up of a civil society based on consensual norms. In this context 'anything goes' is a luxury we can ill afford in the present juncture. Criticism of science, if it is to be meaningful, should be attempted from within the system of science as conceptualised in the foregoing paragraphs and not, as Nandy recommends, "outside all systems" — defying "*all* concepts of rationality, normality, order and maturity" (emphasis mine). This is a counsel of despair which borders on outright irrationality and fully deserves Rajendra Prasad's censure that this is "the worst kind of opportunism (*Mainstream* April 17, *1982*). But Prasad himself proceeds to exhibit another brand of opportunism in a subsequent paragraph when he almost wilfully misreads the import of his own Santillana quote. Santillana is contrasting the "openness" of the Church *not* with Galileo but with the Committee investigating anti-American activities! Reagan may be a blundering fool but that does not make Reaganites of those of us here who have not absolutely made up their minds on the subject of incantations.

Prasad is right, however, incastigating the signatories for claiming that the national movement was "the outcome of a critique of traditional society." The national bourgeoisie made several "compromises" to mobilise popular support and this has certainly affected the drift of policy since Independence. But why is Prasad strangely silent on the origins of the Indian Renaissance which carried the seeds of the later contradiction? As Barun De, Sumit Sarkar and others have shown, many of the leaders of the Indian Renaissance never forswore Hindusism but only sought to reform it with the ideas of Western scientific rationalism. Sumit Sarkar has shown that "Rammohun in his published writings and public life paraded his outward conformity to most caste rules (even to the extent of taking a Brahmin cook with him to England!), wore the sacred thread to the end of his days, limited his direct attack on caste to a single *Vajra-suchi* translation and, concentrating all his social reform energies on the single *sati* issue, possibly even added to a slight extent to Vidyasagar's difficulties by hunting up all the texts glorifying ascetic widowhood" (Rammohum Roy and the Break with the Past" in *Rammohun Roy and the Process of Modernisation in India* (ed) V.C. Joshi 1975). In the light of this it can hardly be urged that "the best minds in pre-Independence times insistently propagated the need for the people to think independently and fearlessly and to question traditional beliefs." The Renaissance, then, far from witnessing the birth pangs of "the spirit of enquiry" witnessed instead "the growth of dependent vested interests, the elaboration of hegemonic infrastructure producing voluntary consent" which the "scientific temper" of the signatories is quite powerless to undo even today.

But Prasad himself presents science far too mechanistically as an expression of social forces to be capable of serving as their dynamic ally in revolutionising society. He himself gets unwittingly impaled on one of the horns of the very same dilemma bedevilling the signatories: the inculcation of the scientific temper will make people rational *but* (not "consequently" as the signatories argue for this will lead to the logical absurdity of a proposition entailing its own contradiction) the scientific temper cannot flourish in a non-egalitarian society. But Prasad's own brand of Marxism forbids any idealistic conception of science which is causally prior to the prevalent social forces. But Althuser himself has declared that science is outside the base-superstructure complex and hence exempt from Marx's dictum of the determination of the superstructure by the base in the last instance. (see *Reading Capital*, p 133). In view of this we cannot assume, as Prasad does, that "the scientific temperament is a component of the ideology of the class which will revolutionise society" because Marxism is not simply proletarian science but is something imported from "outside the proletariat and. ... "imported" into the working class movement" (*Reading Capital*, p 141). Further, Prasad's conception of science is far too positivistic and rationalistic, too undialectical in its antithesis of truth and error (electrons vs witches, astrology vs astronomy, incantations vs vaccines and antiseptics) to be fundamentally different from that of the signatories. I have already dealt with the question of astrology and as for incantations I will confine myself to just one observation. Claude Levi-Strauss has drawn attention to the similarities between the *shaman* and the modern psychoanalyst. The former's "incantation" is merely the reverse side of the latter's role as "listener." In both cases cure is effected through the phenomenon of transference" (*Structural Anthropology* Vol 1, 1963) (By the way I don't find any mention, let alone defence, of incantations in Nandy's "Counter-Statement" and I take it that Prasad has probably Nandy's *Seminar* (May, 1981) essay in mind).

Prasad's entire conception of science rests on the opposition between electrons and witches which poor Nandy is said to be unable to distinguish. Let me state categorically that electrons are witches in that both are postulated entities and serve in their own respective worlds merely as explanatory devices Paraphrasing the Harvard philosopher. W.V. Quine, we might say that in point of epistemological footing electrons and witches differ only in degree not in kind: certainly both are theoretical entities inferrable only from their effects. The myth of electrons is epistemologically superior in that it has proved predictively more efficacious than the myth of witches but both are cultural posts of different worlds and cultures and are "incommensurable" in the Kuhnian sense. This is *not* irrationalism but a statement of "scientific" rationality which is altogether different from both the bloodless and arid rationality of Prasad and the signatories on the one hand and Nandy's irrationalism on the other.

What is to be done and where do we go from here? Where but, yet again, a little wearily perhaps, to the West for enlightenment about the "scientific" temper, to *that West*, that is, which has *humanised* its social sciences with the teachings of that other Galilean. For, as Needham has reminded us, it is only the holiness of 'mercy, pity, peace and love' which will be able to save science from the dark side of its own terrible self.

If our new Galileans act promptly, then their theoretical ineptness can be overlooked. However, if they don't address themselves to such issues then we must conclude, with Prasad, that this class is in secret collusion with those reactionary socio-political forces which want to manufacture the Western cake in India on a large scale and sell it to the ignorant masses under the brand name of "Scientific Temper".☐

Genesis of Punjab Problem

The Language Question

P.K. NIJHAWAN

A curse of sorts has been operating in Punjab. Or else, how could two blood brothers quarrel over matters which are, to all intents and purposes, non-issues to those outside Punjab? And yet these seeming non-issues are today assuming more real proportions than most so called real issues, threatening the very foundations of an otherwise prosperous, virile, intelligent, hard-working and outgoing society and along with that perhaps all that we have held dear in Punjab as well as the whole of India. What is the genesis of this problem?

It is a situation created by colossal ignorance of reality, vile historical distortions, deliberate untruths, and gratuitous provocations. And today, the forces of reaction ranged on either side are not prepared to listen to reason, holding to ransom all that is beautiful, all that is worth loving, all that is sane and sincere. Love and hate both have their own arguments. And so much time has been allowed to lapse that pure fallacies have become larger-than-life facts or at least appear to be so. Let us try to unravel layer by layer this Himalayan mischief. Maybe then we can arm with sanity substantial numbers on both sides who instinctively feel that something wrong has been happening but do not know how to counter it.

For understanding the real nature of this knotty problem, one must at least have an idea of its five aspects, namely: first, the language aspect, which means the position of Hindi vis-a-vis Punjabi; second, the intellectual vacuum among the Hindu intelligentsia, which means a lack of the right kind of cultural and intellectual leadership; third, the religious aspect, which means the commonness and separateness of the Hindu and the Sikh religions, with special reference to the developments since partition; fourth, the compulsions of Sikh politics, developed because of the internationalisation of the problem of Sikh ambitions and frustrations born out of it; and fifth, the political power structure from the base to the top and the creation of vested interests in the operation of communalism in elective bodies all along the line.

Let us first discuss the language aspect of the problem. While the rest of India soon recognised the genius of their languages, the Punjabi Hindus remained passionately wedded to Hindi. Among the totality of Hindudom, the Punjabi Hindu was alone the one who spoke a deliberate untruth to disown his own language. He may have some imaginary or real reasons of his own for doing so, which history may not accept, for it is a colossal untruth. All that he can produce is some alibis. For example: Could a Bengali Hindu have disowned his language and stayed on in Bengal? Never. Then let us see what specially happened in Punjab.

The Punjabi Hindu, like most of the North Indian Hindus, had a worshipful attitude towards Hindi. Perhaps the people of the traditional Madhya Desh (the Jamuna-Ganga basin), as the late National Professor Dr Suniti Kumar Chatterjee has called it, who always give the lingua franca to India, and particularly the Hindus of that area, had taken Hindi to be the daughter of Sanskrit, which they had to approach with reverence and study through the indirect method of first going to its grammar. At least, the same happened in Punjab. Armed with Hindi just as Sanskrit in the days of old, both of which he did not know much, he started considering himself to be a superior cultural being. The Sikhs did not subscribe to this position of Hindi.

Still, during the days of the Independence movement, the Sikhs stayed with the Hindus as an offshoot of the Hindus. In fact, not a few called themselves superior Hindus. But after partition, there was a new type of communalism which had to be fed and kept alive. This communalism divided the Hindus and the Sikhs in the name of Hindi and Punjabi. Those who have witnessed the 'Hindi Satyagraha' movement in Hoshiarpur in the fifties would testify how this communalism snowballed. What a colossal misdirection of passion by the Hindus! Culturally thoroughly rootless and fed on Muslim phobia, the Hindu who was educated in Urdu and Persian as vernacular and Oriental languages which had now been substituted by Hindi and Sanskrit, refused to see reason. He could not for a moment believe that Panjabi could be so rich and grand a language as to be his mother-tongue and that it was in a way sister to Sanskrit. He had all time spoken Panjabi. But when it came to writing, he felt far more at home in English or Urdu. Not only that, to read and write Punjabi was *infra dig* for his superior cultural sensibility! Hindu women of the '30s and '40s had learnt Hindi as their only cultural language. Therefore, when the Sikhs said their language was Panjabi, the Hindus sometimes accused them of motives beneath one's dignity to accept. Not only had the Sikh to defend is language but with that his honour as a patriot as well, though it was the Sikh vote in the Constitutent Assembly which had made Hindi the 'Rashtra Bhasha' of India.

From this passionate but uncalled-for controversy was born the Punjabi Regional Committee and the Hindi Regional Committee. Why? The Punjabi Hindu had decided to record in the Census his language as Hindi and the Sikh the other way. I remember that in Simla in 1951 a Hindu enumerator recorded my language as Hindi even without asking me. And when I protested, he looked at me as If I were out of my mind.

Why am I so far accusing only the Hindus? I am quite conscious of the role being played by a handful of Sikh extremists. But that must be discussed at its proper place. Here it must be said that the real onus for what has been happening in Punjab must squarely lie on the Hindus for two very good reasons. Hindus are not only in brute majority in India, but were also in a majority in East Punjab after Independence and in all fairness it is the duty of the Hindus to let the minorities feel that their interests are safe with them and they need not worry about it. However, I wonder if at all the Sikhs are a minority. Secondly, in this case particularly the Hindus saw to it that the Sikhs were driven to desperation. It was a situation of reaction begetting reaction.

There was no justification for making Punjab an exception when the whole of India was going to be reorganised on the basis of "one language, one State" as a result of the recommendations of the States Reorganisation Commission. One can say that Gujarat-Maharashtra was another case where an exception was made. But then, soon the Government of India realised the futility of keeping Gujarat and Maharashtra together. Even so, nobody saw the writing on the wall. Punjab was left as it was just because of the intransigence of the Hindus.

The working of the Hindu mind in Punjab was not in tune with reality. No one could counsel sanity to them. Let me give a few instances.

When the then RSS Chief, the late Golwalkar, came to Chandigarh in the early sixties, he was quite explicit in stating that not Hindi but Panjabi was the mother-tongue of Punjabi Hindus. But as soon as he reached Jullundur, he was made to eat the humble pie. Then, there is the classic example in the late Goswami Ganesh Dutta, leader of Sanatanist opinion among the Hindus in Punjab. Even

The author is a noted journalist and author. This contribution is reproduced (in two parts) with due acknowledgement from Man & Development quarterly, Vol. IV, No. 1, 1982.

though a strong protagonist of Hindi and one-time President of the Hindi Sahitya Sammelan, he paid dearly for saying that Panjabi was the mother-tongue of the Punjabi Hindu. Before such stalwarts what could small fry like me do? In fact, most of my friends thought that I had gone berserk when I said that Panjabi was our mother-tongue and any pleading for Hindi was like speaking a deliberate lie for falsifying reality. And I know to my cost that it was the easiest way to become a butt for ridicule. In the circle of my friends, I had to rename myself Parshotam 'Singh'.

Professor Om Parkash Kohol of the G.M.N. College, Ambala, was, however, the only honourable exception. He counselled reason time and again through his articles in *The Tribune*. But unfortunately his was only a voice in the wilderness. No one was prepared to listen to his counsel of reason and even the Cassandra prophecies. Besides, he died very young.

Men of goodwill on both sides did try to reason it out, but to no avail. In the Senate of the Punjab University, Bhai Jodh Singh was ready to give a very vital concession to the Hindus. He said that if the Hindus were prepared to accept two scripts Panjabi could also be written in Devnagari. But the Hindu majority contemptuously rejected it. Then Bhai Jodh Singh was reported to have said: "You will rue this day". Isn't it happening?

Now let me argue from another angle. I have a firm conviction that if, hypothetically speaking, the Hindus alone had inhabited Punjab, or in other words there were no Sikhs in Punjab, then the Hindus would themselves have been second to none in demanding that a State based on Panjabi as its language be created. Why then this change of perception? The Urdu dailies of Jullundur must share the blame for this. For them it was as much a hangover of what had been done in Lahore before partition as it was plain commerce. They continued to write in the same vein, feeding people on half-truths. Curiously enough, the English press decided to play neutral, considering it a virtue not to speak the truth.

How big was the Hindu lie will be known if we look at the historical position. The Punjabi Hindu never knew Hindi up to the Independence of the country. Their women read it for two reasons: (a) to be able to read and write letters, and (b) to be able to read the religiou books of the Hindus because cheap and mass-published editions were becoming available. In point of time, the study of Hindi by the girls in Punjab hardly goes beyond the early decades of this century.

What was the position before? Most of the commonly-read religious books of the Hindus were available in the Gurmukhi script itself. In our own home, my great-grandmother, who daily read from a nicely calligraphed Kashmiri edition of Guru Granth Sahib to all the Hindu ladies of my town, had in her possession such religious works as *Yoga Vashistha, Bhagvat Purana, Bhartri Hari, Paras Bhag, Bhakta Mal, Bhagwad Gita* and a score of other books printed in Gurmukhi script only. All these books were printed by various Indian and German printers in the latter half of the 19th century. In fact, it was by reading these books in Gurmukhi script alone that the Hindu ladies had kept the torch of their religion burning in the far-off and inhospitable NWFP and Sind.

This testimony should in fact set at rest the controversy about the cultural nature of Devnagari script which is repeatedly made much of by protagonists of Hindi in Punjab. That is because when the Hindus finally were reconciled to the inescapable fact that Panjabi was to be their mother-tongue, they trotted out the lame excuse that Gurmukhi was not a proper script for Panjabi.

This, then, is the major cause of the conflict between the Hindu and the Sikh, though as already said there are four more facets to it. The situation has been worsening from stage to stage until the present time when a critical flash-point has been reached and no Punjabi, whether a Hindu or a Sikh, can afford to rest in peace until the storm blows over.

AFTER the loss of Lahore to Pakistan, there was a serious vacuum in the cultural life of Punjab (India). How did it come about? All that was best in Punjabi life was best expressed in Lahore only. The cultural movement was also most active in Lahore. After Calcutta, it was the biggest educational centre in North India. Most of the educational institutions, Hindu or Muslim, were created by the voluntary efforts of the people themselves — the same spirit of enterprise which distinguishes the Punjabi character even today. The Hindus, though divided into two sects, were evidently the most vigorous cultural group, for they were vying with each other in a spirit of healthy rivalry. The Sikhs, though emerging as a strong separate entity, were yet quite a part of the larger Hindudom in matters educational and cultural.

Let us now attempt a profile of the creative and literary life of Lahore. Urdu was by far the most dominant medium of self-expression. How dominant? I learnt my 3 R's at home in Hindi before I started on my formal education directly in the fifth standard of a staunch revivalist Hindu high school. My father had mentioned Hindi as my medium of instruction in the admission form. The headmaster, who was a friend of my father and one of the senior Hindu educationists of the day, asked me if I knew Urdu. When I said no, he himself changed the entry 'Hindi' into 'Urdu' on the admission form. When he saw me perplexed, he said: "When you grow up, you'll thank me for what I have done for you today". In short, in the middle-class Hindu milieu, it was difficult to think of a career without Urdu. Hindi was merely given lip-service for, though in our younger days Hindi was known as a language, a generation or two earlier nobody knew it as such. They called it 'Shastri', a local coinage to mean it was the language of only the priestly classes. This label was still very much there in my days. I remember when, in my childhood, I and my two brothers studied Hindi and Sanskrit, people around thought father was crazy to make us do so. They lamented that he was equipping his sons with education that could make them no better than priests, somehow the lowest in social esteem.

So, while English was studied for a career and success, it was Urdu which was the hall-mark of culture. It was the language of Allama Iqbal. Judges, officers of the Indian Civil Service, senior professors and intellectuals not only tried their hand at Urdu prose or verse as the case might be, but also had deep respect for anyone who excelled them in Urdu writing. How strong this tradition was can be known from the fact that when the late Pandit Harichand 'Akhtar' visited Karachi to participate in an Indo-Pak mushaira, Mir Ghulam Mohammed, the then Governor-General of Pakistan, not only invited him to tea, but himself came out to receive him, breaking all protocol. Similarly, when in 1950 I joined the Public Relations Department of Punjab (India) as article writer, an older and lovable Kashmiri pandit, who was my senior colleague, told me: "Don't be flattered or astonished if I tell you that even Faiz Ahmed 'Faiz' had once adorned this chair".

Next in order of importance were the Panjabi writers and poets. This was expressed at two levels: one was the common lay level and the other represented the Sikh renaissance. At the common literary level, all the three groups, namely the Hindu, the Muslim and the Sikh, wrote, mainly ballads and folk type of lyrical poetry. The renaissance Sikh movement was already definite though small. Bhai Vir Singh, Puran Singh, Gurbaksh Singh 'Preet Lari', Nanak Singh, Bhai Jodh Singh, Master Tara Singh and Principal Teja Singh had already made a name for themselves. Mohan Singh Mahir, Sant Singh Sekhon, Kartar Singh Duggal, Balwant Gargi were in the second line. Amrita Pritam, Kulwant Singh Virk were among emerging names. I have mentioned these writers because soon after partition, they were to become the intellectual leaders of Punjab's expression.

The last group in the field was the Hindi writers. It was a mostly group in the sense that the important ones in it were non-Punjabis. For most of the Punjabis Hindi was yet no more than a platform where, far from expression, it was identification that was more important. The non-Punjabi Hindi writers who had come to Lahore in search of greener pastures joined hands with one another. These groups were interested in editing course books for Hindi examinations of the Punjab University for these were sold in large numbers. Among the writers of these text-books, there was hardly any important Punjabi. The handful of Punjabis who were there wrote one-act plays, short stories, etc, not many of them with a touch of life and experience. Upendra Nath Ashk was among the exceptions and he, too, had strayed into Hindi from Urdu. Dinesh, Madhu and Rakesh had not yet fully emerged. The field was firmly held by Bhatts and Premis and some semi-literate Hindi teachers from outside Punjab who thrived on 'madeeasies' for the Hindi Ratna, Bhushan and Prabhakar examinations.

The picture, howsoever crudely drawn, will give us an insight into what happened after partition.

Once Lahore, the nerve-centre of Punjabi culture, went to Pakistan. language became truly the basis of communal polarisation between the Sikhs and the Hindus. Strangely enough, Urdu was still the most dominant cultural vehicle. The Urdu press of Lahore re-established itself in Jullundur. The old issues of Muslim League versus Congress or Pakistan versus India were replaced by the one of Sikhs versus Hindus. Not only that, whatever idealism was associated with the Independence movement now gave place to hard-headed commercialism. What I am trying to drive at is that in the new scheme of things, the Urdu press dished out venom in the name of Panjabi or Hindi for reasons other than serving a public cause. Curiously, the only Hindi daily to come out from Jullundur for long years was read, not because of its newspaper-value, but because it was the only vehicle carrying the pseudo-scholarly examination-oriented writings of the proliferating Hindi teachers.

Here comes the question of lack of intellectual leadership among Punjabi Hindus. There was no dearth of politicians, lawyers, preachers, academics, financial wizards and even philanthropists. But a man who could perceive the growing cultural vacuum among the Punjabi Hindus and provide the right kind of leadership was not there. There are some historical reasons for this. Always interested in the more mundane pursuits of life, the Punjabi Hindu had long been alienated from his cultural roots. The career-oriented Hindu had already taken to English in a big way. By serving the master well, which has been his forte all along, he had made it big. He had taken up the modern professions of medicine, engineering, pure and applied sciences, administration, etc, much before others. And though he was intellectually equipped, it was infra dig for him to even think of the uncouth Panjabi that the sub-stratum of 'vulgar' masses used, much less to own it as his mother-tongue. A few of them also wrote in English and did well, but it was individual effort. Isolated from the mainstream, the only cultural expression for most of them was an acquired supercilious English mannerism and high affectation in speech. In short, they were incapable of providing cultural leadership.

After partition, the Hindus who were mainly townspeople and had excelled in trade, commerce and banking, started imitating the elite. Success-oriented as the Hindu has all through been, he started learning English on an unprecedented scale, opting for the modern professions. This brought in its wake a cultural change of momentous proportions. In one family, while the elders still read Urdu newspapers, the younger generation was fed mainly on European literature. For a time Hindi and Urdu examinations also came handy to them. With their help one could appear directly for Matric (pass) and BA (only English) examinations and then go on to take even a post-graduate degree. This class was well-versed in Hindi or Urdu. But then learning was not an end in itself but a means to an end, which was to be able to support the family somehow.

This 'Earn and Learn' situation had a deleterious effect on the Hindu society of Punjab as it almost completely dried up its cultural springs. In this rat race of life, there was no time to pause, think and express oneself in any worth while manner. If anyone did express himself, it was more in the nature of ego projection than to belong to any definite cultural movement. Urdu, the language over which they had some mastery, made them only second-rate poets and writers. In Hindi, most of them did not possess the necessary tools and training to be writers. Hindi did not have the *Ustad-Shagird* institution. So, even if they did start well, they could not go far. Then, as before, the leadership of Hindi writing remained in the hands of non-Punjabis or text-book writers, placing creative writers in a secondary position which made them suffer from a severe inferiority complex.

Let me give an example from my own experience. In the fifties, and early sixties, I did write some Hindi poetry. Once I was presiding over a small 'Hindi evening'. A non-Punjabi University teacher of Hindi, who had no poetic sensibility whatsoever but lots of pretensions as he excelled in the clever use of Sanskrit words, recited a poem. The construction of the word which was the title of the poem was itself grammatically so wrong that I had to point out that glaring mistake to him, throwing discretion to the winds. The result? I immediately became *persona non grata* with the University group of Hindi writers!

Lest I am misunderstood by this example, let me make the point in a different way. I began with a statement that as the situation emerged after partition, the Punjabi Hindu became increasingly muted. Perhaps it was due to the curse of their own mother-tongue, the *Vac Devi* as we call it and which in this case means the Panjabi language, they had disowned.

In the last 35 years or so, while Punjabi has become a whole modern literature, with scores of writers in every genre, publishers, magazines, a bustling readership and a sense of commitment and direction, what has Hindi created? A barren intellectual scene! In fact, every attempt at comparing the cultural contribution made by Panjabi and Hindi languages respectively, brings out a very instructive contrast.

Now there are two questions arising from this situation. First, is the Punjabi Hindu culturally less virile than the Punjabi Sikh? Second, is the medium which is Hindi not responsive to his cultural needs? The first does not appear to be the case, for urban Hindus and Sikhs are the same stock and until yesterday, there was no difference in their cultural virility. The second question may therefore, by deduction, be answered in the affirmative. The new generation of Punjabi Hindus has grown under two influences — English and Hindi. Both of them basically underline the point that he is getting more and more alienated from the roots. He cries out his heart, whether in love and hatred, in Panjabi only. But when he comes to express himself, he does so in English or Hindi. Thus his expression becomes elitist and loses the touch of that lusty and limpid earthiness which courses through his veins. Yes, there are exceptions like Chandra Dhar Sharma Guleri, Mulk Raj Anand or Mohan Rakesh. But are they not too few? This goes only to prove that they do not make the rule. The rest are too much overawed by the cultural imperialism of Hindi. Hindus as a class have known Jayasi, Mira, Surdas and Bihari better than Nanak, Farid, Waris and Bullah Shah. In modern times, this chasm has widened almost to unbridgeable proportions. Even 40 years ago, the Hindu sensibility seemed to reject the Panjabi masters. For example, one day in 1946, I was roundly taken to task by my maternal grandfather for singing aloud some poignant "Heer" verses in our house. What he meant was that such pieces are worth singing only in *Deras, Dairas* or *Takias*.

Why is there this high-brow attitude to culture? Historically speaking, the highly puritanical religious movements of the nineteenth century had much to do with it. The Muslims felt that their fall from the throne of Delhi was due to the laxity of morals and discipline that surrounded them. Iqbal, the poet of Islamic regeneration, has shed tears of blood on this point. The Hindus felt that when they were the upholders of *Dharma*, they ruled the entire world. The Sikhs too had their own tale of lamentation. The empire of Ranjit Singh had vanished just because the Sikhs were no longer following the path shown by the Guru. So, all the three revivalist movements placed high emphasis on the values of austerity and puritanism. For a time, Aurangzeb seemed to be ruling everywhere. But while Muslims and Sikhs found their tongue due to acceptance of cultural expressions as a new value, the Punjabi Hindu stood aloof, high and dry.

Why was it the Hindu alone? Purely for the reason of lack of cultural leadership. Where was an Allama Iqbal, Faiz Ahmed 'Faiz' or even Hafiz Jullunduri? Where was Bhai Vir Singh, Nanak Singh, Kartar Singh Duggal? The Hindus had no cultural leadership of this kind. The result? Nobody could know what the Punjabi Hindu was sacrificing by disclaiming Panjabi as his language.

I am not saying that the Punjabi Hindu has made no worthwhile contribution to the culture of Punjab. Who can beat Pandit Sudarshan, Krishan Chander, Mulk Raj Anand, GD Khosla, Prakash Tandon, Chaman Nahal, Mohan Rakesh, Krishan Baldev Vaid, Krishan Sondhi and a host of others? But almost all of them worked outside Punjab. And such is the alienation implicit in the situation that their works in Panjabi translations are not available to the Punjabi reader. The only representative of Hindu sensibility they had known in recent years is Shiv Batalavi.

Not that the Panjabi-reading public has not lost anything. With a limited readership available in Panjabi, the better-known Panjabi writers are seeking the wider Hindi audience through translation. This also makes the cultural expressions lopsided and anaemic. "*Khabbal*", one of the best Panjabi short stories by any Punjabi, would require a genius to translate it if it were to convey the real atmosphere. So what they are writing in the drawing rooms is just the type of problem-oriented short stories which have no flavour of the land.

The worst example of this unrepresentative character is the Panjabi film. Even when 75 per cent of the Bombay film industry is in the hands of Punjabis, most Panjabi films provide only bad caricatures of Punjabi life in the form of all that is not at all there in Punjab. Maybe, it is for lack of audience. But, if true art is a mirror of the life behind it, then even the Punjabi intellectuals should help create a wider base for Punjabi culture. But the first and the most important need evidently is to throw up the right kind of intellectual leadership among the Punjabi Hindus.

THE ONENESS and separateness of Hindu and Sikhs is a very complex subject in which tradition, philosophy, history, geography, language, mythology, religion, politics, or in other words, almost the whole gamut of issues are too intricately interwoven. At one end of the scale emerges a picture of extreme humilation of a subject race devoid of all manliness, not allowed to keep arms or even ride a horse, and at the other an audacious general of the same race fortifying Jamrud, the Indian side of the Khyber, and the intrepid Dost Mohammed, the Amir of Kabul, trembling in his shoes or the ferocious Pathan silencing his crying child by merely utterning his name. Is it not the story of a complete metamorphosis? But how did it come about? The quintessence of the oneness and separateness of the Hindus and the Sikhs can be understood by studying this remarkable phenomenon.

There are many simplistic answers to this question. Some say that Sikhism was only another *Bhakti* cult, born out of the clash and then the synthesis between Hinduism and Islam. Some even suggest that it represents a kind of separate Punjabi nationalism. In between there is a whole range of theories. But no one tries to analyse the problem dispassionately though it has to be done so that everything falls into place, strand by strand. It is no use avoiding the issue.

Guru Nanak's metaphysics is as profound as his *Bani* (poetic composition) is simple. In fact, a real work on his highly evolved mind is yet to be written. His grasp of reality is beyond space and time. He creates a whole hierarchy of Gurus which is without parallel. His message to his Sikhs (disciples) makes every man a *Videha*, (a man in body without the constraints of a body) and yet they are committed to the individual and social well-being of both body and soul. He decries all types of exploitation—political, social and economic, in word and deed. He is a true combination of *Gyan Yoga, Raj Yoga, Bhakti Yoga, and Karma Yoga*. And then, he is the first ever philosopher to restore woman to her pristine status and thus end the tyranny built into man-woman relationship. Even Krishna had not done it. Guru Nanak's egalitarian message and practice precede those of Marx. His emphasis on the purity of means is of a much higher order than that of even Gandhi. And when the challenge comes, he manfully faces Babur and his hordes. The globe-trotter that he was, he became the first conscious *Satyagrahi* of India by being jailed at Eminabad. And over and above all this, he is a bard par excellence — a good combination of poet, composer and singer.

Have I gone astray? No, for it must be understood at the very outset that Sikhism is no ordinary theology, no ordinary church, no ordinary religion and even no ordinary way of life. But shorn of platitudes, let us see what it is.

While the Hindus considered Nanak as their Guru, the Muslims exalted him to the status of their *Pir*. Why? While the terminology of his message belonged to the Hindu tradition, his religious concepts brought him very close to Islam. Let us try to understand the latter. The five cardinal points which distinguish Islam from Hinduism are: (1) one Supreme God; (2) one book or message; (3) one prophet or messenger; (4) belief in His Grace; and (5) proselytisation. Sikhism, as it is, has all the five. There is one *Omkar*, one Guru Granth and one body of the Guru. Then day in and day out, the Sikh prays for His Grace. Besides, anyone who decides to become a Sikh is accepted as a Sikh.

The other basic difference from the Hindus is that Guru Nanak chose Panjabi as the vehicle of his message. One can say that here he emulated the Buddha. Now this is a very basic difference. To date, all forms of Hinduism use Sanskrit as their medium. In fact, one definition is that the Hindu is [illegible] dhism and Jainism in retrospect differ from Hinduism only to the extent that their religious texts are in Pali. Supposing they were in Sanskrit, then whatever be the quality of their differences, they would have stayed as Hindus only. In fact, one reason why Buddhism vanished from the land of its origin is that their later scholars and *Bhikshus* had started accepting Sanskrit as the language of that religion. Perhaps another reason was that it had kept the four-fold society intact. So, when the distinction of Pali and Sanskrit ended, the Hindus found no difficulty in accepting the limbs of their own society back into their fold. There is some parallelism in the Buddhist-Hindu society of the olden days and the Sikh-Hindu society of present-day Punjab. I have heard many Sikh friends telling me that their main fear is of losing their identity once they identify themselves with the oceanic Hinduism!

Yes, it can happen. For, in spite of these differences, Guru Nanak continued to accept the cyclical time-frame which is a unique feature of Hinduism. In fact, all church religions go by a linear time-frame which moves between creation and doomsday. This cyclical time-frame has certain very clear implications. For example, soul travels through an endless locus of life from birth to birth to finally merge with the Timeless of which it is an integral part, while all that is happening is no more than an illusion. It is as much divine in origin as the great reality itself and therefore one must ceaselessly play his part well. Now, once the operation of transmigration of soul is accepted, the relationship of *Dharma* and *Karma* becomes almost Hindu in concept. Sikhism maintains this relationship.

Moreover, though Guru Nanak attacked superstition and dogma, he nowhere gave a new concept or orientation of society. Socially, he remained a Hindu. Probably he had thought that the basic structure of Hindu society was good enough to serve the divine purpose of the Timeless and all that was required to rise above ignorance, ritual and superstition was to follow the path of enlightenment. In fact, even the basic ritual of Hinduism did not undergo any major change after Sikhism was established, until in very recent times. The reason could be that ritual itself is as rational as belief in the life process. This is mainly the reason why for all practical purposes, a Sikh and a Hindu stood inseparable, at least in the eyes of others.

All the other Sikh Gurus only elaborated upon the religion of Guru Nanak until the coming on the scene of the Tenth Guru who emerges as one of the greatest heroes born in the entire Hindudom. As Sikhism was gaining strength daybyday, it was bound to come into clash with the state. Guru Arjun's martyrdom is one of the best examples of the powerlessness of death before the immortal nature of the spirit of Man. Thereafter, it had become imperative that the Sikh Guru assume both *Miri* and *Piri*, the headship in matters both lay and spiritual. **(To be Continued)**

Reagan's Arithmetic (*from page 10*)

the Joint Chiefs of Staff showed reluctance to make any deep cuts in the US arsenal whereas the Arms Control and Disarmament Agency and the Pentagon civilians called for radically new approaches and the toughest demands on the Soviets. The State Department is supposed to have fitted in somewhere in between. As for the Soviet stance, the tenor of Ustinov's article and the latest speech by Brezhnev on the Armed Forces Day seem to indicate that hard-liners within the Soviet Union may be gaining the upper hand, in which case the Reagan proposals will have little chance of making any headway. But then, even Reagan has said that the "monumental task of reducing strategic forces to enhance stability will take many years of concentrated effort". Perhaps his Administration would also like to start afresh, despite the 12-year history of SALT, for just as he had likened his 'zero option' proposals last year to man's landing on the moon, the latest offer is supposed to "mark the commencement of a new era — in both senses of the word — a new start towards a more peaceful, more secure world"! Profound words indeed! (*May 17*)

Plight of Bonded Labour

N. LINGA MURTHY and GURAJALA SUDERSHAN

THE bondage of labourers in a country results from their inability to earn independent living caused by the mismanagement of manpower resources. Bondage never had any positive legal basis but was purely a matter of custom or social agreement. It is known by various names in different parts of the country affecting different sections of people in varying degrees.

Nearly 85 per cent of the bonded labourers in our country belong to Scheduled Castes and Scheduled Tribes.

Before Independence, the Slavery Abolition Act was passed in 1843. Despite this, the system flourished all through the British regime. After Independence, it took many years for the Government to be convinced about the existence of this evil practice. *Begar* and similar other forms of forced labour were prohibited under Article 23 of the Constitution. Notwithstanding this and several legislations adopted by the State and Union Territory administrations, the institution of bondage continues to exist in one form or another. This is because the authorities have not been very earnest about effective implementation.

It was only after passing of the Bonded Labour System (Abolition) Ordinance, 1975, which became an Act in 1976, that the question of eradication of this social evil was seriously taken up. The main provisions of the Act are to declare bonded labour free from any obligation to render any free service, manual or menial, and all such customs, traditions, contracts and agreements as applied to them were declared void. Under the Act, the State Governments may vest the District Magistrates with powers to take cognizance and prosecute offenders. There is a provision to set up vigilance committees at district and sub-divisional levels to help identify bonded labourers, advise the implementing authorities on all matters relating to the enforcement of legal provisions and for the economic and social rehabilitation of the freed bonded labourers.

Even after the promulgation of the Ordinance, the process of identification, release and rehabilitation has been tardy. Different estimates put the total figure at different levels. While the 32nd round of the NSS put it at 3.40 lakhs, the Gandhi Peace Foundation in collaboration with the National Labour Institute put it at 26,17,000. Almost all surveys on bonded labour in our country were confined to the agricultural sector although the practice is also rampant in non-agricultural sectors like mining, weaving, quarrying, brick kilns, hotels, etc. The fact is that even now the country does not know the full extent of the prevalence of this evil. This shows that the approach to the problem has been casual and half-hearted. A document, "Evaluation of the Impact of Bonded Labour Abolition ordinance of 1975 in Uttar Pradesh," a case study of four districts by the State Planning Institute of Uttar Pradesh, said that district-level authorities had no clear-cut concept of the Ordinance and of the extent of the problem. The powerful landlords have taken shelter under the loopholes in the law and have been preventing bonded labourers by threats and other means from declaring themselves as such.

One of the dimensions of the problem which is overlooked in most of the studies is the inter-State character of bondage. Bonded labourers from Orissa, West Bengal, Bihar, Tamilnadu and Andhra Pradesh will be found working at construction sites in Delhi, where Parliament members pass laws.

According to the Report of the Commissioner for Scheduled Castes and Scheduled Tribes 1975-76 and 1976-77, out of 31 States/Union Territories, 20 States/Union Territories have denied the existence of bonded labour system in their jurisdiction. However, in some of the above-mentioned States, preliminary enquiries and surveys have indicated that bonded labour system is still prevalent. The Government of Maharashtra has all along been disputing the fact of bonded labour being prevalent in that State. A quick survey in 10 villages in Nandurbar and Shahada taluks of Dhulia district conducted by the organisation of the Commissioner for Scheduled Castes and Scheduled Tribes revealed that it is prevalent on a large scale in the form of *Saldars*. The Himachal Pradesh Government was also of the view that bonded labour did not exist in that State. But a survey in that State brought out that the system is very common among Scheduled Castes and that bondage in some cases has been "inter-generational". Another State that experienced the so-called Green Revolution, Haryana, also denied the existence of this evil in its territory, but various reports indicate that it is very much present, at least in the brick kilns.

The problem of bonded labour is both economic and social, and the rehabilitation of released bonded labourers is a very important aspect. The objective of rehabilitation is to enable the freed labourer to become economically self-sufficient so that he will not get back into bondage. Under the Centrally-sponsored scheme for the rehabilitation of bonded labour, a freed bonded labourer is given agricultural land or milch animals or implements for skill-based occupations. The Central Government provides funds to the State Governments on a matching grant basis for this purpose. This scheme has been in operation from April 1979 in Andhra Pradesh, Bihar, Karnataka, Kerala, Madhya Pradesh, Orissa, Rajasthan, Tamil Nadu and Uttar Pradesh. According to the Report of the Commissioner for Sche-

Linga Murthy is Lecturer in Economics and Sudershan, Research Scholar, Kakatiya University, Warangal.

duled Castes and Scheduled Tribes 1975-76 and 1976-77 (Part I), about 98,051 bonded labourers have been identified, of whom 97,114 have been freed but only 23,270 have been rehabilitated. The State-wise position is given below.

State-wise Position of Bonded Labour

Name of State/ UT	*Identified*	*Freed*	*Rehabilitated*	*Percentage of Rehabilitated to freed*
Andhra Pradesh	826	826	698	84.50
Bihar	2,562	2,038	613	30.07
Gujarat	37	37	36	97.29
Karnataka	64,040	64,040	4,668	7.28
Kerala	702	702	186	26.49
Madhya Pradesh	1,612	1,500	33	2.2
Orissa	612	311	302	97.10
Rajasthan	5,533	5,533	2,381	43.03
Tamil Nadu	2,282	2,282	1,998	69.32
Uttar Pradesh	19,242	19,242	12,805	66.54
Mizoram	3	3	Nil	Nil
Total	98,051	97,114	23,720	24.42

The table indicates that the process of rehabilitation is very slow. Rehabilitation in States like Bihar, Karnataka, Kerala, Madhya Pradesh and Rajasthan has been very unsatisfactory. In Madhya Pradesh and Karnataka, a very low percentage of 2.2 and 7.28 were rehabilitated. On the whole, the percentage of rehabilitated to the freed worked out to only 24.42 per cent. This proves that the State Governments are not ready to wipe out this evil practice. It is also doubtful if the rehabilitated bonded labourers have really got out of the tentacles of bondage — the word rehabilitation is used in a very loose sense in terms merely of distribution of money, land, milch animals, etc. Real rehabilitation is a long-term process which must be judged by the income generated over a period of five to six years out of the productive assets given. Some of the studies revealed that the amounts spent were very meagre and the land allotted was not suitable for cultivation.

A study in Ranga Reddy district of Andhra Pradesh showed that the scale of resources given to each released bonded labourer amounted at best to partial rehabilitation. About 70 per cent of the sample beneficiaries had earnings of less than Rs. 80 per month from the rehabilitation assistance received, while nearly 50 per cent had either no return or very small earnings, say Rs 10 a month. A study in Bihar showed that though agricultural land was granted to bonded labourers roughly at the rate of 1.5 acre per family, in many cases physical possession of the land had not been given. It was also observed that most of the land was of inferior quality, and in one case the so-called agricultural land measuring 0.27 acre allotted was a 4 — 5 ft deep perennial natural pond which could not be reclaimed under any circumstances. This shows that rehabilitation projects are not properly formulated and executed.

Bonded labour is a problem calling for urgent social action. It took many years for us to recognise the existence of bondage. After recognising it and identifying bonded labourers, if rehabilitation is not done, in time and properly, the problems of these labourers will only get worse when they relapse into bondage. The powers-that-be must realise this truth and act on it. ☐

COMMUNICATION

Government Employees aad TU Struggles

THE article titled "Government Employees' Constraints" by O.P. Gupta, General Secretary of the National Federation of P & T Employees (*Mainstream*, May 1, 1982), does no justice to the Central Government employees' cause and their movement. Besides undue eulogy of Gupta's own organisation (NFPTE), the article as a whole does not reflect the true aspirations of the Central Government employees and does not present a true picture of their condition and their trade union movement.

Admitting that the Central Government employees are today the worst paid section of salaried workers, Gupta has nothing to say against the Government which has thrown its employees into such a position. The way it has been mentioned in the last but one paragraph of the article that the Government has agreed to settle by March 31, 1983, the CGE's demand for parity in wages with public sector undertakings, goes to show Gupta's illusions about the Government, and, therefore, his assertion in the last para about the NFPTE having no illusion that the Government will accept the demand out of goodwill does not carry conviction.

It may be pointed out here that according to the recommendations of the Third Pay Commission, wage revision of Central Government employees had become due in 1974, when the twelve-monthly average of the cost of living index had reached the figure of 272 on September 30, 1974. And, therefore, having agreed to defer the major demands of the Central Government employees (including wage revision) up to March 31, 1983, the NFPTE and its General Secretary have no moral authority to talk about creating sufficient pressure by organising an effective struggle. Gupta lets the cat out of the bag when he says at the end that he intends to organise such a struggle "thereafter if the Government tries to back out" — that is, the question of struggle arises only after March 31, 1983, if the Government backs out. But when the Government has not agreed to accept this demand by March 31, 1983, the question of backing out will also not arise. This is yet another trick to mislead Central Government employees by those organisations which have surrendered before the Government and agreed to defer the major demands of the employees up to March 1983, along with depositing DA arrears from August 1981 as well as increased HRA and CCA that have become payable from February 1982 following merger of DA in pay up to the average index level of 320 points.

At the very outset, Gupta has said, "Trade Unions amongst Government employees and their struggles for economic improvement are going to play a significant role in the trade union movement in the country. They will be required to bear the main brunt in the struggle against the Government's economic policies...." But in a country like ours, where more than 48 per cent of the population are below the poverty line and there is a sizeable labour fource which is not in the organised sector, any struggle against the Government's wrong economic policies has to take the shape of a united struggle of all organised and unorganised workers, the rural poor, industrial workers and Central and State Government employees. The Bombay Convention of Trade Unions held on June 4, 1981, has given a lead in this direction as the demands formulated there cover workers of all sectors and the unorganised and the poor. The Convention was organised by eight central trade unions of different political persuasions and about 40 national industrial federations, including Central Government employees' organisations. The largest mobilisation of working and poor people was done under the leadership of the National Campaign Committee set up by the Bombay TU Convention, and on its call lakhs of workers, poor people and of course Central Government employees participated in the historic march to Parliament on November 23, 1981, and there was the one-day united industrial general strike of January 19 this year.

Central Government employees could not participate in the January 19 strike due to the weakness of their own organisations. But Gupta has to blame the central trade unions and say they are not able to provide an effective lead to Central Government employees partly because of split on a political basis and partly because of the limitations imposed on the trade unions of Government employees. When trade unions of different political persuasions have come on one platform to fight the wrong economic policies of the Government and all-out attacks on trade union and democratic rights, Gupta is still talking of a split in the central trade unions on a political basis; he only wants to underline the political disunity of the central TUs and undermine the unity achieved by them despite their different political outlooks. One fails to understand why the united movement launched by the Bombay TU Convention (of which various Central Government employees' organisations are also a part) could not enthuse the Central Government employees' organisations to join the January 19 strike, when other workers, including the white-collar Bank and LIC workers, were greatly enthused by the united call and joined the strike. For this the Central Government employees' organisations have to blame themselves and not the central TUs.

Non-participation of Central Government employees in the January 19 strike could perhaps be attributed to the organisational weakness and mental unpreparedness of the Central Government employees and their organisations, but what followed soon thereafter, namely, *acceptance by some organisations of the Government's proposal to deposit the DA arrears of the instalments of August, October, November 1981 and January 1982 in the PF accounts of the employees, as also the deposit of increased HRA and CCA up to March 1983 and defer consideration of all the major demands of Central Government employees also up to March 1983, has not only gone against the interests of the Central Government employees but has done great harm to the united movement of the National Campaign Committee launched against the anti-labour policies of the Government.* And, therefore, when the leadership of the Government employees' unions is said to have been subjected to severe criticism by the leaders of the NCC representing various national trade union centres, Gupta's assertion that this has been done without realising their limitations is not correct. As a matter of fact, such criticism, if any, should be taken in the spirit of fraternity in which it has been made and honest and serious efforts should be made to pull out the Central Government employees from the situation in which they have been placed by accepting the Government's offer in the JCM by some of their organisations.

As in every other capitalist country, in India also there are several central trade union organisations and there is a multiplicity of trade unions in every industry and department. Of course, such division in the trade unions has a political basis also. But Gupta's assertion that "the bar on Government employees' organisations to affiliate themselves with national TU centres has proved a blessing in disguise as it has helped the workers in civil services to avoid split on a political basis", is not correct because there are more than one organisation in many Central Government departments, and the P & T Department is no exception. It is also not correct to say that only after the 1968 strike and later under the Janata Party some political bias was injected. Political bias started soon after the country gained Independence. This is a reformist understanding that the various central TUs have been formed on a political basis only and, therefore, workers should not associate themselves with the central TUs. This slogan is often given by the Government and perhaps encouraged by such views of some of the leaders of the Central Government employees in the JCM. Finance Minister Pranab Mukherjee dared to say in Parliament that the deposit of DA arrears and the increased HRA and CCA was a matter between the Central Government and its employees only and he would not allow "interference" by the central trade unions. The NCC has rightly condemned this slander against genuine representatives of the workers whom Mukherjee characterised as trade union wings of political parties. The NCC further made it clear that the Central Government employees are part of the Committee and they are against this unilateral decision to impose a partial wage freeze on them. The NCC has considered this attack as a precursor to similar attacks and has called upon trade unions of all affiliations to resolutely oppose this dangerous move.

It is not my aim to rebut each and every point made in Gupta's article to eulogise his own organisation, but it is too much to claim that "even in 1981, soon after the Ordinance was promulgated and before the NCC could take up cudgels, P & T workers prepared themselves to organise a non-cooperation movement. The workers' unity and determination to act was so great that Minister C.M. Stephen declared that the Ordinance was not sufficient to handle the situation." The less said the better about the so-called non-cooperation movement which was unceremoniously withdrawn by the leadership of NFPTE.

Gupta has stated that "the non-participation of Government employees in the January 19 strike and soon thereafter the acceptance of the Government's DA offer, has not only created controversy about the credibility of the movement but exposed the weakness of the whole movement." As far as the controversy over the acceptance of the Government's DA offer is concerned this could very well have been avoided by rejecting it. In that case, only organisations affiliated to the INTUC or have political leanings towards the Congress-I would have been isolated from others, which is not a new thing in the trade union movement of Central Government employees. In every struggle of the Central Government employees, whether in 1960, 1968 or 1974, such unions have always sided with the Government. Rejection of the DA offer would have also paved the ground for a united struggle of Central Government employees, whether in the JCM or outside. But acceptance of this offer by organisations like the NFPTE and AIRF has created a situation where the traditional opponents of the Government's wrong economic policies and fighters for the case of the Central Government employees find themselves divided, and in this division it is most regrettable that NFPTE and AIRF are in the same camp in which there are organisations like NFIR and other INTUC-affiliated or pro-Government organisations.

This situation has arisen because of the false notion of establishing the unity of the Central Government employees' organisations represented in the JCM only, though this too could not be achieved. The fact that there are a large number of Central Government employees' organisations with considerable following outside the JCM forum, should not be ignored. Such organisations have condemned with one voice the attempts of the Government to impound DA arrears and increased HRA and CCA and to defer the major demands of the employees till March 1983, along with some of the organisations represented in the JCM.

There is a broad consensus amongst Central Government employees' organisations, whether in JCM or outside, on some basic demands. These can well be made the basis of a united struggle of Central Government employees, against the wrong economic and anti-labour policies of the Government.

Such a fighting unity can only be established if the false notion of unity of those organisations only which are in the JCM is given up and all organisations of Central Government employees, big or small, recognised or unrecognised, whether in or outside JCM, whether affiliated to any central TU organisation or not, and regardless of their ideological approach, are brought on one platform. Such efforts have already been started by some organisations, and it is the demand of the times that all organisations of Central Government employees should be there on one platform who want to wage a united struggle to achieve the basic demands of the Central Government employees and oppose the Government's anti-labour policies.

Nuclear War and USA

The *Ground Zero* organisation has published a book (*Nuclear War: What's In It for You?* Pocket Books, New York, 1982, $2.95) dealing with the dangers of nuclear war from the US citizen's point of view. In an appendix the book contains "Twenty Questions about Nuclear War You've Been Afraid to Ask". We reproduce with due acknowledgement two of these questions with the answers provided in the volume whose purpose is to promote discussion and understanding. —Editor

Have there ever been any false alarms where our warning systems indicated a missile attack which never materialised?

Answer: Yes, several.

The best-known occurred in the mid-1960s shortly after the Ballistic Missile Early Warning System (BMEWS) was completed. One day, one of the sites indicated that a massive missile raid on the United States was taking place. Because the system was fairly new, the commander of the installation cautioned that it might be a false alarm — which of course it was. Later it was determined that what the radar had seen was the rising of the moon. The radar signals had gone all the way to the moon and bounced back. Apparently the computer programme in the BMEWS computer had never taken into account this possibility and the moon had for the first time come into the field of view of the radar. Imagine — World War III almost starting because of the moon rising.

In a 1979 incident at the Colorado Springs headquarters of the North American Air Defence Command (NORAD), a computer processing data from the satellite missile warning system failed—as frequently happens with computers. The incoming satellite data were re-routed to a backup computer, which also failed. In-coming data were then re-routed to a second backup computer, which after a short period of operation indicated a massive missile raid on the United States. Apparently a practice tape which had been used for testing air force personnel had been inadvertently left on one of the backup computer tape drives.

Within a few minutes, this error was discovered, but not before the false information had been transmitted to US military installations around the country.

In June of 1980, the computer display system at U.S. Air Force Strategic Air Command (SAC) headquarters in Omaha, Nebraska, indicated a large number of SLBM launches against the United States. (This is one of the military installations which receive warning system data directly from NORAD). A check with the NORAD command post in Colorado found no indication of any SLBM launches on its equipment. Eventually the computer display at SAC cleared and the situation returned to normal. However, in the initial confusion, the SAC duty officer directed all alert B-52 crews (over a hundred airplanes) to go to their aircraft and start their engines should a quick take-off be necessary in order to survive. None of the B-52s actually took off.

On June 6, as SAC sought to determine the source of the malfunction, the incident was repeated —this time with the indication of a number of ICBM launches Later it was determined that a "faulty integrated circuit in a communications multiplexer", that is, a faulty computer chip the size of a fingernail, was responsible for the incidents.

While there have been a few other minor incidents, those described above have been the most serious. How does it make you feel about the idea of launching US ICBMs when our warning systems indicate an attack? Does it make you wonder about the Soviet warning systems?

If there were a nuclear war with the Soviet Union, would the President of the United States survive?

Answer: Probably not.

It is almost certain that any large-scale Soviet attack on the United States would include an attack on Washington in order to disrupt the structure for commanding US military forces. If the attack were "a bolt from the blue" or if it occurred in the early stages of a crisis, the President would probably be in Washington and would be killed along with his cabinet, the Congress, and the Joint Chiefs of Staff.

While in principle the President might, upon satellite warning of an attack, run from his office, get on a helicopter, and escape the Washington area, in practice it seems highly unlikely that this would work. The time it takes for a helicopter to get to the White House (three to five minutes) and to escape the area (five to ten minutes) does not compare favourably to the time (about seven to ten minutes) between satellite warning and arrival of a ballistic missile from a submarine. If the attack were from a Soviet submarine-launched cruise missile (unlikely now but possible in the future), there would be no warning at all.

In an escalating crisis, the President would essentially have three choices: (1) remain in Washington, (2) get on board a specially equipped airplane and randomly fly around the country, or (3) go to a secret underground command post. The argument for his remaining in Washington (as Kennedy did in the Cuban missile crisis) is that his departure could panic the nation or lead to an escalation in the crisis. The special airplane, the National Emergency Airborne Command Post (NEACP — often referred to as Kneecap), is a 747 which can, in principle, stay aloft for as long as three or four days as long as refueling is available (oil supply problems necessitate landing after this period). During a large-

Disarmament *(from page 14)*

or nuclear war command and control infrastructure on their soil, train their troops in the use of nuclear weapons and take part in the nuclear-weapon targeting plans. In other words, they are to all intents and purposes nuclear-weapon powers excepting they do not have the legal title to the weapons. It is like a person having a borrowed revolver and maintaining he is unarmed because he did not buy the revolver and the licence is not in his name. This also explains why Governments of so-called non-nuclear nations are enthusiastic about having theatre missiles on their soil or allowing home-port facilities for nuclear-weapon carriers. In the light of their vested interest to legitimise nuclear weapons it is not surprising that the industrialised countries belonging to NATO and ANZUS and Japan have opposed the resolution of the non-aligned nations to declare the use and threat of use of nuclear weapons as a violation of the UN Charter and a crime against humanity.

Like the NPT, the nuclear-weapon-free zone proposals and full-scope safeguards are steps to legitimise the nuclear weapons in the hands of the nuclear-weapon powers and privileged position and technological hegemony in the international community. Nuclear weapon-free zone proposals amount to establishment of a protectorate by the nuclear-weapon powers over the non-nuclear-weapon powers who accept guarantees. Pax Britannica and Pax Americana are to be succeeded by Pax Atomica. This again implies acknowledgement of the legitimacy of nuclear weapons in the arsenals of the nuclear-weapon powers. Similarly full-scope safeguards impose the hegemony of the nuclear-weapon powers and the allied crypto-nuclear-weapon powers. If in order to obtain nuclear energy technology non-nuclear-weapon powers are to accept safeguards on the non-diversion of the technology to military purposes, by the same logic industrialised powers importing energy source material should be subjected to safeguards that the energy generated is not diverted to military purposes, especially for manufacture of weapons of mass destruction.

Slowly and steadily through these and other measures the world is being conditioned to accept the legitimacy of the use of nuclear weapons and chemical weapons. Repeatedly it has been highlighted that doctrines of use of nuclear weapons in conflicts involving nuclear-weapon powers on both sides do not make sense as they would result in mutual annihilation. Similarly the use of chemical weapons will invite retaliation in kind and will confer no particular advantage to the side initiating its use. However, in conflicts where only one side has such weapons and the other side has not, such weapons can be used with devastaing advantage. Neutron weapons and nerve gases will be ideal to clear oilfields. The world has been witness to nuseize blackmail when one side had overwhelming superiority or near-monopolistic possession of nuclear weapons.

It is in this context of possible nuclear blackmail that the kind of guarantees offered by nuclear-weapon powers to non-nuclear-weapon powers are a matter of serious concern. Of the five nuclear-weapon powers the US states that it will not use.

> nuclear weapons against any non-nuclear-weapon state party to the Nonproliferation Treaty or any comparable internationally binding commitment not to acquire nuclear explosive devices, except in the case of an attack on the United States, its territories or armed forces or its allies by such a state allied to a nuclear-weapon state or associated with a nuclear-weapon state in carrying out or sustaining the attack.

It is not clear that attack on US armed forces when they are aggressors will not invite nuclear retaliation. The phrase "associated with" is vague and any nation can always be charged with being associated with a nuclear-weapon state. In other words, the guarantee is not meaningful, and allows the US complete freedom to use nuclear weapons against a non-nuclear-weapon state at the moment and in circumstances of its choice. The same is true of the United Kingdom. Nuclear threats may not be credible as between two nuclear-weapon powers and nuclear war doctrines may not make much sense in the confrontation of the super-powers but they do make sense in the context of threats or use by nuclear-weapon powers against non-nuclear-weapon powers.

The continued attempts at legitimising nuclear weapons is a matter of grave concern for the developing nations—especially those which supply vital raw materials and energy source materials to industrialised countries. Of late a concept of non-military threats to national interests and the well-being of industrialised countries has been developed. Threats were held out that attempts at strangulation of industrial economies by withholding oil supplies will be met with force. One observer, Prof. Guy Pauker of the Rand Corporation has pointed out:

> The North-South conflict should not be perceived as a temporary clash of interests produced by the fourfold increase in the price of oil since 1973, but as the expression of a much deeper conflict...An increasingly determined campaign is being waged by the Third World through a variety of overlapping groupings for the establishment of a New International Economic Order. Although its articulated demands are economic, the general thrust of the movement is political, aiming at a major modification of the power relations between the former colonial powers who are at present the most advanced industrial societies and the former colonies who are still in the early stages of modernisation and industrialisation. What the North-South conflict actually involves is a struggle for the world product, which is not likely to be resolved by a few brief summit meetings. The struggle will probably continue for a long time with periods of negotiations interspersed with crises and confrontations... Nations, like individuals, do not divest themselves voluntarily of their accumulated wealth and their sources of income merely in response to moral appeals. If they have the power to resist demands on their assets the American people will probably expect their Government to negotiate from a position of strength, and if they lack the power needed for the protection of their interests, they will hold their Government accountable for having failed to maintain its preparedness.
>
> This does not imply that the American people will necessarily engage in decades of conflict with the Third World over the division of the global product. Eventually, through the evolution of public opinion, a gradual

> process of accommodation may well occur, but the time for reconciliation is not yet ripe and a period of economic confrontation between North and South is likely to be an important dimension of the transitional crisis that the world may be facing in the 1980s...
> Even the most imaginative humanitarian scholars concerned with the peaceful transformation of the prevailing world order do not expect that a new international system can be created before the end of this century. It seems therefore prudent to assume that, regardless of what the more distant future has in store for mankind the impending transitional crisis could generate considerable international turbulence. *(Military Implications of a World Order Crisis in the Eighties*, 1977).

On the basis of systematic research, which identified 215 incidents since the end of World War II in which US forces were used as a political instrument, the Brookings Institution concluded recently that the armed forces should not be used for political objectives abroad except under very special circumstances. The study established nevertheless that

> demonstrative use of the armed forces can sometimes be an effective way — at least in the short term — of securing US objectives and preventing foreign situations inimical to US interests from worsening...Under contingencies more harmful to its way of life than the 215 incidents between 1946 and 1975, the United States may not have the choice of using force only under very special circumstances. In a harsh international environment, a credible capability to use coercive diplomacy may become a major national security requirement.

The motives behind the Rapid Deployment Force and the presence of extra-regional powers in the Indian Ocean littoral can be derived from the above approach to international relations of some of the most powerful nations of the world.

The above account would explain the differences in approach to disarmament till recently between the industrialised countries and developing countries. Among the industrialised countries there was a sense of complacency that King Atom had preserved peace in that part of the world and they were able to combine a high defence expenditure with a high growth rate. The wars occurred in the developing world, interventions by industrialised countries happened there, threats of asymmetric use of nuclear, chemical and other sophisticated weapons were held out to those nations, and lastly, nations struggling with problems of development found the defence expenditure burdensome. Therefore, the developing world had a meaningful stake in disarmament. This dichotomy in approach was reflected in the deliberations of the First Special Session on Disarmament of the UN General Assembly and also in the proceedings of the conference of the Committee on Disarmament in Geneva.

Of late however, a radical change in attitudes has come about in the West at the grassroots level, and there is a popular upsurge against continuing the arms race. The demand is now for a freeze of nuclear armaments as a first step towards negotiating arms control and arms reduction measures. Two major factors explain this change.

First, the industrialised world today is in a major crisis. The unemployed in the OECD countries exceed 24 million and almost all those countries are in a recession threatening to turn into a depression. The era of cheap energy is over. Growth rates had significantly come down in the seventies and it no longer appears feasible to combine high defence expenditure with high growth rate. There are now pressures in various European countries to reduce defence expenditure. As the UN Study on the Relationship Between Disarmament and Development Observes,

> the world can either continue to pursue the arms race with characteristic vigour or move consciously and with deliberate speed towards a more stable and balanced social and economic development within a more sustainable international economic and political order. It cannot do both. It must be acknowledged that the arms race and development are in a competitive relationship, particularly in terms of resources but also in the vital dimension of attitudes and perceptions.

The Report emphasises,
